mighty intellect. He {122} had read extensively, pondered deeply, and taken immense pains in polishing his style. He could scarcely, indeed, be called a learned man, in the technical sense of the term, but he was well informed. We could have wished that he had possessed wider sympathies with earnest seekers after truth in all ages, but this was not in the nature of the man. His knowledge of Greek was very imperfect at this time (he afterwards renewed his acquaintance with that language); what he knew of Greek philosophy was chiefly through Cicero (his very pictures of the Stoics and Epicureans are Roman rather than Grecian), and he never entered into the spirit of such deep and earnest thinkers as Socrates, Plato, and Aristotle, -- he tells us somewhere that the fame of Aristotle is utterly decayed. In respect even of modern writers, he never comprehended the profundity of such men as Cudworth and Descartes in the previous century; and he had no appreciation of the speculations of Clarke and Leibnitz, who lived in the age immediately preceding his own. He belongs to the cold, elegant, doubting, and secular eighteenth century; and, setting little value on antiquity, he builds for the present and the future on the philosophy of his own time.

As to style, which he greatly cultivated, the models which he set before him were the Roman prose writers, the French authors of his own day, and the Englishmen who were introducing the French clearness and point, such as Shaftesbury, Bolingbroke, and Pope, -- he says: " The first polite prose we have was written by Swift." Though he took great pains, he never altogether succeeded in weeding out his Scotticisms, nor in acquiring a genuine English idiom; but his style is always clear, manly, and elegant, and worthy of his weighty thoughts. When he broke down his elaborate treatise into smaller ones, he endeavored to catch the ease and freedom of the lighter French literature; but neither the subjects discussed nor the ideas of the author admit of such treatment; and though the essays are more ornate, and have more attempts at smartness and repartee, the student will ever betake himself to the treatise, as containing the only systematic, and by far the most satisfactory statement of his views.

He is now publicly committed to a theory, and he adheres to it resolutely and doggedly. In after years he said: " So {123} great an undertaking, planned before I was one-and-twenty, and composed before twenty-five, must necessarily be very defective. I have repented my haste a hundred and a hundred times." But this refers to the form and style, not the matter. He never abandoned nor modified the scepticism advanced in the early work. When he failed in obtaining a hearing for his views in the more elaborate treatise, he set them forth in " Essays," which might be more attractive to the general reader. He had instituted an inquiry, and satisfied himself that speculative truth was unattainable, either in philosophy or theology , owing to the weakness of the human intellect, and he did not wish to be disturbed with questionings. He seems to have studiously abstained from speaking on such subjects in social intercourse, except at times, in a tone of playful humor, not meant to be offensive; and on becoming an author he

formed the resolution " never to reply to anybody." He rather delighted to associate with ministers of religion, such as Robertson, Blair, and Carlyle, whom he reckoned moderate and tolerant, and helpful in producing a religious indifference; but he never allowed them to try to convert him to the truths of natural and revealed religion which they held by; and when Dr. Blair ventured on one occasion to make the attempt, he received such a reply as prevented the repetition of it on any future occasion. There are traditions of him and Adam Smith conversing familiarly on such subjects on the sands of Kirkcaldy, and of Hume succeeding in bringing his friend over to infidelity; but we have no authenticated record of Hume ever opening to any human being the religious or irreligious convictions of his soul. A good-natured and sociable man, kind and indulgent to those with whom he came in contact, he passed through life a solitary being, certainly with no God, and apparently with no human being to whom to unbosom himself.

Having set the matured and confirmed man before our readers, we have no intention of detailing minutely the events of his future life. Having published his work, he retired to Ninewells to wait the result. "Never literary attempt was more unfortunate than my `Treatise of Human Nature.' It fell deadborn from the press without reaching such distinction as even to create a murmur among the zealots." He evidently felt the {124} disappointment. "I am out of humor with myself." He was amazed that the liberty he had taken with all established truth had not created a sensation. But he was conscious of intellectual power: he had laid his plan for life; and he indomitably persevered in his literary career. Next year he published the third volume of his treatise, that on ethics, with no better success. In 1741 he printed at Edinburgh the first, and in 1742 the second, of his " Essays Moral and Political." The work was favorably received and he was encouraged. In 1744 he was anxious to be appointed Professor of Moral Philosophy in the University of Edinburgh, but public sentiment could not bear the idea of one so sceptical being appointed a teacher of youth. He was a younger brother without a profession, and he wished to have a competency; and so in 1745, the year of the rebellion of Prince Charles, he became the companion and guide of the weak-minded Marquis of Annandale. The engagement brought him some accession of fortune, but terminated abruptly from the caprice of the Marquis. In 1747 he attended General St. Clair in his military embassy to the Courts of Vienna and Turin. There he saw a variety of life; and he congratulates himself that when the engagement closed, he was " master of near a thousand pounds." In 1748 he cast the first part of his unfortunate treatise in a new form, in the "Inquiry concerning Human Understanding," but the work failed to excite any interest. His brother at Ninewells having married in 1751, his place of residence was now Edinburgh, where he was appointed to, and held for five years, the office of librarian to the advocates' library, a situation which brought him little or no emolument. In 1752 he published in Edinburgh the second part of his essays, being his " Political Discourses." This work was immediately received with acclamation; and, being translated into French, it procured him a high reputation, and in fact awakened those discussions which issued in making political

economy a science in the " Wealth of Nations." Whatever merit Hume may have in demolishing error, he has, I believe, established very little positive truth: what he effected in this way was done in political economy. The same year he published his " Inquiry concerning the Principles of Morals," being an improved version of the third part of his treatise. " Meanwhile my bookseller, A. Millar, informed me that my {125} former publications (all but the unfortunate treatise) were beginning to be the subject of conversation, that the sale of them was gradually increasing, and that new editions were demanded. Answers by reverends and right reverends came out two or three in a year; and I found, by Dr. Warburton's railing, that the books were beginning to be esteemed in good company." He had long had the idea of writing some historical work, and from the time of his being appointed librarian to the well-stored advocates' collection of books, he formed the plan of writing the " History of England." The first volume commenced with the accession of the house of Stuart, but was received so coldly that in a twelvemonth the publisher sold only forty-five copies. Nevertheless he persevered, bringing out volume after volume, till at last the great merits of the work were acknowledged. This perseverance in his life plan, in spite of discouragements, I reckon as the noblest feature in Hume's character. It does not concern us here to speak of the excellencies and defects of the history. It could be shown that the prejudices running throughout it were his constitutional and hereditary ones, and that the work, as a whole, is an illustration of his metaphysical and ethical theory.

In 1763 he received from the Earl of Hertford an invitation to attend him on his embassy to Paris. His visit to the capital of France on this occasion deserves a special notice. It may be doubted whether there ever were such compliments paid to any literary man. Dukes, mareschals, foreign ambassadors, vied with each other in honoring him. The famous men, whose persons and conversations he liked best, were D'Alembert, Marmontel, Diderot, Duclos, Helvetius, and old President Henault; and he writes to Dr. Blair, and bids him tell Dr. Robertson that there was not a single deist among them, meaning that there was none of them but went farther. He met also with Buffon, Malesherbes, Crebillon, Holbach, Renauld, Suard, and Turgot.

But he was the special favorite of the ladies, who at that time ruled the fashion in Paris. In particular, he was flattered and adored by the Countess de Boufflers. His correspondence with that lady had commenced in 1761. She addressed him first, declaring the admiration which, your sublime work (the `History of England') has awakened in me." "I know no terms {126} capable of expressing what I felt in reading the work. I was moved, transported; and the emotion which it caused me, is in some measure painful by its continuance. It elevates the soul it fills the heart with sentiments of humanity and benevolence it enlightens the intellect, by showing that true happiness is closely connected with virtue; and discovers, by the same light, what is the end, the sole end, of every reasonable being"! In truth, I believed I had before my eyes the work of some celestial being, free from the passions of humanity, who,

for the benefit of the human race, has designed to write the events of these latter times"! The philosopher is evidently gratified. " What new wonder is this which your letter presents to me? I not only find a lady, who, in the bloom of beauty and height of reputation, can withdraw herself from the pleasures of a gay court, and find leisure to cultivate the sciences, but deigns to support a correspondence with a man of letters, in a remote country, and to reward his labors by a suffrage the most agree able of all others to a man who has any spark of generous sentiment or taste for true glory." This lady, it is proper to say in plain terms, was the wife of the Comte de Boufflers, still alive, but the mistress of the Prince of Conti, who superintended for the king that mean diplomatic correspondence which he carried on unknown to his ministers. Hume might also be seen attending the evening <salons> of Madame Geoffrin, who had been the daughter of a <valet de chambre>, and was now the centre of a circle of artists and men of letters. He also waited on the entertainments of the famous Mademoiselle de l'Espinasse, who, originally an illegitimate child, had raised herself by being, first, the humble companion, and then the rival of Madame Du Deffaud, and was well known to have been the mistress of a number of successive or contemporaneous lovers. There must have been something in the philosophy of Hume which recommended him to so many ladies of this description. We believe they were glad to find so eminent a philosopher, with a system which did not seem to bear bard upon them. The courtiers told him that Madame de Pompadour " was never heard to say so much to any man."

He says of himself: " I eat nothing but ambrosia, drink nothing but nectar, breathe nothing but incense, and tread on nothing but flowers. Every man I meet, and still more every lady, {127} would think they were wanting in the most indispensable duty if they did not make a long and elaborate harangue in my praise." Lord Charlemont has given us a picture, or rather a caricature, of his person as he met him at Turin some years before this. " His face was broad and flat, his mouth wide, and without any other expression than that of imbecility. His eyes vacant and spiritless, and the corpulence of his whole person was far better fitted to communicate the idea of a turtle-eating alderman than of a refined philosopher. His speech in English was tendered ridiculous by the broadest Scotch accent, and his French was, if possible, still more laughable." This was the man who was made by the Parisian ladies to take the part, in an acted tableau, of a sultan assailed by two female slaves: " On le place sur un sopha entre les deux plus jolies femmes de Paris, il les regarde attentivement, il se frappe le ventre et les genoux A plusieurs reprises, et ne trouve jamais autre chose a leur dire que, -- `Eh bien! mes demoiselles. . . . Eh bien! nous voila donc. . . . Eh bien ! vous voila. . . . vous voila ici.'" His good sense led him to see the vanity of all this: but he was pleased with it; and he often expresses a wish to settle in Paris, or somewhere in France.

When he was introduced to the Dauphin, his son, afterwards the unfortunate Louis XVI., but then a boy of nine, stepped forth, evidently by instruction, and told him

how many friends and admirers he had in the country, and that he reckoned himself among the number from the reading of many passages in his works. The Comte de Provence (who, after his long exile, became Louis XVIII.),a year or so younger, now approached Hume, and told him he had been long and impatiently expected in France, and that he anticipated great pleasure from reading his fine history. Even the Comte d'Artois, afterwards Charles X., but then a boy of six, had to mumble a panegyric. A wise man learned in providence might have seen that awful miseries must issue from a state of things in which, as Horace Walpole pointedly expresses it, " There is a God and the king to be pulled down first, and men and women are devoutly employed in the demolition," while princes were taught to cherish the viper that was to sting them. It would have been an appropriate punishment to have got Hume placed, half a century later, in the scenes of the French Revolution, to let him eat the fruit of the seed he had helped to sow. {128}

But what, it may be asked, did be think of the state of society in which he had to mingle? It is evident that he was horrified at times with the proclaimed atheism of men and women. But what did he think of the morality of the circles in which he moved, more especially of the loose relationship of the marriage tie? Did his utilitarian theory of morals, of which he surely knew the bearing and tendency, allow of such a state of things? It is certain that Hume uttered no protest at the time, and he has left behind no condemnation of the morality of France, while he was fond of making sly and contemptuous allusions to the manifestations of religious zeal in his own country. The tone of morality in France could never have been amended by him, nor, we venture to say, by any utilitarian. When the husband of Madame Boufflers dies, he writes to her as a person now within reach of honor and felicity; that is, as likely to be married to the Prince de Conti. However, the prince declines, and Hume gives her wise enough counsel: gradually to diminish her connection with the prince, and at last to separate from him; and, he says: " If I could dispose of my fate, nothing would be so much my choice as to live where I might cultivate your friendship. Your taste for travelling might also afford you a plausible pretence for putting this plan in execution; a journey to Italy would loosen your connections here; and, if it were delayed, I would, with some probability, expect to have the felicity of attending you thither." One can picture the scene; the countess travelling with Hume attending her. But the prospect had not such attractions as to induce her to leave the prince. Hume continued his correspondence with her; and, on hearing of the death of the Prince of Conti, wrote her within a few days of his own death, knowing he was dying, and expresses no condemnation of her past conduct. The question arises whether this would be the moral tone allowed in a community in which the word of God is discarded, and utilitarian principles are adopted?

We do not mean to discuss the miserable quarrel between him and Rousseau. His attention was called to the alleged ill usage of Rousseau by Madame de Boufflers, who described him as a noble and disinterested soul, " flying from intercourse with the world," and " feeling pleasure only in

solitude." Hume, believing him to be persecuted, exerted himself to help him. {129} But his morbid vanity and intolerable habits (he insisted in taking his disgusting governante with him when he visited a family) rendered it impossible to befriend him. Unwilling to allow himself to think, or let others conclude, that he was indebted to any one, he repaid Hume's manly and delicate kindness with suspicion; and Hume, who began by describing him as a man whose modesty proceeded from ignorance of his own excellence," ended by declaring him to be " the blackest and most atrocious villain beyond comparison that now exists in the world." It is justice to Hume to say that he was always kind to persons of literary ability. Thus, he interested himself much in Thomas Blacklock, a blind man, of some poetical talent, when the people of Kirkcudbright declined to accept him as their minister. He also did all in his power to bring into notice the publications of Robertson, Adam Smith, and Ferguson.

By his connection with the embassy and the sale of his works, which had become great, he now attained a competency which made him feel independent. He had many temptations to settle in France, but old associations drew him back to Scotland. It was proposed by Lord Hertford to send him to Ireland as Secretary; but the Irish would not receive him, because he was a Scotchman. It was on this occasion that the Princess Amelia said that she thought the affair might be easily accommodated. "Why may not Lord Hertford give a bishopric to Mr. Hume?" In 1767-68 he was appointed by Lord Conway Under-Secretary of State, and had charge of Scottish affairs, including the patronage of churches But his residence was now mainly in Edinburgh, first in the old town, afterwards in a house which he built in the new town, in St. David Street, so called as the name had been chalked on the wall by a witty young lady as she passed. Here he was the acknowledged chief of a literary circle, embracing men of considerable eminence, such as Robertson, Blair, Lord Kames, Adam Ferguson, and Adam Smith at Kirkcaldy, who all looked up to him with respect. He rather enjoyed being an object of wonder to the multitude beyond the favored circle in which he mingled, and made many jocular remarks about the unpopularity of his opinions. Good-natured, sociable, and avoiding controversy, he suffered few annoyances {130} because of his scepticism -- certainly none that deserved to be called persecution. For we suppose it will be scarcely reckoned as such, that, on one occasion, in picking his steps from his lodging in the old town to the house he was building in the new, he fell into a swamp, and, observing some Newhaven fishwives passing, he called to them for help, but on learning that it was Hume the unbeliever who was in such a plight, they refused to aid him till he said the Lord's prayer. He carried on a pleasant correspondence with Sir Gilbert Elliott of Minto, with Mure of Caldwell, and others of a literary or philosophic taste. He lived on familiar terms with several of the moderate clergy, such as Robertson and Blair, and at times mingled in their ecclesiastical counsels. Many of the younger ministers reckoned it an honor to be admitted to his society, and he encouraged them to associate with him. These circumstances have led some to think that the leading moderate ministers of that period must have been infidels in secret, and acting

hypocritically in professing Christianity; but there is no ground for such a charge: they believed sincerely in the doctrines of natural religion, and in the Word of God as inspired to teach a pure morality and the immortality of the soul. But it is equally clear, that they had no faith in the peculiar Bible doctrines of grace; and Hume was delighted to find them frowning on all religious earnestness, and advancing so rapidly on the road to deism and philosophic indifference.

By April, 1776, Hume knew that he would not recover from the disease with which he had been afflicted for two years, being a disorder in the bowels. He bought a piece of ground in the new church-yard in the Calton Hill as a burying-place, and left money for the erection of a small monument, with the simple inscription, " David Hume." lie wrote " My Own Life," giving an account of his literary career. In his will Adam Smith had been appointed his literary executor, and two hundred pounds had been bequeathed to him for the pains he might take in correcting and publishing his " Dialogues on Natural Religion," a work written before 1751, but not yet given to the world. But he had ground for fearing that Smith might be unwilling to take the odium of editing such a work, and so he took effectual steps to guard against its suppression. He came to {131} an understanding with Smith on the subject, and in a codicil to his will, dated August 7, he left the manuscripts to Strahan the publisher, ordaining " that if my `Dialogues' from whatever cause be not published within two years and a half after my death, as also the account of my life, the property shall return to my nephew David, whose duty in publishing them, as the last request of his uncle, must be approved of by all the world." Strahan was as indisposed as Smith to undertake the responsibility of publishing so offensive a work. The truth is, Hume's Scottish friends, though they had abandoned Christianity, were most anxious to have left to them a natural religion, in which they might find a refuge and some comfort; and in the "Dialogues" Hume had undermined this last support. The " Dialogues " were published in 1779 by the author's nephew.

In April he took a journey to Bath for the benefit of his health, but with no hope of ultimate recovery. John Home, the author of " Douglas, a Tragedy," travelled with him, and has preserved a diary. He talked cheerfully of the topics of the day, and of his favorite subjects, lamenting over the state of the nation, and predicting that the national debt must be the ruin of Britain. He returned to Edinburgh about the beginning of July. Dr. Cullen reports: " He passed most part of the day in his drawing-room: admitted the visits of his friends, and with his usual spirits conversed with them upon literature, politics, or whatever was accidentally started." Colonel Edmonstoune had come to take leave of him Hume said he had been reading a few days before, Lucian's Dialogues of the Dead," and, among all the reasons for not entering readily into Charon's boat, he could not find one that fitted him, and he invented several peculiar ones to give the boatman. " I might urge, I Have a little patience, good Charon: I have been endeavoring to open the eyes of the public. If I live a few years longer, I may have the satisfaction of seeing the downfall of some of

the prevailing systems of superstition.' But Charon would then lose all temper and decency: `You loitering rogue, that will not happen these many hundred years. Do you fancy I will grant you a lease for so long a term ? Get into the boat this instant, you lazy, loitering rogue.'" All this is evidently very gratifying to the colonel. Dr. Black reports that he " passes his time very well with the assistance of amusing books." {132} Dr. Cullen continues: "For a few days before his death, he became more averse to receive visits; speaking, became more and more difficult to him; and for twelve hours before his death his speech failed him altogether. His senses and judgment did not fail till the last hour of his life. He constantly discovered a strong sensibility to the attention and care of his friends, and, amidst great uneasiness and languor, never betrayed any peevishness or impatience."

This was the account left by his literary friends, and it was matter of triumph to them that he betrayed no signs of fear in his hour of weakness. Are we to allow, that, as in the early ages of the world's history, those who did not like to retain God in their knowledge continued all their lives in the most abject superstition , so in these last days, under other influences, there may be persons so bewildered that they die as they live, without any fixed religious belief? The fact, if it be a fact, is not flattering to the race; nor is the prospect encouraging. Good Christians had hoped, that ere he left the world there might be a change of sentiment, and an acknowledgment of the existence of God, and the need of a Saviour. Many of them maintained that it was impossible for an infidel to die in peace, and it was reported among religious circles, that, though he was cheerful when his unbelieving friends visited him, he had terrible uneasiness when left alone. Some of these rumors utterly break down when we try to trace them to their original sources. The statement, however, of Mr. Robert Haldane of Airthrey, as to what he learned from his neighbor, Mr. Abercromby of Tullibody, must contain some truth. Mr. Abercromby was travelling to Haddington in a lumbering stage-coach. " The conversation during the tedious journey turned on the death-bed of the great philosopher, and as Mr. Abercromby's son-in-law, Colonel Edmonstoune of Newton, was one of Hume's intimate friends, he had heard from him much of the buoyant cheerfulness which had enlivened the sick room of the dying man. Whilst the conversation was running on in this strain, a respectable-looking female, dressed in black, who made a fourth in the coach, begged permission to offer a remark: `Gentlemen,' she said, `I attended Mr. Hume on his death-bed, but, I can assure you, I hope never again to attend the death-bed of a philosopher.' {133} They then cross-examined her as to her meaning; and she told them that, when his friends were with him, Mr. Hume was cheerful even to frivolity, but that when alone be was often overwhelmed with unutterable gloom, and had in his hours of depression declared that he had been in search of light all his life, but was now in greater darkness than ever." This is Mr. Haldane's statement, as taken from Mr. Abercromby.[35] We confess we should like to know more of this woman in black, and to have taken part in the cross-questioning. The question is left in that region of doubt where Hume himself left all religion. He died on

Monday, August 26, 1776, at four o'clock in the afternoon.

Everybody knows that Hume was a sceptic. It is not so generally known that he has developed a full system of the human mind. Students of philosophy should make themselves acquainted with it. It has in fact been the stimulating cause of all later European philosophy: of that of Reid and his school of that of Kant, and the powerful thinkers influenced by him and of that of M. Cousin, and his numerous followers in France, in their attempt to combine Reid and Kant. Nor is it to be omitted that Mr. J. S. Mill, in his " Examination of Hamilton," has reproduced to a large extent the theory of Hume, but without so clearly seeing or candidly avowing the consequences. I rather think that Mr. Mill himself is scarcely aware of the extent of the resemblance between his doctrines and those of the Scottish sceptic; as he seems to have wrought out his conclusions from data supplied him by his own father, Mr. James Mill, who, however, has evidently drawn much from Hume. The circumstance that Mr. Mill's work was welcomed by such declamations by the chief literary organs in London is a proof, either that the would-be leaders of opinion are so ignorant of philosophy that they do not see the consequences; or that the writers, being chiefly young men bred at Oxford or Cambridge, are fully prepared to accept them in the reaction against the revived mediaevalism which was sought to be imposed upon them. In no history of philosophy that we are acquainted with is there a good account of the system of Hume. As few persons now read, or in fact ever did read, through his weighty {134} volumes, we are in hopes that some may feel grateful to us, if in short space we give them an expository and critical account of his philosophy, with a special facing towards the philosophy which has been introduced among us by the British section of the nescient school of Comte.

Hume begins thus his famous "Treatise of Human Nature:" "All the perceptions of the human mind resolve themselves into two distinct kinds, which I call <impressions> and <ideas>. The difference betwixt them consists in the degrees of force and liveliness with which they strike upon the mind, and make their way into our thought or consciousness. Those perceptions which enter with most force and violence, we may name <impressions>, and under this name I comprehend all our sensations, passions, and emotions, as they make their first appearance in the soul. By <ideas>, I mean the faint images of these in thinking and reasoning; such, for instance, are all the perceptions excited by the present discourse, excepting only those which arise from the sight and touch, and excepting the immediate pleasure or uneasiness it may occasion." He tells us, that, in the use of terms, " I rather restore the word <idea> to its original sense, from which Mr. Locke had perverted it, in making it stand for all our perceptions." This theory is certainly very simple, but surely it is lamentably scanty. It will not do to place under the same bead, and call by the one name of <impressions>, two such things as the affections of the senses on the one hand, and the mental emotions of hope, fear, joy, and sorrow, on the other. Nor can we allow him to describe all our sense-perceptions by the vague name of impressions. What is meant by impressions? If the word bas

any proper meaning, it must signify that there is something impressing, without which there would be no impression, and also something impressed. If Hume admits all this to be in the impression we ask him to go on with us to inquire what is in the thing impressed and in the thing that impresses, and we are at once in the region of existences, internal and external. " I never," he says, " catch myself at any time without a perception, and never can observe any thing but the perception." His very language contradicts itself. He talks of catching <himself>. What is this <self> that he catches? But he may say it is only a perception. I reply that there is more. We never observe {135} a perception alone. We always observe self as perceiving. It is true that I never can catch myself at any time without a perception; but it is quite as certain, and we have the same evidence for it, that we never observe a perception except when we observe self perceiving. Let us unfold what is in this self, and we shall find that it no way resembles an impression, like that left by a seal upon wax.[36] In regard to certain of our perceptions, those through the senses, we observe not only the self perceiving, but an object perceived.

He now explains the way in which <ideas> appear. By memory the impressions come forth in their original order and position as ideas. This is a defective account of memory, consciousness being the witness. In memory, we have not only a reproduction of a sensation, or, it may be, a mental affection, we recognize it as <having been before us in time past>. Of all this we have as clear evidence as we have of the presence of the idea.[37] In imagination the ideas are more strong and lively, and are transposed and changed. This, he says, is effected by an associating quality; and he here develops his account of the laws of association, which has been so commended. But the truth is, his views on this subject, so far from being an advance on those of Hutcheson, are rather a retrogression: they are certainly far behind those of his contemporary Turnbull. He seems to confine the operation of association to the exercise of imagination: he does not see that our very memories are regulated by the same principle; nay, he allows that the imagination can join two ideas without it. The associating qualities are said by him to be three in number: resemblance, contiguity in time or place, and cause or effect. "I do not find," he says, "that {136} any philosopher has attempted to enumerate all the principles of association." But the classification propounded by him bears so close a resemblance to that of Aristotle, that we must believe that the one given by the Stagyrite had, in the course of his reading, fallen under his notice, though he had forgotten the circumstance. The difference between the two lies in Hume giving us cause and effect, instead of contrast as proposed by the Greek philosopher. It has often been remarked that Hume's arrangement is redundant, inasmuch as cause and effect, according to him, are nothing but contiguity in time and place.

He now shows how our complex ideas are formed. Following Locke, he represents these as consisting of substances, modes, and relations. He dismisses substance very summarily. He proceeds on the view of substance given by Locke, one of the most defective and unsatisfactory parts

of his philosophy. Locke stood tip for some unknown thing, called substance, behind the qualities. Berkeley had shown that there is no evidence of the existence of such a substratum. Hume assumes that we have no idea of external substance different from the qualities, and he proceeds to show that we have no notion of the substance mind distinct from particular perceptions. " I believe none will assert that substance is either a color, or a sound, or a taste. The idea of substance must therefore be derived from an impression of reflection, if it really exist. But the impressions of reflection resolve themselves into our passions and emotions, none of which can possibly represent a substance." A substance is thus nothing else than a collection of particular qualities united by the imagination. He thus suits the idea to his preconceived theory, instead of looking at the peculiar idea, and suiting his theory to the facts. I give up the idea of an unknown substratum behind the qualities. I stand up only for what we know. In consciousness, we know self, and in sense-perception we know the external objects as <existing things exercising qualities>. In this is involved what I reckon the true idea of substance. We can as little know the qualities apart from an object exercising them, as we can an object apart from qualities. We know both in one concrete act, and we have the same evidence of the one as the other.

When he comes to modes, he examines them by the doctrine {137} of abstract or general ideas propounded by Berkeley, which he characterizes "as one of the greatest and most valuable discoveries that has been made of late years in the republic of letters." According to this very defective theory (as it appears to us), all abstract or general ideas are nothing but particular ones annexed to a certain term. Like Locke, Hume confounds abstract and general ideas, which should be carefully distinguished: the former meaning the notion of the part of an object as a part, more particularly an attribute; the other, the notion of objects possessing common attributes, the notion being such that it embraces all the objects possessing the common attributes. Abstraction and generalization are most important intellectual operations, the one bringing specially to view what is involved in the concrete knowledge (not impression) of the individual, and the other exhibiting the qualities in respect of which objects agree. Without such elaborative processes, we should never know all that is involved in our original perceptions by sense and consciousness. Nor is it to be forgotten, that when the concrete is a real object, the abstract is a real quality existing in the object; and that when the singulars are real, the universal is also real, that is, a class all the objects in which possess common qualities. Here again we find Hume overlooking one of the most essential of our mental attributes, and thus degrading human intelligence. In relation to the particular end for which he introduces his doctrine, I hold that substance and mode are known in one concrete act and that we can separate them by abstraction for more particular consideration; the one having quite as real an existence as the other, and both having their reality in the singular object known by sense and consciousness.

He goes on to a very subtle discussion as to our ideas of space and time. He says, that "it is from the disposition of visible and tangible objects we receive the idea of space, and from the succession of ideas and impressions we form the idea of time." The statement requires to be amended. It is not from the disposition of separate objects we have the idea of space, but in the very perception of material objects we know them as extended, that is, occupying space; and in the very remembrance of events we have time in the concrete, that is, events happening in time past. He is therefore wrong in the {138} sceptical conclusion which he draws, that the ideas of space and time are no distinct ideas; for they are ideas formed by a high intellectual process from things immediately known. Taking a defective view of the nature and function of abstraction, he denies that we can form any idea of a vacuum or extension without matter. He maintains that the idea we form of any finite quality is not infinitely divisible. The dispute, he says, should not be about the nature of mathematical points, but about our ideas of them; and that, in the division of our ideas, we come to a minimum, to an indivisible idea. This whole controversy seems to me to arise from a misapprehension. Our idea of space, it is evident, is neither divisible nor indivisible and as to space, it is not divisible either finitely or infinitely for while we can divide matter, that is, have a space between, we cannot separate any portion of space from all other space: space is and must be continuous. He is evidently jealous of the alleged certainty of mathematics, which seemed to be opposed to his universal scepticism. He maintains that the objects of geometry are mere ideas in the mind. I admit that surfaces, lines, points, have no independent existence, but they have all an existence in solid bodies. By an excess of ingenuities and subtleties, he would drive us to the conclusion that space and time are mere ideas, for which we need not seek a corresponding reality; a conclusion unfortunately accepted by Kant, who thus opened the way to the empty idealism which so long reigned in the German philosophy.[38] {139}

The result reached is summed up in the statement: "As long as we confine our speculations to the <appearances> of objects to our senses, without entering into disquisitions concerning their real nature and operations, we are safe from all difficulties, and can never be embarrassed by any question; " but, " if we carry our inquiry beyond the appearances of objects to the senses, I am afraid that most of our conclusions will be full of scepticism and uncertainty." The intelligent reader will here perceive the source whence Kant derived his doctrine that the senses give us, not things, but <phenomena>, that is appearances, and that we are involved in contradiction when we suppose that they furnish more. However great the logical power of the German metaphysician, it is clear that he did not possess the shrewdness of the common-sense philosopher of Scotland, when he adopted the conclusion of the sceptic as his starting-point.

He has now to face the important subjects of existence and knowledge. Proceeding on his assumption that nothing is present to the mind but perceptions, he argues, I think

logically (if the premises be allowed), that we can never advance a step beyond ourselves, and that it is " impossible for us so much as to conceive or form an idea of any thing specifically different from ideas or impressions." As knowledge had been represented by Locke as consisting in comparison (I reckon this a false and dangerous doctrine), Hume has to consider the relations which the mind of man can discover.

These he represents as being seven: those of resemblance, identity, space and time, quantity, degree, contrariety, cause and effect. This is a very good enumeration of the relations perceivable by man: it is certainly very much superior to that of many later metaphysicians, British and Continental. " These relations may be divided into two classes, into such as depend entirely on the ideas which we compare together, and such as may be changed without any change in the ideas." In the first class he places resemblance, contrariety, degree, proportion. These depend solely on our ideas. These only can be the objects of knowledge and certainty, but they can never go beyond our ideas, which can never go beyond our impressions. The other four do not depend on our ideas, and might seem to carry us beyond them; but this he shows {140} is an illusion. In identity, and time and space, we can never ,,go beyond what is immediately present to the senses," and thus can never discover the real existence or the relations of objects. And so "`tis only causation which produces such a connection as to give us assurance, from the existence or action of one object, that 'twas followed or preceded by any other existence or action." He devotes the whole energy of his intellect to the task of showing that we know nothing of the nature of the relation between cause and effect; that we know their conjunction within our experience, but not their connection.

In discussing this question, and kindred ones, he finds it necessary to explain the nature of belief. " The belief of the existence of an object joins no new ideas to those which compose the idea of the object." What then is the difference between belief and incredulity? It consists solely in the liveliness of the former. " We must not be contented with saying that the vividness of the idea produces the belief, we must maintain that they are individually the same." " The belief or assent which always attends the memory and senses is nothing but the vivacity of those perceptions they represent, and this alone distinguishes them from imagination." The theory is surely palpably false here, for our imaginations, in which there is no faith, are often livelier than our memories, in which there is belief. But, by this theory, he would account for all our beliefs. He would establish it as a general maxim in the science of human nature, that when any impression becomes present to us, it not only transports the mind to such ideas as are related to it, but likewise communicates to them a share of its force and vivacity. " A present impression being vivid, conveys its vividness to all the ideas which are associated with it by such general laws as those of resemblance, contiguity, and causation." " A person that has lost a leg or an arm by amputation, endeavors, for a long time afterwards, to serve himself with them. After

the death of any one, 'tis a common remark of the whole family, but especially the servants, that they can scarce believe him to be dead, but still imagine him to be in his chamber, or in any other place where they were accustomed to find him." The explanation may seem a very ingenious, but it is a very feeble one. We may {141} believe that we saw a particular person yesterday, though we have no lively impression or idea retarding him; and we do not believe in the existence of Achilles, though the reading of Homer has given us a vivid conception of him.[39]

But this theory is employed to give an explanation of our {142} belief in the relation of cause and effect. The one having always been with the other in our experience, we are led by habit, and proceeding on the principle of association, when we find the one to look for the other, and thus, too, the effect being present, that is an impression, gives its vividness to the cause as an associating idea. "The idea of cause and effect is derived from experience, which, presenting us with certain objects constantly conjoined with each other, produces such a habit of surveying them in that relation, that we cannot, with out a sensible violence, survey them in any other." This is his explanation of what is implied in efficacy, agency, power, force, energy, connection, productive quality. The essence of necessity is " the propensity which custom produces to pass from an object to the idea of its usual attendant." " When any object is presented to it, it immediately conveys to the mind a lively idea of that object which is usually found to attend it, and this determination forms the necessary connection of these objects." His definition of cause is "an object precedent and contiguous to another, and so united with it that the idea of the one determines the mind to form the idea of the other, and the impression of the one to form a more lively idea of the other."

Hume's doctrine is founded on his favorite principle, " that all our ideas are copied from our impressions but the necessary connection of cause and effect cannot be in the impression, for " when I cast my eye on the known qualities of objects, I immediately discover that the relation of cause and effect depends not the least on them." Not being in the impression, it cannot be found in the idea. Now it is here, I apprehend, that Hume is to be met. I have disputed his theory that the mind begins with mere impressions; it commences with the perception or knowledge of objects within itself, and without itself. Now, in its primitive perception of objects, it knows them as having power; it knows self as a power, and it knows the not-self as a power, -- as a power in resisting and impressing the self. Here is the <impression>, if any one will call it so (I call it knowledge), that gives rise to the idea which may be separated in thought by abstraction, and put in the form of-- a maxim by generalization.

Unfortunately, as I think, the opponents of Hume have {143} not always met him at the proper point. They have allowed him that we have no original knowledge of power in the objects, and having given this entrance to the sceptic, they find great difficulty in resisting his farther ravages. Sometimes they have endeavored to discover a <nexus> of some

kind <between> the cause and its effect, but have always failed to tell what the bond is. Causation is not to be regarded as a <connection between> cause and effect, but a power in the object, that is, substance (or objects and substances), acting as the cause to produce the effect. Kant labored to oppose the scepticism of the Scotchman by supposing that the mind, by its own forms, bound together events in its contemplation of them. But when he allowed that the power was not in the objects, he introduced a more subtle and perilous scepticism than that which he sought to overthrow. We avoid this subjective idealism by insisting that it is on the bare contemplation of a thing becoming, and not by the mere association of ideas and custom (which may aid), that we declare that it must have had a cause.

He is now prepared to discuss two questions: "Why we attribute a continued existence to objects even when they are not present to the senses, and why we suppose them to have an existence distinct from the mind and perception?" He shows, as to the first, the senses give us nothing but a present perception; and, as to the second, that our perceptions being of ourselves, can never give us the least intimation of any thing beyond. He dwells in the usual manner on the acknowledged unreality of what have been called the secondary qualities of matter, and as we naturally look upon the primary qualities, such as motion and solidity, and the secondary qualities, such as colors, sound, heat and cold, as alike real, so we must philosophically consider them as alike unreal. After the manner of the times, he rejects the notion that we can immediately perceive our bodily frame, and not mere impressions, and that we can know both the" objects and ourselves." But whence, it is asked, the coherence and constancy of certain impressions? He accounts for it on the principle that the thought, according to the laws of association, slides from one impression to others with which it has been joined, and reckons them the same, and mistakes the succession of images for an identity of objects. {144}

The result reached by him is," All our distinct perceptions are distinct existences," and ,the mind never perceives any real connection among distinct existences." "What we call mind is nothing but a heap or collection of different impressions united together by certain relations, and supposed, though falsely, to be endowed with a perfect simplicity and identity." He gives the same account of what we call matter. He shows that having nothing but impressions, we can never, on the mere ground of a conjunction which we have never witnessed, argue from our perceptions to the existence of external continued objects; and he proves (very conclusively, I think, on his assumption), that we could never have any reason to infer that the supposed objects resemble our sensations.[40] He now draws his sceptical conclusion: " There is a direct and total opposition betwixt our reason and our senses, or, more properly speaking, betwixt those conclusions which we form from cause and effect, and those that persuade us of the continued and independent existence of body. When we reason from cause and effect, we conclude that neither color, sound, taste, nor smell have a continued and independent existence. When we exclude these sensible qualities, there

remains nothing in the universe which has such an existence."

The question is: How is such a scepticism to be met? Reid opposed it by showing that the sensation leads us intuitively to believe in the existence of the external thing, and that the states of self, known by consciousness, imply a thinking substance. {145} The more correct statement seems to me to be, that we know at once the external objects; that intuitively we know our own frame and objects affecting it; that we are conscious, not of states arguing a self, but of self in a certain state; and that, on comparing a former self recalled by memory and a present self known by consciousness, we declare them to be the same. Kant certainly did not meet the scepticism of Hume in a wise or in an effective manner, when he supposed that the unity was given to the scattered phenomena by forms in the mind.

It is clear that all the usual psychological arguments for the immateriality and immortality of the soul are cut up and destroyed by this theory. We cannot speak of the soul as either material or spiritual, for we know nothing either of matter or spirit except as momentary impressions. The identity which we ascribe to the mind of man is only a fictitious one." Identity is nothing really belonging to these different perceptions, but is merely a quality which we attribute to them because of the union of their ideas in the imagination, when we reflect upon them.

His theory of causation undermines the argument for the divine existence. He carefully abstains from dwelling on this in his great philosophic work, but he expounds it at great length, and with all his intellectual power, in his " Dialogues on Natural Religion." We know nothing of cause, except that it has been observed to be the antecedent of its effect; when we have noticed an occurrence usually preceded by another occurrence, we may on discovering the one look for the other. But when we have never seen the events together, we have really nothing to guide us in arguing from the one to the other. We can argue that a watch implies a watchmaker, for we have observed them together; but never having had any experience of the making of a world, we cannot argue that the existence of a world implies the existence of a world maker. There is no effective way of answering this objection, but by maintaining that an effect necessarily implies a cause. It was on this ground that he was met by Reid, who argues that traces of design in God's works argue an intelligent cause. Kant deprived himself of the right to argue in this way, by making the mind itself impose the relation of causation on events, {146} so that we cannot argue that there is a corresponding law in the things themselves. Hume urges with great force and ingenuity, as Kant did after him, that if we are compelled to seek for a cause of every object, we must also seek for a cause of the Divine Being. This is to be met by showing that our intuitive conviction simply requires us to seek for a cause of a new occurrence. He argues, as Kant also did after him, that the existence of order in the universe could at best prove merely a finite and not an infinite cause. The reply is, that we must seek for the evidence of the infinity of God in the peculiar conviction of the mind in regard to the

infinite and the perfect.[41]

This may be the most expedient place for stating and examining his famous argument against miracles, as advanced in his essay on the subject. It is clear that he could not argue, as some have done, that a miracle is an impossibility, or that it is contrary to the nature of things. He assails not the possibility of the occurrence of a miraculous event, but the proof of it. Experience being with him the only criterion of truth, it is to experience he appeals. He maintains that there has been an invariable experience in favor of the uniformity of nature, and that a miracle being a violation of a law of nature, can never be established by as strong proof as what can be urged against it. He then exerts his ingenuity in disparaging the evidence usually urged in behalf of miraculous occurrences, by showing how apt mankind are to be swayed on these subjects by such principles as fear, wonder, and fancy. We are not {147} sure whether Hume has always been opposed in a wise or judicious manner by his opponents on this subject. It is of little use showing that there is some sort of original instinct leading us to believe in testimony; for this instinct, if it exists, often leads us astray, and we must still go to experience to indicate what we are to trust in and what we are to discard. But the opponents of Hume were perfectly right when they showed, that in maintaining that nature always acted according to certain mundane laws, he was assuming the point in dispute. Let us admit that the whole question is to be decided by experiential evidence. Let us concede that in the present advanced state of science there is ample evidence that there is a uniformity in nature; but then let us place alongside of this a counterpart fact, that there is a sufficient body of evidence in favor of there being a supernatural system. For this purpose let the cumulative proofs in behalf of Christianity, external and internal, be adduced; those derived from testimony and from prophecy, and those drawn from the unity of design in the revelation of doctrine and morality, and from the character of Jesus; and we shall find that in their consistency and congruity they are not unlike those which can be advanced in behalf of the existence of a natural system.

In Book Second of his Treatise, Hume treats of the passions. It is the most uninteresting part of his writings. The reading of it is like travelling over an immense plain, which looks inviting at the distance, but in which we find no spots of fertility or of historical interest. It looks as if the good-humored but phlegmatic man were incapable of discussing the nature of the passions. The composition, though clear and sustained, is never elevated by bursts of feeling or irradiated by gleams of genius. He has a theory to support, and he defends it by wiredrawn ingenuity. When he treats of the understanding, if be does not establish much truth, he at least overthrows venerable error, and we are constrained to admire his intellectual energy and courage; but, in dealing with the feelings of our nature, he wastes his strength in rearing a baseless fabric, which, so far as I know, no one has ever adopted, and no one has been at the trouble to assail. He has no proper analysis of man's original springs of action. He says only in a general way,

that "the chief spring or actuating {148} principle of the human mind is pleasure and pain." He gives no psychological account of the place which the idea or apprehension of an object as good or evil, or rather as appetible or inappetible, has in all feeling. Of course, all passions are according to him impressions, only he calls them reflective impressions, to distinguish them from sensations. The reflective impressions are of two kinds, the calm and the violent; the first including beauty and deformity, and the latter such passions as love and hatred, grief and joy, pride and humility. He connects his theory of the passions throughout with his theory of the understanding. There are associations among the passions, as there are associations among ideas; only he says, that while ideas are associated by resemblance, contiguity, and causation, impressions are associated only by resemblance. There has as yet been no thorough examination, so it appears to me, of the laws of succession of feeling, as distinguished from that of ideas; I am not convinced that the theory of Hume, that feelings are associated only by resemblance, is the correct one. He draws a distinction between the cause and the object of passion. Thus if a man has made a beautiful house, the object of the passion is himself, and the cause is the beautiful house. The idea of ourselves is always present with, and conveys a' sensible degree of vivacity to the idea of any other object to which we are related; in short, turns the idea into an impression. Some other person is the object of love, but the cause of that passion is the relation of that person to self. Out of this may proceed the desire of happiness or misery of others, which he describes "<as an arbitrary and original instinct implanted in our nature>," -- I put the language in italics, as I may have occasion again to refer to it. In this way he constructs an elaborate, but by no means clear, theory of the passions. He divides them into direct and indirect. By direct, he understands such as arise immediately from good or evil, that is, from pain or pleasure. He says of them: " The direct passions frequently arise from a natural <impulse or instinct, which is perfectly unaccountable>. Of this kind is the desire of punishment to our enemies and of happiness to our friends, hunger, lust, and a few other bodily appetites." Under the direct, he includes desire, aversion, grief, joy, hope, fear, despair, and security. The indirect proceed {149} from the same principles, but by conjunction with other qualities; and he comprehends under them pride, humility, ambition, vanity, love, hatred, envy, pity, malice, generosity, with their dependents. It may be said of his exposition of the passions generally, that he has often seized on important circumstances which modify their action, but has altogether failed in his explanation of their nature. Thus he has some just remarks upon the transition of one idea to another, upon the effects thus produced, and upon the predominant passion swallowing up the inferior; but after all we have no proper evolution of the psychological process.

He occasionally refers to beauty, but the account he gives of it is very inadequate. "Beauty is such an order and construction of parts, as either by the primary constitution of our nature, or by custom, or by caprice, is fitted to give a pleasure and satisfaction to our souls." "The

conveniency of a house, the fertility of a field, the strength of a horse, the capacity, security, and swift-sailing of a vessel, form the principal beauty of these several objects." It is clear that the aesthetic tastes of one satisfied with such a theory could not have been keen, and we do not wonder to find that in the letters written during his travels, he never makes a single allusion to a fine statue or painting.

The account which he gives of the will is still more defective. "The will is the internal impression we feel and are conscious of, when we knowingly give rise to any new motion of our body." Surely we may have will in regard to our mental operations as well as in regard to our bodily motions. The will, he says, is an impression, but surely it is an impression of a very peculiar kind; and he should have inquired, which he has not done, into its nature, when he would have seen that it possesses an essential freedom. As not perceiving this, he has left nothing to save man from being driven on by an iron necessity.

In Book Third, he treats of morals, and starts his utilitarian theory, which, however, he develops more fully, and in a livelier, more pointed, and ornate manner, in his essay, ,An Inquiry concerning the Principles of Morals." He says of this work, that it is " of all my writings, historical, philosophical, or literary, incomparably the best." In respect of practical influence, {150} it has certainly been the most important. By his speculative doubts in regard to the operations of the under standing he has furnished a gymnastic to metaphysicians ever since his time; but by his theory of virtue he has swayed belief and practice.

He shows that we cannot distinguish between good and evil by reason alone, defining reason as the discovery of truth or false hood, and truth and falsehood as consisting in the agreement or disagreement, either to the real relation of ideas, or to real existence and matter of fact. Taking reason in this sense, it certainly cannot be said to discern the morally good. But then it may be maintained that the mind has a power of discerning moral good and evil analogous to the reason which distinguishes truth and falsehood, and all that he could urge in opposition would be, that such a view is inconsistent with his theory of impressions and ideas. It is by no means clear what is the faculty or feeling to which he allots the function of perceiving and approving the morally good. Sometimes he seems to make man a selfish being, swayed only by motives of pleasure or pain; and in this view virtue is to be regarded as good, because associated directly or indirectly with the pleasure it would bring to ourselves. But in other places he calls in a " benevolent sentiment, leading us to approve what is useful." Hume's general theory might certainly seem op posed to every thing <innate>, and yet, in criticising Locke, he is obliged to say: " I should desire to know what can be meant by asserting that self-love or resentment of injuries, or passion between the sexes, is not innate." We have already quoted passages in which he appeals to instincts. He says elsewhere, "The mind, by an <original> instinct, tends to unite itself with the good, and avoid the

evil." At times he seems to adhere to the theory of Shaftesbury and Hutcheson, as to the existence of a moral sense. "The mind of man is so formed by nature, that upon the appearance of certain characters, dispositions, and actions, it immediately feels the sentiment of approbation or blame." He tells us expressly that he is inclined to think it probable that the final sentence in regard to moral excellence "depends on some internal sense or feeling which nature has made universal in the whole species." I believe that we cannot account for the ideas in the mind except by calling in {151} such a faculty or feeling; and it was his business, as an experimental inquirer, to ascertain all that is in this power, and to determine its mode of operation and its laws. But such an investigation would have overthrown his whole theory, metaphysical as well as ethical.

According to Hume, virtue consists in the agreeable and useful. "Vice and virtue may be compared to sounds, colors, heat and cold, which, according to modern philosophy, are not qualities in objects, but perceptions in the mind." " Virtue is distinguished by the pleasure, and vice by the pain, that any action, sentiment, or character gives us by the mere view and contemplation." This theory goes a step farther than that of Hutcheson in the same direction. Hutcheson placed virtue in benevolence, thereby making the intention of the agent necessary to virtue; whereas Hume does not regard it as necessary that it should be voluntary, and requires us to look merely to the act and its tendency. His definition might lead one to think that an easy road or a pleasant carriage should be regarded as virtuous. But he will not admit that because an inanimate object may be useful as well as a man, that therefore it ought also to merit the appellation of virtuous; for he says: ,The sentiments excited by utility are in the two cases very different, and the one is mixed with affection, esteem, approbation, and not the other." This language, more particularly the phrases "esteem" and "approbation," might leave led him to discover that there is a peculiar judgment or sentiment attached to virtuous action not produced by mere utility.

He easily satisfies himself that he can show that benevolence is a virtue because it is so agreeable and useful; but he never faces the real difficulty, which is to account for the sense of obligation which we feel, and the obligation actually lying upon us, to do good to others.[42] He strives to show that justice is commended by us because of its beneficial tendency. justice can have a meaning, he maintains, only in regard to society and arrangements made with others. True, the giving to every one his due, implies beings to whom the due is to be {152} given; but the due arises from the relation in which we stand to these beings. Thus the first man and woman having children, had duties to discharge towards them as soon as they were born, and independent of any promise. He labors to prove that our obligation to keep a promise arises from utility. " Fidelity is no natural virtue, and promises have no force antecedent to human conventions." True, a promise implies a person to whom it is made, but, once made, the obligation is complete.

This leads us at once to the fundamental objections

which may be taken to the utilitarian theory. Whence the obligation lying on us to promote the happiness of others? to give others their due? to keep our promises? From their utility, it is answered. But why are we bound to attend to what is useful? is the question that immediately occurs; why the reproach that follows, and which justifies itself when we have failed to keep our word? These questionings bring us to a justice which guards conventions, to a law which enjoins love.

The practical morality sanctioned by the system, and actually recommended by Hume, excludes all the higher virtues and loftier graces. The adoration of a Supreme Being, and love to him, are represented as superstition. He has no God to sanction the moral law, and no judgment day at which men have to give in an account. Repentance has and can have no place in a system which has no fixed law and no conscience. Humility, of which he treats at great length, is disparaged. The stern virtues of justice, of self-sacrifice, of zeal in a good cause, of faithfulness in denouncing evil, and of courage in stemming the tide of error and corruption, these are often so immediately disagreeable, that their ultimate utility will never be perceived except by those who are swayed by a higher principle. It is certain that they were not valued by Hume, who speaks of them as superstition and bigotry, and characterizes those who practise them as zealots and fanatics. His view of the marriage relation was of a loose and flexible character, and did not profess to discountenance the evil practices of his time. "A man in conjoining himself to a woman is bound to her ac cording to the terms of his engagement: in begetting children, he is bound by all the ties of nature and humanity to provide for their sustenance and education. When he has performed {153} these two parts of duty, no one can reproach him with injustice or injury." Not acknowledging a God bestowing the gift of life, and requiring us to give an account of the use we make of it, and setting no value on courage in difficulties, he argues that a man may take away his life when it is no longer useful.

The state of society which he aimed at producing is thus described: " But what philosophical truths can be more advantageous .to society than those here delivered, which represent virtue in all her genuine and most engaging charms, and make us approach her with ease, familiarity, and affection? The dismal dress falls off with which many divines, and some philosophers, have covered her, and nothing appears but gentleness, humanity, beneficence, affability; nay, even at proper intervals play, frolic, and gayety. She talks not of useless austerities and rigors, suffering and self-denial." People have often speculated as to what Hume would have taught had he been elected professor of moral philosophy in Edinburgh. I believe he would have expounded a utilitarian theory, ending in the recommendation of the pleasant social virtues; speaking always respectfully of the Divine Being, but leaving his existence an unsettled question.

And what, it may be asked, is the conclusion to which he wishes to bring us by his whole philosophy? I am not sure that he has confessed this to himself. Sometimes it looks as

if his sublime aim was to expose the unsatisfactory condition of philosophy, in order to impel thinkers to conduct their researches in a new and more satisfactory manner. " If, in order to answer the doubts started, new principles of philosophy must be laid, are not these doubts themselves very useful? Are they not preferable to blind and ignorant assent? I hope I can answer my own doubts; but, if I could not, is it to be wondered at? " I verily believe that this was one of the alternatives he loved to place before him to justify his scepticism. " I am apt," he says, in writing to Hutcheson, " to suspect in general that most of my reasonings will be more useful in furnishing hints, and exciting people's curiosity, than as containing any principles that will augment the stock of knowledge that must pass to future ages." But I suspect that the settled conviction reached by him was that no certainty could be attained in speculative philosophy; he was sure {154} that it had not been attained in time past. The tone of the introduction to his great work is: " There is nothing which is not the subject of debate, and in which men of learning are not of contrary opinions. If truth be at all within the reach of human capacity, it is certain it must be very deep and abstruse; and to hope we shall arrive at it without pains, while the greatest geniuses have failed with the utmost pains, must certainly be esteemed sufficiently vain and presumptuous." As being thus deep, he feels as if the great body of mankind need not trouble themselves much about it. He seems at times complacently to contemplate this as the issue to which he would drive mankind for he sees at once that if men become convinced that they cannot reach certainty in such speculations, they will give up inquiry. " For nothing is more certain than that despair has almost the same effect upon us as enjoyment, and that we are no sooner acquainted with the impossibility of satisfying any desire than the desire itself vanishes and he thinks it a satisfactory condition of things when men discover the impossibility of making any farther progress, and make a free confession of their ignorance. Considered in this light, Hume's philosophy, in its results, may be considered as an anticipation of the positive school of M. Comte, which in the British section of it approaches much nearer the position of Hume than most people are aware of.

He allows that man should, as indeed he must, follow his natural impulses, and the lessons of experience, as far as this world is concerned. But he will grant nothing more. He thus closes his inquiry into the understanding: "When we trace up the human understanding to its first principles, we find it to lead us into such sentiments as seem to turn into ridicule all our past pains and industry, and to discourage us from future inquiries." "The understanding, when it acts alone, and according to its general principles, entirely subverts itself, and leaves not the lowest degree of confidence in any proposition, either in philosophy or common life." In common life this scepticism meets with insuperable barriers, which we should not try to overcome. But it is different with philosophical, and, we may add, theological truths, which are supported solely by speculative considerations. In these departments {155} we may discuss and doubt as we please, without doing any injury. " What injury can ever come from ingenious reasoning

and inquiry? The worst speculative sceptic I ever knew was a much better man than the best superstitious devotee." Those who think they can reach truth in these matters are at liberty to cherish their conviction, provided always that they do not thereby disturb their neighbors. But the time is coming, and already wise men see that it is coming, when mankind will not concern themselves with such speculative questions, or will engage in them only as a gymnastic to the intellect, or as a means of showing that ultimate truth is unattainable by man.

It was, I believe, on such grounds as these that Hume justified himself in his sceptical doubts, and his sceptical solution of these doubts. He thought they might stir up inquiry on subjects on which no truth had been reached; and tend to confound the dogmatism and restrain the disputations in philosophy, and the fanaticism and superstition in religion, which had wrought such mischief; and prepare the way for a reign of universal toleration. As to religious belief, it could be supported only by speculative arguments, derived from an absolute causation, or from miracles which cannot stand a searching investigation. So far as men follow a moderate and tolerant religion, Hume was rather pleased with them, and he evidently shrank from the fanatical atheism avowed by some of the more advanced followers of the system in France. If there be a world to come, it will clear up itself when it comes; and, meanwhile, there are duties which we must perform, from a regard to ourselves and our relation to others. There had hitherto been no science of metaphysics; but there could be a science of ethics (and also of politics) founded on the circumstance, that certain acts are found to be agreeable and useful to ourselves and others.

It is in this way we are to reconcile certain seeming inconsistencies in his character. He had no settled faith in any religion, yet he went to church, at least at times; he wished his servant to go to church, and he mingled in the counsels of the Church of Scotland. He never committed himself to deism or atheism. He wrapped up his thoughts on these subjects in his bosom, perhaps with some feeble hope that he {156} might get light; but the cloud seems only to have settled more deeply upon him. When the pert Mrs. Mallet met him one night at an assembly, and boldly accosted him, " Mr. Hume, give me leave to introduce myself to you: we deists ought to know each other," " Madam," replied he, " I am no deist: I do not style myself so, neither do I desire to be known by that appellation." He did not avow himself an atheist in Paris. Sir Samuel Romilly has detailed a characteristic anecdote told of him by Diderot. He dined with a large company at the house of Baron D'Holbach. "As for atheists," said Hume, " I do not believe one exists: I have never seen one." " You have been a little unfortunate," said the baron: " here you are with seventeen of them at the table for the first time." We may suppose there was some sincerity in the statement he made: " I have surely endeavored to refute the sceptic with all the force of which I am master, and my refutation must be allowed to be sincere because drawn from the capital principles of my system," only he was not prepared to review his system. In writing to Elliott, he says he wishes to make Cleanthes, the theist,

the hero of the dialogue. Adam Ferguson told his son, who reports the incident, that one clear and beautiful night, when they were walking home together, Hume suddenly stopped, looked up to the starry sky, and said, " O Adam, can any one contemplate the wonders of that firmament, and not believe there is a God! " Dr. Carlyle tells us, that when his mother died he was found in deepest affliction and a flood of tears, upon which Mr. Boyle said to him that his uncommon grief arose from his having thrown off the principles of religion; to which he replied: " Though I throw out my speculations to entertain the learned and metaphysical world, yet in other things I do not think so differently from the rest of the world as you imagine." In whatever way we may account for it, there was evidently a consistency in the character of Hume which made him respected by his worldly friends, who thought a man might be good, though he had no godliness.

The all-important question is, How is this spirit to be corrected, this error to be met?

<First>. It must be firmly maintained that an honest mind can spontaneously attain such truth, secular, moral, and religious, {157} as is needful to its peace and progress. This truth does not lie deep down in some pit, which can be reached only by deep down, or whence it can be drawn only by the cords of lengthened ratiocination; it lies on the surface, and may be seen by immediate perception, or picked up by brief discursive processes. By this spontaneous exercise of our faculties and common observation, we reach the existence of God, the accountability of man, and a day of judgment. By such an easy method we rise to a belief in the Word of God, and in the spiritual verities there set forth. We should hold that man reaches all this by as natural a procedure as that by which he comes to know what path he should take in the common affairs of this life. No doubt be will at times meet with difficulties, but this only as he may be beset by perplexities in the affairs of this world; and in the one case, as in the other, the sincere mind has commonly enough of light to guide it.

Secondly. It should be held that he who undermines the fundamental truth spontaneously discovered, is doing an injury to humanity. Scepticism, as Hume delights to show, can produce no mischief in the common secular affairs of life, because there are circumstances which keep men right in spite of their principles, or want of principles. But it is very different in respect of those questions which fall to be discussed in higher ethics and theology. A man will not be tempted by any sophistry to doubt the connection of cause and effect when he is thirsty and sees a cup of water before him; in such a case he will put forth his hand and take it, knowing that the beverage will refresh him. But he may be led by a wretched sophistry to deny the necessary relation of cause and effect when it would lead him upward from God's works to God himself, or induce him to seek peace in Him. Hence the importance of not allowing fundamental truth to be assailed; not because the attack will have any influence on the practical affairs of this life, but because it may hold back and damp our higher aspirations, moral and religious. Hume hoped that his scepticism might soften

asperities, but he did not wish to think that any bad influences could follow from it. On one occasion he was told of a banker's clerk in Edinburgh, of good reputation, who had eloped with a sum of money; and the philosopher wondered greatly what could {158} induce such a man thus to incur, for an inconsiderable sum, such an amount of guilt and infamy. "I can easily account for it," said John Home, "from the nature of his studies, and the kind of books he was in the habit of reading." "What were they," said the philosopher. He was greatly annoyed when told, Boston's "Fourfold State," and Hume's "Essays." Certainly the youth must have been in a perplexed state who had been converted from a belief in the " Fourfold State" by Hume's " Essays," or who was hesitating between them. Thirdly. The philosopher must undertake a more important work. He must inquire into the nature of fundamental truth; he must endeavor to unfold the mental powers that discover it, and to expound their mode of operation, and their laws. He cannot indeed prove first truths by mediate evidence, for if they were capable of probation they could not be first truths; but he can show that they are first truths perceived by immediate cognition of the objects, and in no need of external support. He must as far as possible clear tip the difficulties and perplexities in which the discussions in regard to them have become involved. In particular, he must show that while the reflex consideration of the ultimate principles of knowledge often lands us in difficulties, the principles them selves never lead us into positive contradictions; and that, therefore, while we allow that the human faculties are limited, we cannot admit that they are deceptive. This is what has been attempted by one philosopher after another since the days of Hume.

In fact, all later philosophy springs directly or indirectly from the thorough-going examination to which the Scotch sceptic had subjected received truths. It has been the aim of the Scottish school, as modified and developed by Reid, to throw back the scepticism of Hume. Reid tells us that he once believed the received doctrine of ideas so firmly as to embrace the whole of Berkeley's system along with it, till, on discovering the consequences to which it had been driven by Hume, he was led to review the whole theory and abandon it. Kant declares that he was roused from his dogmatic slumbers by the assaults of the Scottish sceptic, and was thus impelled to the task of repelling the attack. It is scarcely necessary to say that all other philosophies, deserving the name, which have {159} originated within the last hundred years, have ramified directly or indirectly from the Scottish and the German schools; one school, the French school of M. Cousin, seeking to combine the two.

It is interesting to observe the respective ways in which the Scottish and the German metaphysician sought to meet the great sceptic. It is evident that his assaults might be repelled at one or other of two places: either where the foe has entered, or after he has made certain advances. That the mind begins with impressions and goes on to ideas, which are mere reproductions of impressions,-this is the fundamental principle of Hume. Now this may be denied, I think should be denied. On what ground, we ask,

does he allow the existence of impressions and ideas? When he answers, we can show him that on the same ground he must admit more; that he must allow that the mind has convictions in regard to its own existence, and the existence of external objects, and perceptions of moral goodness. But again, he may be met at the farther stages of his progress. He asserts that the mind can reach no truth except such as it gets from experience. It may be shown in opposition that it has an original furniture in the shape of tendencies and laws which lead to and guarantee necessary and eternal truth. It is interesting to observe that Reid met him at both these points. Reid made a very careful inquiry into the nature of the senses as inlets of knowledge; and showed that accompanying the sensation there is always an intuitive perception of an external world. He showed too, though he did not make so much of it as he might, that consciousness is a mental faculty and a source of knowledge. He farther met the sceptic at the more advanced point, and proved that the mind has a primitive reason or common-sense which decides at once that things are so and so; that every effect, for instance, must have a cause. I am not of opinion that Reid has thoroughly cleared up these subjects, that he has detected all that is in the senses, that he has unfolded fully the laws of intuition and its mode of operation; but he has established enough to repel the assaults of the sceptic.

Reid possessed many of the best qualities of his countrymen; in particular, he was shrewd and independent: but he was not {160} endowed with great powers of logical analysis. On the other hand, Kant was strong where Reid was weak; that is, in power of dissection and construction: but was deficient where Reid excelled, in patient observation. He neglected, as I think most unfortunately, to oppose the fundamental principle of Hume. He allows that the mind begins with <phenomena> in the sense of appearances, and these phenomena are just the <impressions> of Hume. But if it be allowed that in the original inlet we have only impressions or phenomena, it never can be satisfactorily shown how we can reach reality by any composition or decomposition of these. Kant exercised his vast powers in meeting Hume at the other point; that is, in showing that there is an priori furniture in the mind, independent of all experience. But what he built with the one hand he took down with the other. For these <a priori> forms could not, in his theory, guarantee any objective reality. He accepts the conclusion of Hume, and allows that the speculative reason could not guide to truth; he goes so far as to maintain that it lands us in contradictions. This philosophy, intended to overthrow the scepticism of Hume, has thus led to a scepticism which has had a more extensive sway than that of the cold Scotchman ever had. He endeavored to save himself from such an issue by calling in a practical reason, which guaranteed as its corollaries the freedom and immortality of the soul, and the Divine existence. But it was immediately asked how it could be shown that the practical reason does not deceive, after it has been conceded that the speculative reason leads to illusion? Thus the insecure mound, raised with such labor to stem the flood, only aggravated the outburst and overflow as it gave way.

Sir W. Hamilton sought to unite Reid and Kant, but was never able to weld thoroughly together the principles which he took from two such different sources. His doctrines of the relativity of knowledge, and of causation as a mere impotency of the mind, have prepared the way for a doctrine of nescience now largely espoused. Some of his pupils have betaken themselves to a sort of confused Berkeleyanism mingled with Kantism, which will furnish an easy passage to the nescient theory in so shrewd a nation as Scotland, and among so practical a people as the English. Mr. Mill, in his examination {161} of Hamilton's Philosophy, has brought us to a <Humism> joined to Comtism. This is the dismal creed provided for those who choose to follow the negative criticisms. of the day in philosophy and theology. What we need in these circumstances is a new Thomas Reid, not to do over again the work which the common-sense philosopher did, but a corresponding service in this age to what he did in his time.

XX.-BOOKS ADVERTISED IN " SCOT'S MAGAZINE."

T/HE\ "S/COT'S\ M/AGAZINE\" begins in 1739. The works mentioned and the topics discussed will give us a better idea of the times, than any thing else that can be produced. In January is advertised " A Treatise of Human Nature," the work that revolutionized all modern philosophy. For years, we have papers about Whitefield, who revolutionized religion in England, and had a mighty influence in Scotland and America. The magazine has a series of papers, lasting for years, under the head of " Common Sense." In March, there is an advertisement of a " Second Volume of Common Sense Letters collected," showing that we have no need to go to remote quarters to find the source from which Reid and the Aberdeen school got the phrase, "common sense," which had been in constant use since the time of Shaftesbury (P. 31). It is curious to notice that, in January, comedians are prosecuted before the Court of Session, and, in February, are found guilty, and "decerned for the penalties in the late Act against strollers." In March, there is an advertisement, " A View of the Necessitarian or Best Scheme, freed from the Objections of M. Crouzaz in his Examinations of Pope's I Essay on Man."' In June, "The Necessity of Revelation," by Archibald Campbell, PP. 45, 3d-- in sheets, showing that revelation needed to be defended. In October, an attack on Campbell's book, and, in December, a reply by Campbell. In October, " A Treatise of Ancient Painting," by Dr. Turnbull, 41. 4s. in sheets. In February, 1740, "The Principles of Moral Philosophy;" in December, "A Methodical System of Universal Law; " and, in May, -- A Curious Collection of fifty Ancient Paintings," 1L. 8s., all by Turnbull, showing that there was a taste in the country for ethical and aesthetic discussions, -- the failure of Turnbull's works proving that it was not to be gratified by the excellent commonplace of that author. In 1740, Simson, whose views in regard to the Trinity raised such discussion, passes away from this world, after having lived in retirement since his suspension in 1728. In May, we have "The Principles and Connection of Natural and Revealed Religion," by A. Ashley Sykes; and "The Divine Authority of the Old and New Testament asserted," by J. Leland, D.D., 25S.; and, in July, " Discourses concerning {162} the Being

and Natural Perfections of God," by J. Abernethy, M. A-, 5s-- 6d-; all showing that there were men ready to defend natural and revealed religion on sound, sensible principles. That deism is alive, appears from May, when " Physico, Theologico, Philosophico, Moral Disquisition concerning Human Nature, Free Agency, Moral Government, and Divine Providence," by T. Morgan, M.D., 5s. 6d., appears. In June, " Remarks on the Inquiry into the Nature of the Human Soul," is. In December, among preferments, Adam Smith, Comptroller of the Customs at Kirkcaldy, Inspector-General of the Customs; showing that a competent man was being prepared to discuss political economy. In April, 1741, " The Temper, Character, and Duty of a Minister of the Gospel," a sermon by William Leechman, M. A., 6d.; indicating the introduction of Moderatism into the Church of Scotland in its most plausible form, denying no orthodox doctrine, and yet recommend, in graceful language, only the truths of natural religion, and the common moralities of life, -- an evidence that the attacks of deistical writers had made many ashamed of the deeper doctrines of Scripture. In January, 1744, there is an abstract of the associate presbytery for renewing the Covenants, dated at Stirling, Dec. 23, 1743, "complaining of several immoralities, and the repealing of the penal statutes against witches. The penal statutes against witches have been repealed by the parliament, contrary to the express law of God: by which a holy God may be provoked in a way of righteous judgment, to leave those who are already ensnared to be hardened more and more, and to permit Satan to tempt and seduce others to the same wicked and dangerous snares." The above list shows clearly an age of great intellectual activity, a strong tendency to philosophical discussion among Scotchmen, a vigorous attack on Christianity, a respectable defence of it and of natural religion, a revival of evangelical religion under Whitefield, and a strong love of it on the part of the common people, along with the appearance of intemperance and strolling players. It was in the midst of this ferment that Hume's work appeared, to shake all that was thought to be established in philosophy and in natural religion.

XXI.-ADAM SMITH.[43]

H/IS\ is perhaps the most illustrious name appearing in these sketches. But he has a higher reputation in political economy than in metaphysics, in which latter department he comes before us as the author of a theory of moral sentiments, and of very interesting fragmentary histories of certain departments of philosophy. {163}

He was born June 5, 1723, in the "lang toun" of Kirkcaldy, which lies on the opposite side of the Frith of Forth from Edinburgh. His father was comptroller of the customs there and his mother, a benignant Christian lady, watched over his sickly childhood with tenderness, which he repaid her by a corresponding kindness for the long period of sixty years, for the greater part of which the two lived together. When about three years old he was stolen by a party of tinkers, who took him to the woods, but was fortunately rescued. We should have liked to hear him, in his later years, speculating as to what might have been his place in the gypsy camp had he been brought up among them.

We can conceive that, while fashioning spoons out of horns and mending tin dishes, his comprehensive head would have been spinning a theory of the organization of the tribe. But it would have been beyond the capacity even of the explorer of the nature and causes of national wealth to determine what he himself or any other might have become if trained in such different circumstances. He seems to have received an excellent education in his native place, at a school which reared a number of eminent men. Unable from his weak bodily constitution to join in active amusements, he gave himself to reading, and, even at that early age, was noted for speaking to himself when alone, and falling into absent fits in company. At the premature age of fourteen, he went to the University of Glasgow, where his favorite studies seem to have been mathematics and natural philosophy. But before he left he attended the lectures of Hutcheson, whom he greatly admired, and who, no doubt, helped to direct him to philosophic pursuits. From Glasgow he went, on a salary provided by the Snell Foundation, to Baliol College, Oxford, where he resided for seven years, and seems to have given himself specially to the studies of polite literature. " He employed himself frequently in the practice of translation (particularly from the French), with a view to the improvement of his own style." Every one knows that the French authors were the models to which the greater part of the Scottish writers looked at that time. Hume and Smith entertained a feeling of admiration for French prose and poetry, but had no appreciation (as Adam Ferguson remarked) of Shakespeare or Milton. {164}

His original destination had been to the Church of England, but he did not find the profession to suit him. When at Oxford, the heads of the college found him reading Hume's Treatise of Human Nature," and they seized the work, and reprimanded the youth. ("Life," by M'Culloch.) On leaving Oxford he spent two years at Kirkcaldy, uncertain as to what he might do. In 1748 he removed to Edinburgh, where he delivered lectures on rhetoric and belles-lettres; the commencement, I believe, of that instruction in polite literature and English composition which has ever since been a distinguishing feature of the collegiate education in Scotland. In 1748 he was elected professor of logic, and in 1752 professor of moral philosophy, in the University of Glasgow. In the former, after an exposition, apparently brief (as we might expect from the spirit of the times), of the ancient logic, he devoted the rest of his time to rhetoric and belles-lettres. In the latter he divided his course into four parts: (1) Natural theology; (2) Ethics, unfolding the views he afterwards published in his " Theory of Moral Sentiments; " (3) Justice, that part of morality which can be expressed in precise rules; (4) Political science in which he delivered the thoughts and observations which were afterwards embodied in his great work, " The Wealth of Nations." In the later years of his Glasgow life, he expanded this last part more and more. An eminent pupil, Dr. Millar, afterwards professor of law in the university, describes him as a lecturer. " In delivering his lectures, he trusted almost entirely to extemporary elocution. His manner, though not graceful, was plain and unaffected; and, as he seemed to be always interested in the subject, he never failed to interest his hearers. Each discourse

consisted commonly of several distinct propositions, which he successively endeavored to prove and illustrate. These propositions, when announced in general terms, had, from their extent, not unfrequently something of the air of a paradox. In his attempts to explain them, he often appeared at first not to be sufficiently possessed of the subject, and spoke with some hesitation. As he advanced, however, the matter seemed to crowd upon him: his manner became warm and animated, and his expression easy and fluent. In points susceptible of controversy, you could easily discover that he secretly conceived an opposition to his opinions, and that he {165} was led upon this account to support them with greater energy and vehemence. By the fulness and variety of his illustrations, the subject gradually swelled in his hands, and acquired a dimension which, without a tedious repetition of the same views, was calculated to seize the attention of his audience, and to afford them pleasure, as well as instruction, in following the same object through all the diversity of shades and aspects in which it was presented, and afterwards in tracing it backwards to that original proposition or general truth from which this beautiful train of speculation had proceeded."

The thirteen years he spent in this office, he looked back upon as the happiest in his life. He published, in 1759, his " Theory of Moral Sentiments," to which was appended an article on Johnson's Dictionary for the then " Edinburgh Review." While in Glasgow he collected a large body of the observations and facts which he afterwards embodied in his immortal work. He was stimulated and aided in these studies by his attending a weekly club founded by Provost Cochran, a Glasgow merchant, who furnished him with much valuable information on mercantile subjects.

In 1763 he gave up his chair in Glasgow, and, at the invitation of Mr. Charles Townsend, became travelling tutor to the young Duke of Buccleuch. One wonders, in these times, at so intellectual a man abandoning the influential position he held in Glasgow to become the teacher of a single youth, however eminent in station. But it was undoubtedly a great advantage to Smith that he was thus enabled to see more of mankind and of the world, and was brought into immediate contact with eminent men of kindred tastes and pursuits in France. Proceeding to France in the spring of 1764, he and his pupil spent eighteen months at Toulouse, and lived on terms of intimacy with some of the principal members of their parliament, and is supposed to have gathered there further materials for his great projected work. On leaving this place, he took an extensive tour in the south of France; spent two months at Geneva; and then went to Paris, and, having recommendations from Hume, he enjoyed the society of such men as Turgot, Quesnay, Morellet, Necker, D'Alembert, Heivetius, Marmontel, and Madame Riccoboni. He is supposed to have derived special benefit from his intercourse with Turgot and Quesnay, {166} who were engaged in political studies similar to his own. In October, to Great Britain, and spent the 1766, he returned next ten years with the mother whom he so much loved, in Kirkcaldy. There are traditions of David Hume visiting him there from time to time, and of their holding earnest conversations on questions of political economy, and, it is supposed, of

religion, as they walked on the sands of the Frith of Forth. From this retreat issued, in 1776, his " Inquiry into the Nature and Causes of the Wealth of Nations," -- the work which made political economy a science.

In 1778 he was appointed, at the request of the Duke of Buccleuch, one of the commissioners of his majesty's customs in Scotland, and removed to Edinburgh, taking his mother with him: it is scarcely necessary to mention that he continued all his life a bachelor. Here he spent the last twelve years of his life. Henceforth he became an object of curiosity to all people of literary culture; and his person was scrutinized, as he walked the streets, by the curious, and his peculiar habits reported. Many a youth, studying in Edinburgh, was proud to relate in after years that he had seen him, -- a fine gentleman of the old school, a little above the ordinary size, with a manly countenance lighted by large gray eyes, wearing a cap, a long, wide great-coat, breeches, and shoebuckles; and they remarked that, when "he walked, his head had a gentle motion from side to side, and his body, at every step, a rolling or vermicular motion, as if he meant to alter his direction, or even turn back. In the street, or elsewhere, he always carried his cane on his shoulder, as a soldier does his musket." ("Lives," by Smellie.) Dr. Carlyle gives a graphic picture of his manner in company. " Adam Smith was far superior to Hume in conversational talents. In that of public speaking they were equal. David never tried it; and I never heard Adam but once, which was at the first meeting of the Select Society, when he opened up the design of the meeting. His voice was harsh, and enunciation thick, approaching to stammering. His conversation was not colloquial, but like lecturing, in which, I have been told, he was not deficient, especially when he grew warm. He was the most absent man in company that I ever saw; moving his lips, and talking with himself, and smiling, in the midst of large companies. If you awaked him from his reverie {167} and made him attend to the subject of conversation, he immediately began to harangue, and never stopped till he told you all he knew about it, with the utmost philosophical ingenuity. He knew nothing of characters, and yet was ready to draw them on the slightest invitation. But when you checked him, or doubted, he retracted with the utmost ease, and contradicted all he had been saying." Carlyle tells us that " David Hume, like Smith, had no discernment at all of character."

Dugald Stewart mentions it as an interesting circumstance that all Hume's works were written with his own hands, whereas Smith dictated to a secretary as he walked up and down his apartment, and hints that we may perceive, in the different styles of these two classical writers, the effects of these different modes of study: as he wrote with his own pen, Hume, gave a greater terseness and compactness to his style, whereas I Smith, in dictating to an amanuensis, kept himself more in sympathy with his reader, and was more disposed, like a speaker, to flow and fluency. It may have been from the same circumstance that Hume wrote with great rapidity, whereas Smith composed as slowly, and with as great difficulty, at last as at first.

In Edinburgh, his studies were much interrupted by his

official duties, and often -- as he mentions in a letter written on his being elected by the students lord rector of his old University-did he cast a longing eye back upon the academic leisure he enjoyed in Glasgow. Like most men of high aims, he regretted, when he saw death approaching, that he had done so little. " I meant to have done more, and there are materials in my papers of which I could have made a great deal. But that is now out of the question." Shortly before his death, he gave orders to destroy all his manuscripts, which were supposed to contain his lectures on rhetoric, on natural religion, and on jurisprudence. He died in July, 1790.

Let us turn to his philosophy. His mind was essentially a reflecting one, a self-revolving one. He was always thinking, and talking to himself, gathering facts, forming theories, and seeking out events to confirm them; thus building up a system which was always ingenious, sometimes too ingenious, but {168} ever worthy of being weighed. His "Theory of Moral Sentiments " has commonly been a favorite with students, because of the eloquence of its language, modelled after the best philosophic writers of ancient Rome and modern France, and of the fertility of his resources in confirming his positions from his varied observation and reading. But his theory has gained the assent of few, and has often been prescribed by professors as a subject on which to exercise the critical acumen of their pupils. Adam Smith is always a discursive writer, and in the work now before us he wanders like a river amidst luxuriant banks, and it is not easy to define his course. Dugald Stewart in his "Memoir" has given the clearest account of it I have seen; and I mean to make free use of what he has written, in the shorter abstract which I submit.

According to the common moral theories, men first judge of their own actions, and then those of their neighbors. Smith reverses this, and maintains that the primary objects of our moral perceptions are the actions of other men. We put ourselves in their position, and partake with them in their affections by what he calls <sympathy> or fellow-feeling, which is the grand principle of his system. We thus judge of their conduct, and then apply to ourselves the decisions which we have passed on our neighbors, and which we may conceive they would pronounce on us. Our moral judgments, both with respect to others and ourselves, include two perceptions: first, of conduct as right or wrong; and, secondly, of the merit or demerit of the agent. When the spectator of another man's situation, upon bringing home to himself all its various circumstances, feels himself affected in the same manner with the person principally concerned, he approves of the affection or passion of this person as just, proper, and suitable to its object. We judge of the propriety of the affection of another only by its coincidence with that which we feel when we put ourselves in the same circumstances, and the perception of this coincidence is the foundation of the perception of moral obligation. Now this is a very circuitous way of gendering our moral ideas and judgments. Whether we look to ourselves or others, the mind pronounces a judgment upon the act, -- say a deed of benevolence or cruelty, -- and must do so according to some law which is the true basis of morality.

We are more likely to {169} pronounce first upon ourselves. But it may be acknowledged that it does help us in forming a correct judgment, to put ourselves in the position of others, and inquire how they would view us; and hence the important rule: " Whatsoever ye would that men should do unto you, do ye even so unto them." This is the element of truth in Smith's theory. In illustrating his views, he is particularly happy in showing how circumstances affect our moral judgments; that, for example, when there is no envy in the case, our sympathy with joy is much stronger than our sympathy with sorrow, and that in consequence it is more easy to obtain the approbation of mankind in prosperity than in adversity. From the same principle he traces the origin of ambition, or of the desire of rank and pre-eminence the great object of which passion is to attain that situation which sets a man most in view of general sympathy and attention, and gives an easy empire over the affections of others.

Having thus shown how we come to a sense of propriety (as he calls moral excellence), he proceeds to analyze our sense of merit and demerit, which have always a respect to the effect which the affection tends to produce. The only actions which appear to us deserving of reward are actions of a beneficial tendency, proceeding from proper motives, with which we can sympathize; the only actions which seem to us to deserve punishment are actions of a hurtful tendency, proceeding from improper motives. He accounts for our sense of justice by the circumstance that, if I wish to secure the sympathy and approbation of my fellow-men, -- represented by Smith as the strongest desire of our natures, -- it is necessary for me to regard my happiness not in that light in which it appears to myself, but that in which it appears to mankind in general, as if in all justice there was not an inflexible rule for judging of the conduct both of ourselves and others.

He then shows how our sense of duty comes to be formed in consequence of an application to ourselves of the judgments we have previously passed on others. In doing this we lay down rules of morality which become universally applicable. He allows to Hume that every thing approved of by the mind is useful and agreeable; but he insists that it is not the view of this utility which is either the first or principal source of moral approbation. {170}

Most people have felt that this theory is too artificial, -- is too ingenious to be true. It contains some elements of truth, but they are not put in their proper place; and the fabric is left without a sure foundation, -- virtue has no other foundation than the sympathy and approbation of men. The beauty of the building lies not in the structure as a whole, but in portions, often subordinate portions of it. His illustrations are abundant, and always felicitous; and many of them show a very nice and delicate perception of the peculiarities of human nature. We see this very specially in his chapter " Of the Influence of Custom and Fashion upon our Notions of Beauty and Deformity," -- perhaps the most valuable part of his work, as being that in which he sketches the various moral systems, such as those of the Stoics and Epicureans. Here he shows erudition, and

enters thoroughly into the spirit of the authors and their times. The work will continue to be read for its style and these adjuncts, by persons who set no value on the theory which be expounds.

Smith intended to write a connected history of the liberal sciences and elegant arts, but found the plan far too extensive. He has left us only a few fragments, which were published posthumously by Joseph Black and James Hutton. In these be discusses, always ingeniously, such topics as the nature of the imitation which takes place in what are called the imitative arts; the affinity between music, dancing, and poetry; the affinity between English and Italian verses. But the most valuable of these papers, are three on the principles which lead and direct philosophical inquiries, Illustrated by the history of astronomy, of ancient physics, of ancient logic and metaphysics, and one on the external senses.

The three philosophico-historical essays exhibit all the peculiarities of his mind: they are theoretical, they inquire into causes, and display an enlarged acquaintance with the sciences. He begins with showing that wonder called forth by the new and singular, surprise excited by what is unexpected, and admiration raised by what is great and beautiful, these -- and not any expectation of advantage, or the love of truth for its own sake-are the principles which prompt mankind to try to discover the concealed connections that unite the various appearances of nature, which give rise to the study of philosophy, {171} which is defined as the science of the connecting principles of nature. " Nature, after the largest expenditure that common observation can acquire, seems to abound with events which appear solitary and incoherent with all that go before them, which therefore disturb the easy movement of the imagination; and philosophy aims at discovering the invisible chains which bind together all the disjointed objects. Hence, in astronomy, the invention of eccentric spheres, of epicycles, and of the revolution of the centres of the eccentric spheres; in physics, the four elements; and in metaphysics and logic, species, essence, and ideas, -- all these give the imagination something to rest on." These motives have no doubt helped to create a taste for science, and often given it a particular direction; but many other causes have been in operation. It appears to me that, had Smith been able to devote as much time to a history of philosophy as he did to the "Wealth of Nations," and been in circumstances to review his theories from time to time, he might have written a better work than any produced in that century. No doubt he would at times have added a thought of his own to the account given of a philosophic opinion; but, following out his favorite principle of sympathy, he would always have put himself <en rapport> with the authors and their times.

His paper "Of the External Senses" is characterized by much sound sense and a profound study of the subject. He goes over the senses one by one. He has a glimpse of the important distinction -- afterwards carefully elaborated by Sir William Hamilton, and Miller the physiologist -- between the perception of the organ and of objects beyond the body.

Tasting, smelling, hearing, and certain sensations of touch, are altogether in the organ, and nowhere else but in the organ. But in regard to touching, " the thing which presses and resists I feel as something altogether different from these affections, as external to my hand, and as altogether independent of it." He represents the objects of touch as solidity, and those modifications of solidity which we consider as essential to it and inseparable from it, -- solid extension, figure, divisibility, and mobility." He defines the impenetrability of matter as " the absolute impossibility that two solid, resisting substances should occupy the same place at the same time." He expounds {172} a doctrine in regard to the so-called secondary qualities of matter or, to speak more properly, these four classes, of sensations heat and cold, taste, smell, and sound being felt not as resisting or pressing on the organ, but as in the organ." He says that they "are not naturally perceived as external and independent substances, but as mere affections of the organ, and what can exist nowhere but in the organ." This is perhaps a more philosophical account than that given by Locke, Reid, or Hamilton, who proceed on the distinction drawn between the primary and secondary qualities of matter. In regard to sight, he says the objects of it are color, and those modifications of color which in the same manner we consider as essential to it and inseparable from it, -- colored extension, figure, divisibility, and mobility." The tangible world has three dimensions, -- length, breadth, and depth; the visible world, only two, -- length and breadth. He recognizes Berkeley's theory of vision as "one of the finest examples of philosophical analysis that is to be found either in our own or in any other language; " and he quotes the Chiselden case. He notices the fact that, antecedent to all experience, the young of at least the greater part of animals possess some instinctive perception of distance. "The young partridge, almost as soon as it comes from the shell, runs about among the long grass and corn." He is inclined to think that the young of the human race may have some instinctive perception of the same kind, which does not come forth or manifest itself so strongly as in the lower animals, because mankind have greater aids from intelligence and education. He thinks that other senses, " antecedently to all observation and experience, may obscurely suggest a vague notion of some external thing which excites it. The smell not only excites the appetite, but directs to the object which can alone gratify that appetite. But, by suggesting the direction towards that object, the smell must necessarily give some notion of distance and externality, which are necessarily involved in the idea of direction." These hints are worthy of being carried out: they will certainly not be despised by those who in our day are studying hereditary instinct.

It does not consist with our purpose to give an account of his labors in political economy. I may remark, however, that in his work, and in every other, there is an omitted chapter, {173} which will require to be written by some one before the science is completed. In speaking of soil, labor, money, rent, and other external agents, there is no searching estimate of the internal motives which impel men to the acquisition and distribution of wealth. Some writers, such as James Mill, represent all men as swayed only by

self-love; others dwell fondly on such principles as a taste for literature or the fine arts: but there has been no discriminating computation of the springs of action, general and special, which lead men to make acquisitions, and which have produced different results in different ages and nations; for instance, to one form of civilization in Italy or in France, to others in Germany or in Scotland. Smith might have been tempted to set too high a value on certain influences which were favorites with him, but he was eminently fitted to begin the undertaking; and had he done so, he would have left us admirable illustrations of the power of motives actually swaying mankind.

XXII.-HENRY HOME (LORD KAMES).[44]

H/E\ was the son of George Home, of Kames, a country gentleman of small fortune, in Berwickshire, married to a granddaughter of Principal Baillie. He was born in 1696, and was educated at home, under a private tutor. It was in after life that he devoted himself to the study of Greek and Latin, to which be added mathematics, natural philosophy, logic, ethics, and metaphysics. He was never at any university. He showed an early taste for philosophical speculation. It seems that he came in contact with Andrew Baxter, who was tutor to a son of Mr. Hay, of Drumelzier, and lived at that time at Dunse Castle, within a few miles of Kames, and the two had a correspondence; Home arguing that motion was not a single effect, but a continued succession of effects, each requiring a new or a successive repetition of the cause to produce it. Like so many others in the same age, he had a thrust at Clarke's " Demonstration {174} of the Existence of God," and wrote, in 1723, a letter to the doctor. Already he is drawing up arguments against liberty of will. Having chosen the law as his profession, he was called to the bar 1723-24. As a pleader he began with a very short and distinct statement of the facts f the cause and a plain enunciation of the question of law thence arising, abandoning all the weaker points of the case. He excelled more in making an opening statement than in reply. We have a picture of his habits. He rose at five or six, and spent his morning in preparation for the business of the court. In the forenoon he was at the Court of Session, which, at that time, rose soon after mid-day. He did not go much out to dinner, as he needed all his time for business and study. In the evening, if he had leisure, he joined the ladies in the drawing-room, or took part in a game of cards, or might be seen at the concert or the assembly room. "The evening was generally closed by a small domestic party, where a few of his intimate friends assembled, for the most part without invitation; found a plain but elegant little supper , and where, enlivened often by some of Mrs. Home's female acquaintance, the hours were passed in the most rational enjoyment of sensible and spirited conversation, and easy social mirth, till after midnight."

Throughout his life he published various works on law and jurisprudence; beginning, in 1728, with a folio volume of " Remarkable Decisions of the Court of Session " from 1716 down to that period. In 1752 he was appointed a judge of the Court of Session, by the title of Lord Kames.

But his tastes ever led him towards metaphysical speculation. From 1727 he had been acquainted with David Hume, and he carefully studied his writings as they were published. It seems he had dissuaded the sceptic from publishing his "Philosophical Essays," and he felt himself called to oppose what he believed to be the extreme views there propounded. This gave rise, in 1751, to a work which produced a great noise in his own day, " Essays on the Principles of Morality and Natural Religion." It was published under the name of "Sopho." He shows that man is influenced by a great number and variety of principles, such as self-love, benevolence, sympathy, and utility, consonance to the divine will; and that his actions are most frequently the combined result of the opposite {175} springs, tempering and restraining each other's powers. He shows that man has, as a separate principle, in his nature and constitution, a moral feeling or conscience, the function of which is to judge with unerring rectitude of all his motives to action, and direct his conduct to one great and beautiful end, -- the utmost happiness of his nature. In expounding these views, he examines Hume's theory, and shows that it annihilates all real distinction between right and wrong in human actions, and makes our preference of one or other depend on the fluctuating opinions of men in respect to the general good. In particular, he opposes Hume's view of justice, and shows that the idea of property is coeval with society, and that its violation is universally attended with a feeling of a breach of duty, which is the sentiment of justice. He sets himself specially to oppose Hume's attempt to undermine the arguments in behalf of the Divine Existence.

In developing his moral and esthetic views, in this and in other works, he enunciates his metaphysical principles. He maintains that man can acquire intuitive knowledge from a single act of perception. "It is an undoubted truth that man has an original feeling or consciousness of himself and of his existence." He maintains (" History of Man,") that there is a sense by which we perceive the truth of many propositions: such as that every thing which begins to exist must have a cause; that every effect adapted to some end or purpose proceeds from a designing cause; and that every effect adapted to a good end or purpose proceeds from a designing and benevolent cause. A multitude of axioms in every science, particularly in mathematics, are equally perceived to be true. By a peculiar sense we know that there is a Deity. From all this it is evident that he stood up for intuitive principles.

There must surely be truth in the account he gives of power; so different from that of Locke on the one hand, and that of the high <a priori> philosophers on the other. " Every action we perceive gives a notion of power; for a productive cause is implied in every action or event, and the very idea of a cause comprehends the power of producing its effects. Let us only reflect on the perception we have when we see a stone thrown into the air out of one's hand." "As I discover power in external objects by the eye, so I discover power in {176} my mind by an internal sense." "This feeling is involved in the very perception of the action, without taking in either reason or experience." "We cannot

discover power in any object as we discover the object itself, merely by intuition; but the moment an alteration is produced by any object, we perceive that the object has a power to produce that alteration, which leads us to denominate the one a cause and the other an effect." It is generally acknowledged that we know objects within and without us only by their properties; but what are properties but powers, which must thus be known intuitively with the objects that possess them.

But the doctrine which startled the public was that of philosophical necessity, as expounded and defended by him. It is a circumstance worthy of being noted that this doctrine was upheld by three men, who arose about the same period and in much the same district of country, -- David Dudgeon, David Hume, and Henry Home; it looks as if it were the residuum left by the doctrine of predestination, when the flowing waters of the stream have been dried up by an and period. " With respect to instinctive actions, no person, I presume, thinks that there is any freedom; an infant applies to the nipple, and a bird builds a nest, no less necessarily than a stone falls to the ground. With respect to voluntary actions done in order to produce some effect, the necessity is the same, though less apparent at first view. The external action is determined by the will; the will is determined by desire , and desire, by what is agreeable or disagreeable. Here is a chain of causes and effects, not one link of which is arbitrary, or under command of the agent. He cannot will but according to his desire; he cannot desire but according to what is agreeable or disagreeable in the objects perceived. Nor do these qualities depend on the inclination or fancy: he has no power to make a beautiful woman appear ugly, nor to make a rotten carcase smell sweetly." "Thus, with regard to human conduct, there is a chain of laws established by nature, no one link of which is left arbitrary. By that wise system man is made accountable; by it he is made a fit subject for divine and human government; by it persons of sagacity foresee the conduct of others; and by it the presence of the Deity with respect to human actions is clearly established." He founds the responsibility of man upon this very doctrine. {177} "The final cause of this branch of our nature is admirable. If the necessary influence of motives had the effect either to lessen the merit of a virtuous action, or the demerit of a crime, morality would be totally unhinged." In regard to liberty, man acts with the conviction of his being a free agent, and is quite as much accountable as if he were truly free. The answer to all this is, that man has an intuition in regard to his possessing freedom quite as deep and ineradicable as his intuition about cause and effect. If we attend to the latter of these, and adhere to it, as Home does, we should equally hold by the other.

The friends of religion, unenlightened and enlightened, felt at once that there was something here repugnant to all that they had been led to believe about God and man; and Henry Home came to be put in the same class with David Hume, to whom he was in many respects opposed. In 1753, there appeared " An Estimate of the Profit and Loss of Religion, illustrated with References to Essays on Morality and Natural Religion." The author was Rev. George Anderson, who

had been an army officer, and was now chaplain to Watson's Hospital in Edinburgh, and who wrote some tracts against the stage, and a " Remonstrance against Bolingbroke's Philosophical Religion." He is described, by Home's biographer, as " a man of a bold spirit and irascible temperament, and considerable learning." This gave rise to other pamphlets, as " A Letter to the Author of a late Book entitled an I Estimate of the Profit and Loss of Religion."' Anderson sets him self in opposition to those who say that Christianity is not founded on argument, and to Sopho, Hume, and Hutcheson. " Feelings being so uncertain and variable, it is most ridiculous to found upon them a law so important and extensive as is the law of nature." He prefers the ground taken by Clarke and Cumberland. As to the scheme of necessity, it is no other than that of Collins. " That Sopho's (Home's) principles serve the cause of atheism will be plain enough to any who duly consider the consequences of his scheme of necessity, which excludes a providence and binds up the Almighty in the same chain of fate with all other intelligent beings."[45] There appeared in 1755 "An Analysis {178} of the Moral and Religious Sentiments contained in the Writings of Sopho and David Hume, Esq., addressed to the Consideration of the Reverend and Honorable Members of the General Assembly.[46] The author denounces Home as maintaining that man is a mere machine, under an irresistible necessity in all his actions, and yet, " though man be thus necessarily determined in all his actions, yet does he believe himself free, God having planted in his nature this deceitful feeling of liberty," this deceitful feeling being the only foundation of virtue. He argues that from this doctrine it follows, as a necessary consequence, that there can be no sin or moral evil in the world.[47] As to Hume, he is charged with making all distinction betwixt virtue and vice as merely imaginary: "Adultery is very lawful, but sometimes not expedient." This letter was met by a pamphlet, " Observations on the Analysis," generally attributed to Blair, "who is believed likewise to have lent his aid to the composition of a formal reply made by Mr. Home himself, under the title of "Objections against the `Essays on Morality and Natural Religion' examined, 1756." {179}

In all this we have an able and legitimate discussion. But the opponents of the rising scepticism resorted to other and more doubtful steps. Henry Home, it is presumed, was a member of the Church of Scotland, and it would have been quite within the province of that church to summon him before it, and inquire into the opinions which 'he was believed to be propagating. Over David Hume, it is clear that the church had no jurisdiction. But the Church of Scotland claimed to be the guardian of religion in the country, and to have an authority to prevent the circulation of error. So a motion was made in the committee of overtures of the General Assembly that the body should take into their consideration how far it was proper to call before them and censure the authors of infidel books. "There is one person, styling himself David Hume, Esq., hath arrived at such a degree of boldness as publicly to avow himself the author of books containing the most rude and open attacks on the glorious gospel of Christ, and principles evidently subversive even of natural religion and the foundations of

morality, if not establishing direct atheism: therefore, the Assembly appoint the following persons as a committee to inquire into the writings of this author. to call him before them, and prepare the matter for the next General Assembly." `I here was a keen debate in the committee for two days. It was moved in opposition, " that although all the members have a just abhorrence of any principles tending to infidelity or to the prejudice of our holy religion; yet, on account of certain circumstances in this case, they drop the overture, because it would not, in their judgment, serve the purpose of edification." The question being put, "transmit the overture to the Assembly or not," it passed in the negative by a majority of fifty to seventeen votes. After this, Mr. Anderson gave in a petition and complaint to the Presbytery of Edinburgh against the printer and publisher of the " Essays on the Principles of Morality and Natural Religion," requiring that the presbytery should summon them to appear before them and declare the name of the author of that work, that he might be censured according to the law of the gospel and the practice of this and all other well-governed churches." The defenders appeared by counsel. Meanwhile Mr. Anderson was summoned away by death from the scene. The case, however, goes on to a decision on the {180} merits, and the complaint is rejected. These incidents give us a more vivid picture of the times than any generalized statements. It is evidently the good function of the rising Moderate party in the church to restrain the intemperate zeal of those who would lay restraint on liberty of thought and writing, who would claim for the church a power not committed to it, and meet error with other weapons than argument.

Meanwhile there are able thinkers preparing to meet the scepticism both of Hume and Home, by well-established philosophic principles. We shall see that Reid and James Gregory, in particular, came forth to defend the doctrine of the freedom of the will. A curious cross-fight was produced at this stage by the introduction into Scotland of Edwards' " Treatise on the Will." In the pamphlet published in defence of Home, it is urged that, " among the list of subscribers to Edwards' book are many members of this church; and it was dispersed last year in this city by the most zealous friends to religion and true Calvinism." It is clear that Home and his friends wished to shelter themselves under the Calvinism of the Church of Scotland; and the pamphlet quotes Calvin, Turretin, and Pictet. It might have been urged in reply that Calvin stands up for an essential freedom of the will, possessed by all responsible beings; and that the reformers generally, in holding by a slavery of the will, meant a slavery produced by the fall of man and by sin. As to Edwards' doctrine, it is a metaphysical one not before the mind of the reformers; and it is so explained and illustrated by the author as to make it have a very different aspect and practical tendency from that propounded by the Scottish necessarians.

The " Essays on Morality" was the work of Home that produced the greatest sensation. It was followed by other philosophical works. In 1761, he published his "Introduction to the Art of Thinking," in which shrewd metaphysics and practical remarks are grafted on the old logic. For several

years be had meditated an extensive work on the principles of criticism, which would inquire into the causes of that pleasure which is derived from the production of poetry, painting, sculpture, music, and architecture. The work appeared in I 762, under the title of " Elements of Criticism." It is gracefully {181} written: it treats of all the subjects usually discussed in books of rhetoric, and shows an extensive reading in the great classical writers of ancient and modern times. He professes to found the whole upon a philosophic basis. But his analysis of the mental principles involved does not seem to me to be very searching or profound. What is the use of telling us, What is now said about the production of emotion or passion resolves into a very simple proposition, that we love what is agreeable and hate what is disagreeable"? He does not follow the Scottish metaphysicians in resolving beauty into association of ideas. He discovers a beauty that is intrinsic as well as a relative beauty.

For years he was collecting materials for a work on man, which appeared in 1774 under the title of " Sketches of the History of Man." This work is meant to describe the progress made by man, in respect of language, food, commerce, the arts, science, government, morality, and religion. He is inclined to think that, as there are different climates, so there are different species of men fitted for these climates, and argues that we cannot account for the differences of mankind by climate or by external agencies. He would believe that there must have been an original difference of languages; but, yielding to the Scriptures, he accounts for the diversities by the confusion of tongues at Babel. He is fond of discovering every where a final cause on the part of God, and a progress on the part of man. He has collected what seems a wide induction of facts; but there is a great want of what Bacon insists on as a necessary part of all legitimate induction, -- " the necessary rejections and exclusions."

He was married to Miss Drummond, by whom he became possessed of one of the most beautiful places in Scotland, Blair Drummond, -- on the banks of the Teith, half way between hill and dale, -- in the south of Perthshire. Home was one of the earliest of those agricultural improvers who became very numerous, from this time onward, for an age or two among those lawyers of Edinburgh who possessed landed estates. He took a lead first at Kames, and then at Blair Drummond, in summer-fallow, and in raising green crops and sown grass. His great agricultural work, which made him famous all over Scotland, consisted in clearing the moss of Kincardine, which {182} extended four miles in length and one or two miles in breadth, and was covered with turf, eight or nine feet in thickness, and underneath which was a rich soil. He effected this by giving the land for a time to moss-planters, who floated away the turf by means of ditches which he dug. He was a leading member of the Board of Trustees for the Encouragement of the Fisheries, Arts, and Manufactures of Scotland, and of the Commission for the Management of Forfeited Estates, the rents of which were to be applied to the improvement of the highlands and islands of Scotland. By means of these boards he did much to stimulate the industry of Scotland. It is asserted that he

did more than any man in his time in encouraging the introduction of " new modes and instruments of industry, the enclosure and culture of wastes and moors, the rearing of forest timber, the draining and cultivation of moss lands, the raising and spinning of flax, the growth and storing of winter fodder for cattle, the improvement of the breed of sheep, and the manufacture of coarse woollen stuffs."

In his old age he published " Loose Hints on Education." He thought that religion should form a main branch of education even in the earliest period of infancy, and that the parents or preceptor should acquaint the child with the fundamental doctrines of revealed religion. The common opinion of him was, that he must be a man devoid of all religion. But a clergyman writes " I have heard him mention the light of immortality as an excellence peculiar to the doctrine of Christ. He gave unqualified praise to Butler's `Analogy,' which is a defence of revealed as well as of natural religion. He was regular in his attendance upon public worship; and during my abode with him he had divine worship in his family every evening." It is interesting to notice that he defends the Scottish view of the Sabbath. " This consideration leads me necessarily to condemn a practice authorized among Christians, with very few exceptions; that of abandoning to diversion and merriment what remains of Sunday after public worship, parties of pleasure, dancing, gaming, any thing that trifles away the time without a serious thought; as if the purpose were to cancel every virtuous impression made at public worship." (" Sketches of the History of Man," B. III.) {183}

In his person he was tall and of a thin and slender make. His portrait shows a high, marked brow; a long nose; and a shrewd, humorous face, -- altogether a strong-marked countenance. "In his manners there was a f rankness amounting to bluntness, and in his conversation a humorous playfulness." He died Dec. 27, 1782, in the eighty-seventh year of his age.

XXIII. -- AMERICAN PHILOSOPHY. -- JOHN WITHERSPOON.

A/MERICA\ was now reaching such a settled condition that reflective thought could make its appearance. Underneath the Puritan action and self-sacrifice, there was a Puritan faith which required men to judge and reason. American philosophy put forth at that time its greatest representative. Jonathan Edwards was born in Connecticut, in 1703; was a tutor in Yale in 1724; was pastor and missionary from 1726 to 1757; and died President of Princeton College, in 1758. From his very childhood he pondered the profoundest subjects, and penetrated as far as -- at times farther, some think, than -- human thought could carry him. Possessed of no great variety of reading, he reached his very definite opinions, by revolving every subject in his own mind. I am inclined to think that his opinions might have been modified, had he been brought more fully into contact and collision with other thinkers. His " Freedom of the Will " is the acutest work ever written on that perplexing subject; but many think that he has overlooked an essential freedom in the mind, acknowledged by Calvin, Owen, and the great Calvinistic divines, and revealed by consciousness. He is

known more as a theologian than a philosopher; but the fact is, his metaphysics, always along with his deep spiritual insight, are the valuable element in his divinity. Contemporaneously with Berkeley, he arrives at a doctrine of power and of body,-not the same with that of the ideal bishop, but coming close to it and perhaps of a more consistently philosophic structure. Cause he explains to be " that after or upon the existence of which, or its existence after such a manner, the existence of another thing follows. The connection between these two existences, or between the cause and effect is what is called power." "When we say that grass is green, all that we can mean is, that, in a constant course, when we see grass, the idea of green is excited by it" " What idea is that which we call by the name of body? I find color has the chief share in it. `Tis nothing but color, and figure, which is the termination of this figure, together with some powers, such as the power of resisting and motion, that wholly takes up what we call body, and if that which we principally mean by the thing itself cannot be said to be in the thing itself, I think {184} nothing can be. If color exists not out of the mind, then nothing be longing to body exists out of the mind, but resistance, which is solidity, and the termination of this resistance with its relations, which is figure, and the communication of this resistance from place to place, which is motion; though the latter are nothing, but modes of the former. Therefore, there is nothing out of the mind but resistance; and not that either, when nothing is actively resisted. Then there is nothing but the power of resistance. And, as resistance is nothing but the actual exertion of God's power, so the power can be nothing else but the constant law or method of that actual exercise." (Notes on Mind, in Dwight's " Life of Edwards.")

It could be shown that, at this time, there was everywhere a tendency towards idealism among the higher minds, which had been trained under the philosophy of Locke. The Rev. Samuel Johnson, the tutor of Edwards in Yale, who afterwards wrote " Elementa Philosolphica," welcomed Berkeley on his coming to Rhode Island, and adopted his philosophy. Berkeley was personally beloved by all who came in contact with him, and gained some devoted adherents to his theory. In Princeton College, Mr. Meriam, a tutor, defended the system. But idealism has never struck deep into the American soil. The " Scottish Philosophy," coming in with the great Scotch and Scotch-Irish migration, which, next to the Puritan, has had the greatest power for good on the American character, has had much greater influence. Edwards was acquainted with the moral theory of Hutcheson, which makes virtue consist in benevolence; but propounded one of his own, somewhat akin to it, but much more profound, making virtue consist in love to being as being. I feel that I must take a passing notice of the energetic man who actually introduced Scottish thought into the new world.

John Witherspoon[48] was the son of a minister of the Church of Scotland, and was born February 5, 1722, in the parish of Yester, in East Lothian, the probable birthplace of Knox. He entered the university of Edinburgh, at the age of fourteen, and pursued his studies there for seven years, with such fellow-students as Blair, Robertson, and John

Erskine. Carlyle, who could not have been specially inclined towards him, is obliged to say that " he was open, frank, and generous, pretending to what he was, and sup porting his title with spirit." " At the time I speak of, he was a good scholar, far advanced for his age, very sensible and shrewd, but of a disagreeable temper, which was irritated by a flat voice and awkward manner, which prevented his making an impression on his contemporaries at all adequate to his abilities." Descended from Knox, through his heroic daughter, Mrs. Welch, who told King James that she would rather " kep his head in her lap" than have him submit to the king's supremacy in {185} religion," young Witherspoon inherited the spirit of the reformer,[49] -- his devoted piety, his keen perception of abounding evil, his undaunted courage, his unflinching perseverance, and, I may add, his vigorous sense and his broad humor. He was settled as minister, first in Beith in Ayrshire, famous for its cheese, and then in Paisley, famous for its shawls and for the piety of its older inhabitants; and in both places was an effective, popular preacher, and wrote works -- such as his Treatises on justification, and on Regeneration -- which continue to be read with profit to this day.

He perceived clearly and felt keenly the great change which was coming over the Church of Scotland: he watched carefully the rise and progress of moderatism, tracing it to the restoration of church patronage, and to the philosophy of Shaftesbury and Hutcheson, favored by a young race of divines, who seemed to him to be addicted to levity in their whole character, to be ready to abandon the old truths, and to trample on the spiritual rights of the people. He did not scruple to satirize it in a work, published anonymously, and distinguished for its plain speaking and its humor, scarcely inferior in power to the sarcasm of Swift, and having a much higher aim, -- " Ecclesiastical Characteristics, or the Arcana of Church Policy: Being an humble attempt to open the mystery of moderation, wherein is shown a plain and easy way of attaining to the character of a moderate man, as at present in repute in the Church of Scotland," " Oh, yes! fierce for moderation." " When any man is charged with loose practices or tendencies to immoralities, he is to be screened and protected as much as possible; especially if the faults laid to his charge be -- as they are incomparably termed in a sermon, preached by a hopeful youth, that made some noise lately -- `good-humored vices."' " It will serve further for the support of this maxim, that, according to modern discoveries, there is a great analogy between the moral virtues, or, if you will, the science of morals, and the fine arts: and it is on account of this analogy that most of the present reigning expressions upon the subject of morals are borrowed from the arts; as, beauty, order, proportion, harmony." "Another thing strongly pleads for gentlemen having the chief hand in settling kirks, that nowadays very few of our principal gentry attend ordinances, or receive any benefit by a minister after he is settled, unless perhaps talking of the news at a private visit or playing a game at backgammon." " As for logic, it is well known this part of education is fallen into great contempt, and it is not to be expected that such brisk and lively spirits, who have always hated every thing that looked scholastic-like, can bear to be tied down to the strict

rules of argumentation." " It illustrates the truth of Mr. H -- 's doctrine: that virtue is founded upon instinct and affection, and not upon reason; that benevolence is its source, support, and perfection; and that all the particular rules of conduct are to be suspended when they seem to interfere with the general good." This satire cut deep, and he was attacked on all hands, for resorting to such a weapon. He {186} defended himself in a " Serious Apology for the Ecclesiastical Characteristics,' by the real author of that performance." One other reason I shall mention for making choice of this way of writing was drawn from the modern notions of philosophy, which had so greatly contributed to the corruption of the clergy. The great patron and advocate for these was Lord Shaftesbury, one of whose leading principles it is, that I ridicule is the test of truth.' This principle of his had been adopted by many of the clergy; and there is hardly any man conversant in the literary world, who has not heard it a thousand times defended in conversation. I was there fore willing, to try how they themselves could stand the edge of this weapon." Taking his part in the controversy raised by the publication of Home's " Douglas," he published "A Serious Inquiry into the Nature and Effects of the Stage." Robertson, now acknowledged as the consummately able leader of the moderate party, found at times a powerful opponent in Witherspoon. Dr. Robertson had remarked that, with a real minority, the moderate party had been able to carry their measures; whereupon Witherspoon said: `We allow you whatever merit you may be entitled to for your skill, but remember the authority which says, I the children of this world are wiser in their generation than the children of light.' " One day after Witherspoon had carried some important questions in the General Assembly, Dr. Robertson said to him in a pleasant and easy manner: " I think you have your men better disciplined than formerly," a remark showing how much value lie set on skilful leadership. " Yes," replied Witherspoon, "by urging your politics too far, you have compelled us to beat you with your own weapons." He acts in character throughout, and as if be still lived in the seventeenth century. On the night before the communion sabbath, it is reported that a set of youths, following the example set in the " hell-fire clubs," to which I have referred (p. 19), held a meeting for mock preaching and praying. This was an awful scene to been acted, in so godly a town as Paisley, where, on a sabbath morning, family praise might be heard rising from every dwelling; and Witherspoon a fortnight after, Feb. 21, 1762, preaches " a seasonable advice to young persons," and publishes it with the names of the offenders. But he is living in the eighteenth and not the seventeenth century, and a lawyer started an action and got costs, which greatly embarrassed the doctor. All these things -- the enemies raised up by the " Characteristics," and these local troubles -- must have made Scotland somewhat too hot for him, the more so that the law was against him, and the church party opposed to him was increasing in power and in imperiousness. He had a brave heart and could have stood it all. But it was at this juncture that there came an invitation to him to become president of the college of New Jersey, Princeton. He did not listen to that call when it was first made in 1766; but he accepted it in 1768, and was inducted as president, Sept. 28 of that year. He had now a

far wider field opened to him than ever he could have had in his own country, where all the civil patronage and the literature of the age were against him He has evidently fallen into his predestined sphere, and feels that he has a fitness, a taste, and a talent for the work.

The course of instruction followed in the college during his administration {187} was a good one. "In the first year, they read Latin and Greek, with the Roman and Grecian antiquities and rhetoric. In the second, continuing the study of languages, they learn a complete system of geography with the use of the globes, the first principles of philosophy, and the elements of mathematical knowledge. The third, though the languages are not wholly omitted, is chiefly employed in mathematics and natural Philosophy, and the senior year is employed in reading the higher classics, proceeding in the mathematics and natural philosophy, and going through a course of moral philosophy." In addition, Dr. Witherspoon delivered lectures to the juniors and seniors upon chronology and history, and upon composition and criticism, and taught Hebrew and French to those who wished it. During the whole course of their studies, the three younger classes, two or three every evening, were called to pronounce an oration on a stage erected for the purpose, immediately after prayers, " that they may learn, by early habit, presence of mind and proper pronunciation and gesture in public speaking." " The senior scholars, every five or six weeks, pronounce orations of their own composition, to which all persons of any note in the neighborhood are invited or admitted." (" Address by Witherspoon in behalf of the College of New Jersey.") It will be observed that in this last provision, that for public speaking, there is something not found in the European colleges. The course as a whole is good; but the State of New Jersey would not furnish funds, and private benevolence did not supply sufficient means to procure an adequate number of instructors. By means of this instruction, even with its scanty staff of teachers, the college in that age raised, not only a large body of devoted ministers. but a great number of the ablest statesmen and lawyers of which America can boast, and furnished professors to a great many colleges, west and south.[50] Witherspoon took four different departments, composition, taste, and criticism; chronology and history; moral philosophy; and divinity. Many of his pupils have testified to the benefit which they derived from his instructions, so sagacious, so stimulating and practically useful. In particular, James Madison, perhaps the most philosophical of all the founders and framers of the American constitution, acknowledges his obligations to the study of moral philosophy under Witherspoon. "The increased attention paid to the study of the nature and constitution of the human mind, and the improvements which had been introduced into this fundamental department of knowledge by the philosophical inquiries of his own countrymen, constituted a marked and most important feature of Dr. Witherspoon's reforms. Mr. Madison formed a taste for these inquiries, which entered deeply, as we shall hereafter have occasion to remark, into the character and habits of his mind, and gave to his political writings in after life a profound and philosophic cast, which distinguished them eminently and favorably from the

production of the ablest of his contemporaries." (" Life and Times of Madison," by William C. Rives.)

President Ashbel Green tells us, "The Berkeleyan system of metaphysics was in repute in the college when he entered. The tutors were zealous {188} believers in it, and waited on the president with some expectation of either confounding him, or making him a proselyte. They had mistaken their man. He first reasoned against the system, and then ridiculed it till he drove it out of the college. The writer has heard him state, that, before Reid or any other author of their views had published any theory on the ideal system, lie wrote against it, and suggested the same trains of thought which they adopted, and that he published his essay in a Scotch magazine." He refers in his moral philosophy to the common-sense school of Scotland. " Some late writers have advanced, with great apparent reason, that there are certain first principles or dictates of common-sense, which are either simple perceptions or seen with intuitive evidence. These are the foundation of all reasoning, and, without them, to reason is a word with out a meaning. They can no more be proved than you can prove an axiom in mathematical science. These authors of Scotland have lately produced and supported this opinion, to resolve at once all the refinement and metaphysical objections of some infidel writers. (" Moral Philosophy," sect. v.) His son-in-law, and his successor as president, Samuel Stanhope Smith, at one time inclined to Berkeleyanism, formally renounces idealism. " Whatever medium, in the opinion of these philosophers (Locke, Berkeley, and Hume), nature may employ to connect the object with the organ of sense, whether image or idea, or any other sensible phantasm, it is, beyond a doubt the object itself, not its idea, which is discovered by the sense; any image or phantasm, in the case, being either unknown or unperceived, and at the time wholly unthought of. An idea is merely a conception of the fancy, or the reminiscence of the object."[51] From this date, the Scottish became the most influential philosophy in America.

His work on moral philosophy is not particularly profound or interesting. But I suppose we have only the skeleton of his course; and, as he illustrated it orally by his reading and wide observation of mankind, I believe it was useful and attractive. He discussed such authors as Leibnitz, Clarke, Hutcheson, Wollaston, Collins, Nettleton, Hume, Kames, Adam Smith, Reid, Balfour, Butler, Balguy, Beattie. He had vigorously opposed Hutcheson in Scotland, and he sees the logical result of his view of virtue in the systems of Hume and Home, who are criticised by him. He refers to the theory of his predecessor in office, Edwards, that " virtue consists in the love of being as such," but without approval. His own view is summed up in these words: " There is in the nature of things a difference between virtue and vice; and, however much virtue and happiness are connected by the divine law and in the event of things, we are made so as to feel towards them and conceive of them as distinct, -- we have the simple perceptions of duty and interest." " The result of the whole is, that we ought to take the rule of duty from conscience, enlightened by reason, experience, and every way by which we can be supposed to learn the will of our Maker." {189}

But Witherspoon was a man of action, rather than reflection. His administration of the college seems to have been successful. Following the original theory of the American college, Princeton college was placed in a village supposed to be away from the temptations of great cities. " It is not," Witherspoon says, " in the power of those who are in great cities to keep the discipline with equal strictness where boys have so many temptations to do evil, and can so easily and effectually conceal it after it is done. With us, they live all in college, under the inspection of their masters; and the village is so small that any irregularity is immediately and certainly discovered, and therefore easily corrected." The rules of government which he explained to the tutors are admirable. " Govern, govern always, but beware of governing too much. Convince your pupils, for you may convince them, that you would rather gratify than thwart them; that you wish to see them happy; and desire to impose no restraints but such as their real advantage, and the order and welfare of the college, render indispensable. Put a wide difference between youthful follies and foibles, and those acts which manifest a malignant spirit or intentional insubordination. Do not even notice the former, except it be by private advice. Overlook them entirely, unless they occur in such a public manner that it is known that you must have observed them. Be exceeding careful not to commit your own authority or that of the college, in any case that cannot be carried through with equity. But having pursued this system, then, in every instance in which there has been a manifest intention to offend or resist your authority, or that of the college, make no compromise with it whatever: put it down absolutely and entirely. Maintain the authority of the laws ,in their full extent. and fear no consequences."

But his influence was exerted and felt far beyond the college walls. As might have been expected from his love of liberty, and his impetuous spirit, and the part he took in Scotland, be early threw himself into the struggle for independence, and he was elected a representative in Congress for the State of New Jersey, in 1776, and declared there the way by which he had been led. " We were contending for a restoration of certain privileges under the government of Great Britain, and were praying for a reunion with her. But in the beginning of July, with the universal approbation of all the States now united, we renounced this conviction, and declared our selves free and independent." His is one of the names -- the most honored of any in America-attached to the Declaration of Independence, and his portrait adorns Independence Hall. I rather think that-if we except Washington, Franklin, and perhaps half a dozen others -- none bad so important an influence as Witherspoon in guiding the American Revolution. It will be remembered that one of the decisive battles of the war was fought at Princeton; and, in 1783, the Congress sat for months in the college, presided over by one of the trustees, and with Witherspoon as a member. When in Congress, he exerted himself to secure a firm, central government, and a gold instead of a paper standard. He retired from Congress in 1783, to give himself to his college work. He died, Nov. 15, 1794. {190} From the picture of him by the elder Peale in Princeton college, and

the account given by Ashbel Green, we learn that " his stature was of middle size, with some tendency to corpulence. His limbs were well-proportioned, and his complexion was fair. His eyes were strongly indicative of intelligence. His eyebrows were large, hanging down at the ends next his temples, occasioned, probably, by a habit he had contracted of pulling them when he was under excitement." His whole air is that of a man of strong character; and we see traces of his being naturally a man of strong passion, which, however, he was able to subdue. Scotland did not allow him, what would have been for her good, to become a leader of men; and Scotland's loss became America's gain.

XXIV.-JAMES BALFOUR.

H/E\ was a member of the Scotch bar, and one of the many Edinburgh lawyers who devoted themselves to philosophy. He was one of the first to write against the ethical principles of Hume, which he did in his " Delineations of the Nature and Obligations of Morality," published anonymously, 1752 or 1753. He sets out with the principle that private happiness must be the chief end and object of every man's pursuit; shows how the good of others affords the highest happiness; and then to sanction natural conscience be calls in the authority of God, who must approve of what promotes the greatest happiness. This theory does not give morality a sufficiently deep foundation in the constitution of man or the character of God, and could not have stood against the assaults of Hume. In 1754, he was appointed professor of moral philosophy in the university of Edinburgh, the chair which David Hume had wished to fill some years before, -- and continued to hold it till 1764, when be became professor of the law of nature and nations, and held the office till about 1779. In 1768, he published a second work, written against Hume and Lord Kames and in defence of active power and liberty. Like all enlightened opponents of the new scepticism, he felt it necessary to oppose the favorite theory of Locke, that all our ideas are derived from sensation and reflection. " It may indeed be allowed that the first notions of things are given to the mind by means of some sensation or other; but then it may also be true that after such notions are given the mind, by the exertion of some inherent power, may be able to discover some remarkable qualities of such things, and even things of a very different nature, which are not to be discovered merely by any sense whatever." He published " Philosophical Dissertations," in 1782.

He was born in 1705, and died 1795. His father was a merchant in Edinburgh, and his mother a daughter of Hamilton of Airdrie, from which family Sir William Hamilton was descended. He seems to have received his education first in Edinburgh College, and then, like so many scholars of the preceding ages, at Leyden. {191}

XXV. -- ALEXANDER GERARD.

H/E\ was the son of the minister of a parish, called the chapel of Garioch, in Aberdeenshire, and was born in 1728. In July, 1752, lie was admitted professor of moral

philosophy in Marischal College. In August, 1755, he submits in a printed paper an improved plan of education for the college. He argues powerfully against the established practice of reaching logic in the early years of the course. He recommends that the curriculum consist: First year, classics; second year, history and elementary mathematics; third year, natural philosophy, with belles-lettres and mathematics; fourth year, pneumatology, or natural philosophy of spirit, including the doctrine of the nature, faculties, and states of the human mind, and natural theology; moral philosophy, containing ethics, jurisprudence, and politics, -- the study of these being accompanied with a perusal of some of the best ancient moralists; logic, or the laws and rules of inventing, proving, retaining, and communicating knowledge; and metaphysics. This is, in many respects, an enlightened course, but confines the attention of every student too exclusively to one department for the year, -- whereas the mind works better with some variety, -- and does not give a sufficient space to classics and English. This course was substantially adopted by the college, which thus came to differ from the other Scotch universities.

It is indicative of a strong desire on the part of an enlightened body of men to promote elegance and refinement in their country, that the Edinburgh Society for the Encouragement of Arts, Sciences, Manufactures, and Agriculture offered a premium for the best essay on "Taste," the phrase " taste " having come unfortunately into use as the translation of the French "gout" The prize was gained by Gerard, and the work was published in 1759, the publisher adding three dissertations by Voltaire, D'Alembert, and Montesquieu. Anxious to promote the objects of the above-named society, he offered through it a gold medal on style in composition. In the same year, he was chosen professor of divinity in Marischal, and, in 1773, he became professor of divinity in King's College, and his attention was thus called away from philosophy. In 1766, he published " Dissertations on Subjects relating to the Genius and Evidences of Christianity." Still cherishing his old tastes, he published, in 1774, an " Essay on Genius," meant to be the complement of his work on ,Taste." He wrote also "Sermons," in two volumes; "The Pastoral Care;" and "The Evidences of the Christian Religion."

He is best known by his work on " Taste." He enlarges the number of senses or tastes far beyond what Hutcheson or any other has done, -- illustrating the sense or taste of novelty, sublimity, beauty, imitation, harmony, oddity and ridicule, and virtue, and shows bow they all enter into fine taste He calls them internal or reflex senses, as distinguished from external senses. He does not enter upon a searching inquiry into their psychological nature, nor seek to determine what objective reality is implied in them: he contents himself with a graceful pleasant exposition and illustration. {192} In his other philosophical work, he describes genius as the faculty of invention, treats of such interesting subjects as the influence of habit and passion on association, and quotes largely from the best writers of Greece and Rome, France and England; but shows little analytic or metaphysical acumen. By his lectures and works,

he helped to create and foster a literary taste in the region of which Aberdeen claims to be the capital, and is believed to have had influence on the studies and teaching of Beattie. Beattie is said to allude to him, when he speaks of a person who "by two hours' application could fix a sermon in his mind so effectively as to be able to recite it in public without the change, omission, or transposition of a single word." He died in 1795 [52]

XXVI. -- THOMAS REID.[53]

I/F\ he was not the founder, he is the fit representative of the Scottish philosophy. He is in every respect, a Scotchman of the genuine type: shrewd, cautious, outwardly calm, and yet with a deep well of feeling within, and capable of enthusiasm; not witty, but with a quiet vein of humor. And then he has the truly philosophic spirit: seeking truth modestly, humbly, diligently; piercing beneath the surface to gaze on the true nature of things; and not to be caught by sophistry, or misled by plausible representations. He has not the mathematical consecutiveness of Descartes, the speculative genius of Leibnitz, the sagacity of Locke, the <spirituel> of Berkeley, or the {193} detective skill of Hume; but he has a quality quite as valuable as any of these, even in philosophy; he has in perfection that common-sense which he so commends, and this saves him from the extreme positions into which these great men have been tempted by the soaring nature of their inexorable logic. It is genius, and not the want of it, that adulterates philosophy." He looks steadily and inquires carefully into the subjects of which he is treating; and if he does not go round them he acknowledges that he has not done so; and what he does see, he sees clearly and describes honestly. " The labyrinth may be too intricate, and the thread too fine to be traced through all its windings; but if we stop when we can trace it no farther, and secure the ground we have gained, there is no harm done, and a quicker eye may at times trace it farther." Speculative youths are apt to feel that, because he is so sober, and makes so little pretension, he cannot possibly be far-seeing or profound; but this is at the time of life when they have risen above taking a mother's counsel, and become wiser than their fathers; and, after following other and more showy lights for a time, they may at last be obliged to acknowledge that they have here the true light of the sun, which it is safer to follow than that of the flashing meteor. M. Cousin, in his preface to the last edition of his volume on the Scottish philosophy, declares that the true modern Socrates has not been Locke, but Reid. " Kant," he says, " has commenced the German philosophy, but he has not governed it. It early escaped him, to throw itself in very opposite directions. The name of Kant rests only on the ruins of his doctrines. Reid has impressed on the Scottish mind a movement less grand, but this movement has had no reactions." " Yes," he adds, " Reid is a man of genius, and of a true and powerful originality; so we said in 1819, and so we say in 1857, after having held long converse with mighty systems, discovered their secret, and taken their measure." There is profound truth in this; but it is scarcely correct to say that there have been no reactions against Reid in Scotland. There was a reaction by Brown

against his indiscriminate admission of first principles. Again, there is a reaction in the present day on the part of those who dislike his appeal to consciousness as revealing to us a certain amount of truth, and who deal, in consequence, solely with {194} historical sketches of philosophic systems, or who make the philosophy of the human mind a branch of physiology. Still Reid has continued to exercise a greater influence than any other metaphysician on the thought of his country. It is true, that in some respects he resembles Socrates; but in others he differs from him quite as much as the Scotch mind differs from the Greek. Both have very much the same truth-loving spirit, the same homely sense, and contempt for pretension: but Socrates has vastly more subtlety and dialectic skill, and reaches the conclusion that truth cannot be found except in moral subjects; whereas Reid firmly maintains and resolutely proclaims that settled truth can be attained by observation, in the kingdoms both of mind and matter. Reid's style will not please those who are seeking for flashes of genius, of wit or eloquence. But it always clearly expresses his ideas; and some prefer his plain statements, his familiar idioms, commonly purely English, to the stateliness of Stewart, -- who cannot express a commonplace thought except in a rounded period, -- and the perpetual rhetoric of Brown.

Thomas Reid was born, April 26, 1710, at Strachan, which is situated about twenty miles from Aberdeen, on the banks of a lively mountain stream, which rises on the high Grampians, and flows down the hollows of their northern slope into the Dee. The place is rather tame, and must have been bleak enough in winter; but it is quite a spot in which a thoughtful student might profitably pass the long summer vacations which the Scotch colleges allow, and have enjoyable rambles among the heath-clad and rocky mountains above him, including Clochnaben with the conspicuous stone on the top. His father, the Rev. Lewis Reid, was minister of the place for fifty years, and stood by the whig and reformation cause at the great crisis of the Revolution of 1688, when the people of that region, still under strong landlord influence, might have been readily swayed to the one side or the other. He was descended from a succession of Presbyterian ministers in Banchory-Ternan on the Dee, who traced their descent from an old county family, and go as far back as the Reformation. His mother was Margaret Gregory of Kinnairdie in Banffshire, and be longed to the family of that name, which was so illustrious in Scotland during the whole of last century and the beginning {195} of this. On both sides of his house were persons who had risen to eminence in literature and science. On his father's side, Dugald Stewart mentions Thomas Reid, who, on finishing his education at home, went to the continent, and maintained public discussions in several universities, and afterwards collected his theses in a volume; who published some Latin poems to be found in the " Delitim Poetarum Scotorum; " who became Secretary in the Greek and Latin tongues to James I., and, along with Patrick Young, translated the works of that monarch into Latin. A brother of his, Alexander Reid, was physician to King Charles I., and published several books on medicine; and another brother, Adam, translated into English Buchanan's " History of Scotland." On the side of the Gregorys the subject of our memoir could claim as grand-

uncle, James Gregory, the inventor of the reflecting telescope, and as uncles David Gregory, -- Savilian professor of astronomy at Oxford, and an intimate friend of Sir Isaac Newton's, -- and two others, professors of mathematics respectively at St. Andrews and Edinburgh. Such a kinsmanship must have given a powerful stimulus towards literature and science to a thoughtful youth like Thomas Reid.

The boy was two years at the parish school of Kincardine when the teacher foretold " that he would turn out to be a man of good and well-wearing parts." He was then sent to Aberdeen to prosecute his classical studies. He entered Marischal College, Aberdeen, in 1722, when he was only twelve years of age. He was in the first Greek class taught by Dr. Thomas Blackwell, afterwards principal, who took such pains to revive the study of the Greek tongue in the north of Scotland; and the pupil seems to have caught somewhat of the spirit of his master, for in after life he was known to recite in his class demonstrations of Euclid in the Greek language. But his special instructor was Dr. George Turnbull, who conducted him and other thirty-nine pupils through a three years' course in what was called philosophy.

He has left us in a letter written in 1779, an account of a curious youthful experience.

> "About the age of fourteen, I was almost every night, unhappy in my sleep, from frightful dreams -- . sometimes hanging over a dreadful hemisphere and just ready to drop down; sometimes pursued for my life and {196} stopped by a wall, or by a sudden loss of all strength; sometimes ready to be devoured by a wild beast. How long I was plagued with such dreams, I do not now recollect. I believe it was for a year or two at least; and I think they had quite left me before I was fifteen. In those days, I was much given to what Mr. Addison, in one of His "Spectators," calls castle building; and, in my evening solitary walk, which was generally all the exercise I took. my thoughts would hurry me into some active scene, where I generally acquitted myself much to my own satisfaction; and, in these scenes of imagination, I performed many a gallant exploit. At the same time, in my dreams, I found myself the most arrant coward that ever was. Not only my courage, but my strength, failed me in every danger; and I often rose from my bed in the morning in such a panic that it took some time to get the better of it. I wished very much to be free of these uneasy dreams, which not only made me unhappy in sleep, but often left a disagreeable impression in my mind, for some part of the following day. I thought it was worth trying whether it was possible to recollect that it was all a dream, and that I was in no real danger. I often went to sleep with my mind as strongly impressed as I could with this thought, that I never in my lifetime was in any real danger, and that every fright I had was a dream. After many fruitless endeavors to recollect this when the danger appeared, I effected it at last, and have often, when I was sliding over a precipice into

the abyss, recollected that it was all a dream, and boldly jumped down. The effect of this commonly was, that I immediately awoke. But I awoke calm and intrepid, which I thought a great acquisition. After this, my dreams were never very uneasy; and, in a short time, I dreamed not at all. During all this time I was in perfect health; but whether my ceasing to dream was the effect of the recollection above mentioned, or of any change in the habit of my body, which is usual about that period of life, I cannot tell. I think it may more probably be imputed to the last. How ever, the fact was that, for at least forty years after, I dreamed none, to the best of my remembrance; and, finding from the testimony of others that this is somewhat uncommon, I have often, as soon as I awoke, endeavored to recollect without being able to recollect any thing that passed in my sleep. For some years past, I can sometimes recollect some kind of dreaming thoughts, but so incoherent that I can make nothing of them. The only distinct dream I ever had since I was about sixteen, as far as I remember, was about two years ago. I had got my head blistered for a fall. A plaster, which was put on it after the blister, pained me excessively for a whole night. In the morning I slept a little, and dreamed very distinctly that I had fallen into the bands of a party of Indians, and was scalped. I am apt to think that as there is a state of sleep and a state wherein we are awake, so there is an intermediate state which partakes of the other two. If a man peremptorily resolves to rise at an early hour for some interesting purpose, he will of himself awake at that hour. A sick-nurse gets the habit of sleeping in such a manner that she bears the least Whisper of the sick person, and yet is refreshed by this kind of half sleep. The same is the case of a nurse who sleeps with a child in her arms. I have slept on horseback, but so as to preserve my balance; and, if the horse stumbled, I {197} could make the exertion necessary for saving me from a fall, as if I was awake. I hope the sciences at your good university are not in this state. Yet, from so many learned men so much at their ease, one would expect something more than we hear of."

He graduated in 1726 at the age of sixteen. His college life was prolonged by his being appointed librarian to the university, which office he continued to hold till 1736. Ever a student, and busied with solid work, he joined eagerly with his friend John Stewart, afterwards professor in Marischal College, in pursuing mathematical studies, specially the " Principia " of Newton. His life was varied by his taking with his friend Stewart an excursion into England, and visiting London, Oxford, and Cambridge. Through his relative David Gregory he got access to the house of Martin Folkes, where he met with " the most interesting objects which the metropolis had to offer to his curiosity. At Cambridge he saw Dr. Bentley, -- who delighted him with his learning and amused him with his vanity,-and enjoyed repeatedly the conversation of the blind mathematician Saunderson, a phenomenon in the history of the human mind to which he has referred more than once in his philosophical speculations."

In 1737, he was presented by King's College, Aberdeen, to the living of New Machar, -- a country parish about a dozen miles from Aberdeen, lying on the level agricultural land of the county, but with glorious views of the distant mountains towards the west. The circumstances connected with his settlement furnish a vivid picture of the age. By this time there was a keen antagonism between the Evangelical and the Moderate parties in the Church of Scotland and this was fiercely manifested on this occasion. In order to his being settled, the probationer or minister had not only to receive a presentation from the patron, but a "call " from the people, which, however, was by this time becoming a mere form, as the ecclesiastical courts falling under the influence of the patronage spirit contrived to avoid insisting on a <bona fide> concurrence from the members of the congregation. We have preserved "A Sermon preached before the Reverend the Presbytery of Aberdeen in the Church of New Machar, Feb. 10, 1737, at the Moderation of a Call to a Minister for that vacant Church, by Mr. John Bisset, Minister of the Gospel at Aberdeen." Mr. Bisset had {198} formerly been minister of New Machar, and was known all over the north as a popular preacher, a defender of evangelical religion, and an opponent of patronage. In this discourse, which is full of stirring appeals, he warns the people against the fear of man which bringeth a snare," against being intimidated by their landlords, and acting on the slavish principle, 'I am for the man the laird is for." Expressing his affection for a people to whom he had been minister for twelve years, he reminds them that when he left them their landlords had persuaded them to take a minister who had fallen into fornication and absconded. He complains of persons not residing in the parish, or though residing in it not attending gospel ordinances, interfering to serve a friend, referring, it is supposed, to a near relative of Dr. Reid's. He asserts that the election of a minister is a Christian right, and that " the poor Christian in vile raiment may claim the same regard that is paid to him who wears the gay clothing, the gold ring and the goodly apparel." It is a poor and worthless story for any man to say, that you, the people, are tenants at will, and to improve this as if you were to have no will but theirs in the work of this day. Well may you reply that you are tenants at God's will, who can take them away with His stroke when they are thinking to have their wills of you. He exhorts them to trust in God and do what is right, and warns them that, even though they should by acting an unconscientious part secure an earthly habitation, yet they might soon be driven out of it." The appeal produced a powerful effect. The people, having no hope of getting their rights protected by the church courts, adopted a mode of expressing their feelings characteristic of the times. The tradition is that, when their minister came to the place, men dressed in women's clothes, ducked him in a pond; and that, on the sabbath on which he preached his first sermon, an uncle of his who resided at Rosehill, two miles off, defended him on the pulpit stair with a drawn sword.

I am not sure that the sphere to which Reid was now appointed was the one exactly suited to him, or that he was the fittest man to preach the gospel of Christ to a country

congregation, or indeed that the old Scotch theory of connecting the church and the colleges so closely was the best either for the church or the colleges. For the first seven years he was in {199} the way of preaching the sermons of others, a practice very obnoxious to the people. The tradition is that on one occasion when at Fintray, three miles off, the lady of Sir -- Forbes thanked him for preaching on the previous sabbath so excel lent a sermon from Tillotson; whereupon he denied in strong terms that he had taken a sermon from Tillotson. To his confusion he found, on retiring to his bedroom, a volume of Tillotson's on his table, lying open at the place where was the discourse he had preached. Ashamed, not of the fact of his preaching another man's sermons, but of his being supposed capable of uttering a falsehood, he hastened to inform the lady that he had taken the discourse not from Tillotson's published sermons, but from a packet which he had otherwise.[54]

But while thus obnoxious at his first settlement, he is said to have gradually won the good opinion of his parishioners by the propriety of his conduct, his conscientiousness, and his kindness. His popularity was increased when, in 1740, he married Elizabeth, -- the daughter of his uncle Dr. George Reid, physician in London, -- who endeared herself to the people by her kind offices to the sick and poor. There is reason to believe that in the later years of his ministry he became earnest in his Master's service. The tradition is that, in dispensing the sacrament of the supper, tears rolled from his eyes, when he spoke of the loveliness of the Saviour's character. The following dedication of himself to God is preserved in the manuscripts,[55] and lets us see more clearly than any thing that has been printed by Dugald Stewart the deep feeling that lay beneath that calm outward demeanor. It is dated March 30, 1746.

> " O God: I desire humbly to supplicate thy Divine Majesty in behalf of my distressed wife, who is by thy hand brought very low, and in imminent danger of death, if thou, who alone dost wonders, do not in mercy interpose thy Almighty arm, and bring her back from the gates of death. I deserve justly, O Lord, that thou shouldst deprive me of the greatest comfort of my life, because I have not been so thankful to thee as I ought for giving me such a kind and affectionate wife. I have forgot thy goodness in bringing us happy together by an unforeseen and undesigned train of events, and blessing us with so much love and harmony of affections and so many of the {200} comforts and conveniences of life. I have not been so careful as I ought to have been to stir her up to piety and Christian virtues. I have not taken that pains with my children and servants and relatives as I ought. Alas ! I have been too negligent of my pastoral duty in my private devotions, too much given to the pleasures and satisfactions of this world, and too little influenced by thy promises and the hopes of a future state. I have employed my studies, reading, and conversation, rather to please myself than to edify myself and others. I have sinned greatly in neglecting

many opportunities of making private applications to my flock and family in the affairs of their souls, and in using too slight preparation for my public exercises. I have thrown away too much of my time in sloth and sleep, and have not done so much for the relief of the poor and destitute as I might Dave done. The means that Providence has afforded me of correcting any evil inclinations I have abused to panper and feed them, n various instances. For these and many other sins which have escaped my memory, thou mightst justly inflict so great a chastisement upon me, as to make my children motherless, and deprive me of my dear wife. O Lord, for thy mercy's sake, accept of my humble and penitent confession of these my offences, which I desire to ac knowledge with shame and sorrow, and am resolved by thy grace to amend. If thou art pleased to Hearken to the voice of my supplications, and grant my request in behalf of my dear wife in restoring her to health, I do promise and covenant through grace to turn from these backslidings, to express my thankfulness by a vigorous discharge of my duty as a Christian, a minister, and master of a family; and by an alms of ten pounds sterling to the poor, in meal and money. Lord, pardon, if there is any thing in this over presumptuous, or unbecoming a humble, penitent sinner; and, Lord, accept of what is sincerely designed as a new bond upon my soul to my duty, through Jesus Christ, my Lord and Saviour."

Stewart tells us that, " during his residence at New Machar, the greater part of his time was spent in the most intense study; more particularly in a careful examination of the laws of external perception, and of the other principles which form the groundwork of human knowledge. His chief relaxations were gardening and botany, to both of which pursuits he retained his attachment in old age." It was while he was minister, and at the mature age of thirty-eight, that he published in the " Transactions of the Royal Society of London," " An Essay on Quantity, occasioned by reading a Treatise in which Simple and Compound Ratios are applied to Virtue and Merit." Francis Hutcheson had spoken of the benevolence of an agent which with him constitutes virtue-as "proportional to a fraction, having the moment of good for the numerator and the ability of the agent for denominator." I suspect that he meant this to be little more than an illustration, and did not seriously propose {201} to apply mathematical demonstration to moral subjects. But Pitcairn and Cheyne had been applying mathematical reasoning to medicine; and Reid thought it of importance to show what it is that renders a subject susceptible of mathematical demonstration. It is interesting to notice that the first publications both of Reid and Kant had a relation to mathematical subjects. But it was the publication of Hume's " Treatise of Human Nature" that first directed his intellectual abilities to independent philosophic research. In his " Essays on the Intellectual Powers," published in 1785, he says, " having long believed the prevailing doctrine of ideas, it came into my mind more than forty years ago to put the question, What evidence have I for this doctrine, that all the objects of my knowledge are ideas of

my own mind? From that time to the present, I have been candidly and impartially, as I think, seeking for the evidence of this principle; but can find none, excepting the authority of philosophers." It is clear that the professors of King's College put one so employed in the fitting place, when, in 1752, they elected him professor of philosophy.

" Immediately on Dr. Reid's appointment to the place of one of the regents of King's College, he prevailed on his colleagues to make great improvements in their system of university education. The session was extended from five to seven months; a humanity class was added, on a higher scale than had been taught previously; and the teaching of the elements of Latin, by the professor of humanity, discontinued; some of the small bursaries were united, and an account of these alterations was given to the public, in 1754. Dr. Reid was in favor of one professor teaching the whole or the greater part of the curriculum, and therefore did not follow the plan of confining the professors to separate branches, as had been done in Glasgow since 1727, and at Marischal College since 1723. The plan of a seven-months' session, after a trial of five years, was abandoned." [56] In Aberdeen he was surrounded by an able body of colleagues in the two universities, by not a few thoughtful and accomplished men, ministers and professional men of the town and neighborhood and he had under him a succession {202} of shrewd students, whom he conducted, in a series of years, through all the higher branches. He managed to bring together the literary and scientific men by means of the famous "Aberdeen Philosophical Society," which he was the main instrument in founding, and which helped to call forth and combine what may be called the Aberdeen branch of the Scottish philosophy. To that society he contributed a series of papers containing most of the views which were afterwards embodied in the work which established his reputation, "An Inquiry into the Human Mind on the Principles of Common Sense." That work was published in 1764.

In the end of 1763, he was invited by the University of Glasgow to the professorship of moral philosophy there, and entered upon his duties the following year. In this new sphere he confined his instructions to the intellectual and active powers of man, and unfolded a system of ethics comprising some general views with respect to natural jurisprudence and the fundamental principles of politics; he delivered, besides, a few lectures on rhetoric to an advanced class. We have here a sketch of him by his most distinguished pupil and biographer: " In his elocution and mode of instruction there was nothing peculiarly attractive. He seldom, if ever, indulged himself in the warmth of extempore discourse; nor was his manner of reading calculated to increase the effect of what he had committed to writing. Such, however, was the simplicity and perspicuity of his style, such the gravity and authority of his character, and such the general interest of his young hearers in the doctrines which he taught, that, by the numerous audiences to which his instructions were addressed, he was heard, uniformly, with the most silent and respectful attention. On this subject I speak from personal knowledge, having had the good fortune during a considerable part of

the winter of 1772 to be one of his pupils."

We have preserved letters [57] of his to his old Aberdeen friends, Dr. Andrew Skene and Dr. David Skene, which give us glimpses of the Glasgow college life of the period. -- " Glasgow, Nov. 14, 1764. I must launch forth in the morning so as to be at the college (which is a walk of eight minutes), half an hour after seven o'clock, when I speak for an hour, without interruption, {203} to an audience of about a hundred. At eleven, I examine for an hour upon my morning prelection, but my audience is little more than a third part of what it was in the morning. In a week or two, for three days of the week, I have a second prelection at twelve, upon a different subject, when my audience will be made up of those who hear me in the morning, but do not attend at eleven. My hearers attend my class two years at least. The first session they attend the morning prelection and the time of examination at eleven; the second and subsequent years they attend the two prelections, but not the hour of examination. They pay fees for the first two years; and then they are caves of that class, and may attend gratis as many years as they please. Many attend the moral philosophy class four or five years, so that I have many preachers and students of divinity and law of considerable standing, before whom I stand in awe to speak without more preparation than I have leisure for. I have great inclination to attend some of the professors here, several of whom are very eminent in their way, but I cannot find much leisure. Much time is consumed in our college in business meetings, of which we have, commonly, four or five in the week. We have a literary society once a week, consisting of the masters and two or three more, where each of the members has a discourse once in the session. The professors of humanity, Greek, logic, and natural philosophy, have as many as I have, some of them more. All the other professors, except one, teach at least one hour a day, and we are no less than fourteen in number. The hours of the different professors are different, so far as can be, that the same student may attend two or three, or perhaps more, at the same time. Near a third part of our students are Irish. Thirty came over lately in one ship, besides those that went to Edinburgh. We have a good many English, and some foreigners. Many of the Irish, as well as Scotch, are poor and came up late to save money, so that we are not fully convened, though I have been teaching ever since the 10th of October. Those who pretend to know say that the number of students this year, when fully convened, will amount to 300. The masters live in good habits with one another, and manage their political differences with good manners, although with a good deal of intrigue and secret caballing when there is an election." {204}

A year after we have another picture of his collegiate position. "Our college is considerably more crowded than it was last session. My class indeed is much the same as last year, but all the rest are better. I believe the number of our students of one kind or other may be between four and five hundred. But the College of Edinburgh is increased this year much more than we are. The professor, Ferguson, is indeed as far as I can judge a man of noble spirit, of very elegant manners, and has a very uncommon flow of eloquence.

I hear he is about to publish, I do not know under what title, a natural history of man, exhibiting a view of him in the savage state, and in the several successive states of pasturage, agriculture, and commerce." " The most disagreeable thing in the teaching part is to have a great number of stupid Irish teagues who attend classes for two or three years, to qualify them for teaching schools or being dissenting teachers. I preach to these as St. Thomas did to the fishes. I do not know what pleasure he had in his audience; but I should have none in mine if there was not in it a mixture of reasonable creatures. I confess I think there is a smaller portion of these in my class this year than there was the last, although the number on the whole was not less. I have long been of opinion that in a right constituted college there ought to be two professors for each class, one for the dunces, and another for those who have parts. The province of the former would not be the most agreeable; but perhaps it would require the greatest talents, and therefore ought to be accounted the post of honor. There is no part of my time more disagreeably spent than that which is spent in college meetings, of which we have often five or six a week." "These meetings are become more disagreeable by an evil spirit of party, that seems to put us in a ferment; and I am afraid will produce bad consequences." We have here glimpses of the evils arising from the college patronage being so largely vested in a limited self-elected body, who turned it to party and family ends. As to the roughness of the Irish <teagues> (colts) which seems partly to have amused, and partly to have alarmed him, the blame of it is partly to be charged on the college itself, which received these students too eagerly, and allowed them to graduate too easily after a shorter period of attendance than the Scottish youths. The Presbyterian youth of {205} Ulster-shut out from Dublin University, owing to its sectarian character -- received from Glasgow, if not a refined, a very useful education, which enabled them, as ministers, doctors, and teachers, to raise their province above the other districts of Ireland in industry and intelligence.

As it is interesting to notice the Aberdeen philosopher's view of the frolicsome Irish youth, so it is instructive to observe the estimate by the Aberdeen moderate of the Calvinistic religion of the land of the covenant. Writing to Aberdeen, July 13, 1765: ,I think the common people here and in the neighborhood, greatly inferior to the common people with you. They are Boeotian in their understandings, fanatic in their religion, and clownish in their dress and manners. The clergy encourage this fanaticism too much, and find it the only way to popularity. I often hear a gospel here which you know nothing about; for you neither hear it from the pulpit nor will you find it in the Bible." Possibly this gospel was the very gospel of grace so valued by the people of the west of Scotland. It is possible, too, that at this time, when the contest between the refined moral system and the evangelical system was the closest and keenest, Dr. Reid may have been kept at a distance from the latter. In another letter he sees some of the more favorable features of the western character. " The common people have a gloom in their countenance which I am at a loss whether to ascribe to their religion or to the air

and climate. There is certainly more of religion among the common people in this town than in Aberdeen, and although it has a gloomy enthusiastic cast, yet I think it makes them tame and sober. I have not heard either of a house or head broke, of a pocket pict [picked], or of any flagrant crime, since I came here. I have not heard any swearing in the streets, nor seen a man drunk (excepting, <inter nos>, one prof -- r), since I came here." The Aberdeen moderate is not prepossessed in favor of the west-country religion, but testifies in behalf of the west-country morality. He has an idea that the morality may somehow be connected with the religion; and possibly he might have seen more amiability and cheerfulness in the piety of the common people had he come in closer contact with it. It is significant that the drunk man is to be found in the class which had risen above the national faith. We shall have to look at a very {206} different picture half a century later, when Chalmers begins his moderate <regime> labors in Glasgow. By that time, under the regime, both morality and religion have disappeared from the region (Drygate) in which Reid lived. The Glasgow professors may not have been directly responsible for the growing wickedness; but there was nothing in their teaching, moral or theological, adequate to the task of purifying the pollution coagulating all around them.

There are indications in these letters of the interest taken by Reid in every sort of scientific pursuit. He confidentially reports to Dr. David Skene Dr. Black's theory of heat before it was made known to the world. He is aiding a Turin professor of medicine who comes to Glasgow in his inquiries about the petrifaction of stones. He sends philosophical instruments to his friends in Aberdeen (Feb. 25, 1767). " For my part, if I could find a machine as proper for analyzing ideas, moral sentiments, and other materials belonging to the Fourth Kingdom, I believe I should find in my heart to bestow the money for it. I have the more use for a machine of this kind, because my alembic for performing these operations -- I mean my cranium-has been a little out of order this winter by vertigo, which has made my studies go on heavily, though it has not hitherto interrupted my teaching."

Thus flowed along, quietly and honorably, the remaining days of Dr. Reid. He corresponded with Lord Kames and Dr. James Gregory on such subjects as liberty, cause, motives, and volition. The letters have been published. Many of them are controversial, but they are conducted in an admirable spirit. He wrote a number of papers of some value, apparently for the literary society of Glasgow. In particular, be has " Some Observations on the Modern System of Materialism," meaning by Materialism that advanced by Dr. Priestley in his " Disquisitions relating to Matter and Spirit" (1777), and "A free Discussion of the Doctrines of Materialism and Philosophical Necessity" (1777). This paper appears in no fewer than five forms, showing what pain she had taken with it. One or two of the forms look like mere notes or preparations, the other three are fully written out. It is of a thorough and searching character, distinguished for acuteness beyond almost any of his published writings, and written with great point and <naivete>. He {207} also wrote " Miscellaneous Reflections

on Priestley's Account of Hartley's "Theory of the Human Mind." He speaks with great fondness and respect of Hartley, but shows that his doctrines were unfounded hypotheses. He is severe upon Priestley's application of Hartley's theories, and examines the attempt to explain the memory, and the mental faculties generally, and the passions and volitions, by association.[58] But the principal work of his declining life consisted in writing his " Essays on the Intellectual Powers of Man," published in 1785, and the " Essays on the Active Powers," which appeared in 1788.

Underneath the calm, unpretentious demeanor, there was a deep fountain of devout feeling ready to burst out on certain occasions. Again we are told that, in dispensing the sacrament of the Lord's supper, he could not refer to the love of Christ without tears running down his eyes.[59] In the autumn Of 1796, he had repeated strokes of palsy, and he died Oct. 7th. His daughter Mrs. Carmichael writes: " His piety and resignation never forsook him in times of deepest affliction, and in all his distress during his last illness. Such is the blessed effect of the power of religion, and of a conscience void of offence towards God and man."[60]

Turning now to the philosophy of Reid, we find it distinguished throughout by independence of thought and a love of truth. He admires the genius of those who were rulers in the world of speculation in his time, but he does not follow them. He might have been inclined to do so, but he was staggered by the consequences which had been drawn by Hume; and this led him to review the philosophy that prevailed in his time, and which claimed as its authors the illustrious names of Descartes, Locke, and Berkeley. The consequence is, that his works, though expository throughout, have all along a polemical front, but always bearing a calm, a polite, and benignant aspect. We cannot understand his philosophy, and we cannot appreciate his originality, unless we bear this circumstance in mind, which, I may add, we are not likely to forget, as he is constantly referring to some one or other of these authors. He claims {208} credit in regard to two points, gone in examining and under mining the ideal theory of sense-perception, the other in establishing the doctrine of common sense. These are the topics on which I mean chiefly to dwell in the exposition and criticism of his two works.

His "Inquiry" is occupied almost exclusively with the senses. It is one of the excellencies of his philosophy as compared with those that have gone before, and most of those that have appeared since his time, that he so carefully inquired into these original inlets of knowledge. In doing so, he shows that be is acquainted with all that had been done in physiology down to his time, and that he had been in the way of making original observations. He goes over the senses one by one, beginning with the simpler, smelling and tasting; and going on to the more complex, hearing, touch, and seeing. Under smelling he announces a number of general principles applicable to all the senses, as in regard to sensation considered absolutely, and the nature of judgment and belief. Under hearing he speaks of natural language; and under touch, of natural signs and primary qualities. He dilates at greatest length on sight: discussing such topics

as color, visible figure, extension, the parallel motion of the eyes, squinting, and Berkeley's theory of vision. He treats them physiologically, so far as physiology could then carry him; but he treats them also, which so many later German and British psychologists do not, in the light of the revelations of consciousness. He takes up the same subject in the earlier parts of his " Essays."

" All philosophers, from Plato to Hume, agree in this that we do not perceive external objects immediately, and that the immediate object of perception must be some image present to the mind." He shows that no solid proof has been advanced of the existence of the ideas; that they are a mere fiction and hypothesis, contrived to solve the phenomena of the human understanding; that they do not at all answer this end; and that this hypothesis of ideas or images of things, in the mind or in the sensorium, is the parent of foolish paradoxes.

Let us try to determine precisely his doctrine as to perception by the senses. Negatively: he denies, first, that we perceive by means of ideas, in the mind or out of it, coming between the mind and the material object perceived; secondly, that we {209} reach a knowledge of the external object by means of reasoning; and, thirdly, that, in order to the conception of any thing it is necessary to have some impression or idea in our minds which resembles it, particularly setting himself against the doctrine of Locke, that Our ideas of the primary qualities are resemblances of them. What he advances on these points seems to me clear, full, and satisfactory. He has done special service to philosophy by removing these confusing and trouble some intermediaries which were called <ideas>. It may be that the great body of philosophers had not drawn out for their own use such a doctrine of ideas as Reid exposes; it may be that some of them, if the question had been put to them, would have denied that they held any such doctrine; it may be, as Hamilton has tried to show, that some few held a doctrine of perception without ideas: but I believe that Reid was right in holding that mental philosophers generally did bring in an idea between the mind perceiving and the external object; that some objectified the internal thought, and confounded it with the object perceived that others created an image in the mind or in the brain and that some had not clearly settled what they meant by the term they employed. I believe he is right when he says generally, that " ideas being supposed to be a shadowy kind of beings, intermediate between the thought and the object of thought, sometimes seem to coalesce with the thought, sometimes with the object of thought, and sometimes to have a distinct existence of their own." I am sure that the discussion in which he engaged has been of great utility in compelling those philosophers who still use the word "idea" to tell us what they mean by it, and of still greater utility in leading so many to abandon the use of the phrase altogether in strictly philosophic investigations.

I am not to enter deeply into the interminable discussions as to the sense in which the word "idea" has been used by Descartes and Locke. Hamilton says that by the phrase Descartes " designated two very different things;

viz., the proximate bodily antecedent and the mental consequence." ("Works," p. 273.) As to the meaning which Locke attached to the term, I must content myself with referring to the discussions of Stewart, Brown, and Hamilton. After reading these with care, I am convinced that the following observations of Reid are as just as {210} they are important: " Perhaps it was unfortunate for Mr. Locke that he used the word idea so very frequently as to make it very difficult to give the attention necessary to put it always to the same meaning. And it appears evident that, in many places, be means nothing more by it but the notion or conception we have of any object of thought; that is, the act of the mind in conceiving it, and not the object conceived." But then he frequently uses it to signify " the images of external things in the mind." " There is a third sense in which he uses the word not unfrequently,-to signify objects of thought that are not in the mind, but external." " Thus we see that the word idea has three different meanings in the `Essay;' and the author seems to have used it sometimes in one, sometimes in another, without being aware of any change in the meaning. The reader slides easily into the same fallacy, that meaning occurring most readily to his mind which gives the best sense to what he reads." It is specially true of Locke what Reid affirms generally: "The way in which philosophers speak of ideas seems to imply that they are the only objects of perception " (P. 263).

The service which Reid has done to philosophy by banishing these intermediaries between perception and its external object cannot be over-estimated. He has also been successful in proving that it cannot be by a process of reasoning that we reach the conception of, and belief in, the existence of body. There is nothing in any organic affection of the nerves or brain, nothing in the sensation in the mind, to entitle us to believe in an extended resisting object. He also deserves great credit for showing so clearly that the conceptions of the qualities of matter are not to be supposed to have a resemblance to the qualities themselves. Locke acknowledges as to the secondary qualities of matter that the ideas are not to be regarded as being like them; but he still talked of ideas of the primary qualities as being resemblances. This may have been little else than loose language on the part of Locke, to indicate that there was a correspondence or relation of some kind; but it was desirable to correct it, as it was fitted to convey a very erroneous impression. In a later age, Hamilton exposed thoroughly the more general error, that like can only influence like, and that like can only be known by like. It is disheartening to think how much of the energy of our greatest thinkers has {211}been spent in correcting errors which other great thinkers have introduced. It looks as if it were only by a continued struggle that truth is to gain a victory over error.

He has not been so Successful in establishing a doctrine of his own as in opposing the errors of others. But his view of perception, whether we approve of it or not, can be understood by us. He maintains that there is first a sensation in the mind, and that this sensation suggests a perception. The word <suggestion> to denote the rise of a thought in the mind, was employed by earlier philosophers,

but was adopted by Reid from Berkeley, who again took it from Locke. Reid maintains that there are natural suggestions; particularly that sensation suggests the notion of present existence, and the belief that what we perceive or feel does now exist; that memory suggests the notion of past existence, and the belief that what we remember did exist in time past; and that our sensations and thoughts do also suggest the notion of a mind, and the belief of its existence and of its relation to our thoughts. By a like natural principle it is, that a beginning of existence, or any change in nature, suggests to us the notion of a cause and compels our belief in its existence.... And, in like manner, certain sensations of touch, by the constitution of our nature, suggest to us extension, solidity, and motion." (" Works," p.111.) Closely connected or rather identical with this theory of suggestion is his doctrine of natural language and signs, -- a phraseology also taken from Berkeley. He maintains that there are natural signs, " which, though we never had any notion or conception of the thing signified, do suggest it, or conjure it up, as it were by a natural kind of magic, and at once give us a conception and create a belief in it." He calls " our sensations signs of external objects." The operations are represented by him as " simple and original, and therefore inexplicable, acts of the mind."

The whole account seems to me unsatisfactory, nearly as much so as the ideal hypothesis. There is no evidence that sensation comes before perception. The two are thus distinguished by Reid: " When I smell a rose, there is in this operation both sensation and perception. The agreeable odor I feel, considered by itself, without relation to any external object, is merely a sensation." The quality in the rose which {212} produces the sensation "is the object perceived, and that act of my mind by which I have the conviction and belief of this quality is what I call perception." (310.) These two seem to me to constitute one concrete act, and they can be separated only by a process of abstraction. There is not first a sensation of a colored surface, and then a perception of it; but we have the two at once. This does away with the necessity of signs and suggestions, which might be quite as troublesome intermediaries as ideas. It would be better to say that, upon certain affections of sense being conveyed to the mind, it <knows> (this is a better phrase than <conceive>, or than <believe in> at once the colored surface.

Hamilton, when he began to edit Reid, thought that Reid's doctrine was the same as his own. But, as he advances, he sees that it is not so; and he comes to doubt whether, after all, Reid held the doctrine to which he himself adhered so tenaciously, that of immediate perception. Reid does, indeed, represent perception as immediate; meaning that it is direct, and with out a process of reasoning. Yet he tells us that, " although there is no reasoning in perception, yet there are certain means and instruments, which, by the appointment of nature, must intervene between the, object and our perception of it; and by these our perceptions are limited and regulated." Surely Hamilton himself will admit that there are such means in the action of the senses, of the nerves, and the brain, without

which there can be no perception. Reid indeed calls in more of such anterior processes than Hamilton does; in particular, he calls in signs and suggestions, and makes sensation come before perception. But, after all, the two agree in the main point. While both allow, as all men do, that there are processes prior to the perception, both agree that when the mind is perceiving, it is perceiving not an idea, or even a sensation or suggestion, but an external extended object.

On one point, however, and this not an unimportant one, Reid and his commentator do differ; and that is as to what should be represented as the object of perception. Locke means by idea, " whatever is the object of the understanding when it thinks." But the word <object>, in such a connection, may be as ambiguous as <idea>. Reid speaks of the stars as the objects before the mind when we look into the heavens. Hamilton {213} says that the object is the rays of light reaching the eye. He maintains that in perception the proper object is not a distant one, but is either the organism or the objects in contact with the organism. Physiological research seems to show that in this respect Hamilton is right. But still it is true that, whatever be the immediate object, the distant star, and not the rays of light, does become, always by an easy process of observation and inference, the main object contemplated. The two are agreed that the object is an external extended one; is, in short, a natural object, and not an idea in the mind, or a modification of the mind.

Let us attend a little more carefully to the view which he gives of perception proper. " If, therefore, we attend to that act of our mind which we call the perception of an external object, we shall find in it these three things: First, some conception or notion of the object perceived; secondly, a strong and irresistible conviction and belief of its present existence; thirdly, that this conviction and belief are immediate, and not the effect of reasoning." (" Works," P. 258.) The two first of these he discovers by an analysis of the concrete act. They are not happily expressed. The better statement is, that in perception we know at once the object; and this knowledge embraces what he calls the " notion " or " conception," -- phrases which should be reserved for the abstract and general notions which are formed by a subsequent discursive process, -- and also what he calls the conviction and belief, which latter phrase should be confined, I think, to the conviction which we have of objects not now present, to objects of faith as distinguished from objects of sight or sense generally. By giving this account we are saved from being obliged to represent such ideas as extension as concomitants of our perceptions. The correct statement is that, by sight and touch, -- I believe by all the senses, we know objects as extended -- , and we can then separate, by abstraction, the extension from the other parts of our concrete cognition, and can also inquire what intuitive convictions are involved in it. Hamilton, venturing " a step beyond Reid and Stewart, no less than Kant " has fallen into the awkwardness of calling in both an <a priori> conception with Kant, and an <a posteriori> perception with Reid. (P. 126.) Our cognition of extension is just one experience, but involves certain

intuitive convictions. {214}

Reid, like Locke, draws the distinction between the primary and secondary qualities of matter; but he grounds it on a different principle. According to Locke, primary qualities are " such as are utterly inseparable from the body in what state soever it be." (" Essay" II., 8.) According to Reid, , the distinction is this, that our senses give us a direct and a distinct notion of the primary qualities, and inform us what they are in themselves. But of the secondary our senses give us only a relative and obscure notion. They inform us only that they are qualities that affect us in a certain manner; that is, produce in us a certain sensation: but, as to what they are in themselves, our senses leave us in the dark." He says more expressly: " Of some things, we know what they are in themselves: our conceptions of such things I call <direct>. Of other things, we know not what they are in themselves, but only that they have certain properties or attributes, or certain relations to other things: of these our conception is only <relative>." (P. 513.) Hamilton remarks that "by the expression, 'what they are in themselves,' in reference to the primary qualities, and of `relative notion' in reference to the secondary, Reid cannot mean that the former are known to us <absolutely and in themselves>; that is, <out of relation> to our cognitive faculties." (PP. 313, 314.) Certainly Reid was not dealing with such ideas as the absolute, and things " out of relation to our faculties: " these are phrases and distinctions belonging to a very different philosophy. He means that, when we look on a material object, we are led to believe it to be extended; whereas, when we experience the sensation of heat, we simply know that there must be an external object causing it, without knowing what it is. When physical science shall have thrown farther light on the qualities of bodies, I should like to have the distinction between the primary and secondary qualities of bodies reviewed by a competent philosopher. For the present, the distinction, as drawn by Reid, seems to me to be upon the whole the best: " The notion we have of primary qualities is direct, and not relative only." Hamilton might have done well, in reference to his own theory of relativity, to ponder the statement of Reid: " A relative notion of a thing is, strictly speaking, no notion of the thing at all, but only of some relation which it bears to something else." {215}

The substance of the "Essays on the Intellectual Powers of Man," was delivered annually, for more than twenty years, in lectures to his class in the University of Glasgow, and for several years before in Aberdeen. He commences with such topics as the explication of words, principles taken for granted, analogy, the proper means of knowing the operations of the mind, the difficulty of attending to the operations of the mind, on all of which he has remarks characterized by much sound sense and fitted to be eminently useful to those entering on the study of the human mind. He closes Essay 1. with a classification of the mental powers: (1) The powers we have by means of our external senses; (2) Memory; (3) Conception; (4) The power of resolving and analyzing complex objects, and compounding those that are simple; (5) judging; (6) Reasoning; (7) Taste; (8) Moral perception; and, last of

all, consciousness. may offer a few remarks on each of these.

<Perception>. After the full discussion in which we have been engaged in reviewing his " Inquiry," it is not needful to dwell on this subject. A large portion of Essay II. is occupied with a review of the " sentiments of philosophers about the perception of external objects," such as the Peripatetics, Malebranche, Descartes, Locke, Berkeley, Hume, Arnauld, and Leibnitz. His account of the opinions of these men is marked by great conscientiousness and candor: it is generally clear, often searching, always characterized by plain sense, at times superficial and mistaken. Hamilton has shown that Reid has fallen into gross blunders from not having mastered, as a whole, the higher speculative systems, such as those of Aristotle, Descartes, and Leibnitz. Hamilton's notes should always be read with Reid's exposition. These notes are as valuable for their logical acumen and erudition, as the text is for its independence and its homely sense.

<Memory>. His analysis of this power, which will be found to contain such elements as retention, phantasy, association, and recognition, is not at all searching. But he is successful in showing that it is an original faculty, and he has a number of useful, though somewhat superficial, remarks upon its mode of operation. He describes memory as giving us an immediate knowledge of things past, which leads to a very severe criticism by Hamilton, who remarks that an immediate knowledge {216} of things past is a contradiction. But Reid does not use the word `immediate' in the same rigid sense as Hamilton: all that he means is that, in our recognition of the past, there is no reasoning or any other discursive process. Hamilton is right when he says that the immediate object before the mind is a phantasm or representation in the mind; but it is also true that in memory we go intuitively, beyond the representation in the mind, to the past occurrence which it represents. Reid says that "our notion of duration, as well as our belief in it, is got by the faculty of memory." Whereon Hamilton remarks that this is to make " time an empirical or generalized notion," and then tells us that time is a necessary notion, arising on the occasion of experience. But Reid's doctrine is the more correct of the two. In every act of memory we have the remembrance of an event in time past, and have thus the idea of time in the concrete, and get the idea of time in the abstract by separating the time from the event; and upon reflection we discover that there are necessary convictions involved in our belief in time. Reid's account of the idea of time, though not exhaustive, is thus correct so far as it goes. By not calling in a faculty of recognition, Hamilton has not been able to show how we get the idea of time, and has been obliged with Kant to make it some sort of <a priori> form.

<Conception>. Under this phrase he includes three things. They are either the conceptions of individual things, the creatures of God; or they are conceptions of the meaning of general words; or they are the creatures of our own imagination." He has sensible remarks as to each of these, but not a good nomenclature to indicate the

distinctions. It is in this essay that he treats of the train of thought in the mind, which he does in a superficial manner, compared even with his predecessors Turnbull and Hutcheson.

<Abstraction>. He does not distinguish so carefully as he should have done between the abstract and general notion. He has a glimpse of the distinction between the comprehension and extension of a general conception. " The species comprehends all that is in the genus, and those attributes, likewise, which distinguish that species from others belonging to the same genus, and, the more subdivisions we make, the names of the lower become still the more comprehensive in their signification, {217} but the less extensive in their application to individuals." (P. 391.) In regard to the subjects discussed by the nominalists, realists, and conceptualists, he is a moderate conceptualist, dwelling fondly on the necessity of observing the points of resemblance in the objects placed in the group. He has some good remarks on the formation of general notions, but does not discover -- what is, after all, the essential point-the putting together in the class all the objects possessing the common attribute, or attributes, fixed on. His realistic tendency is seen in the remark: "When I speak of general notions, or general conceptions, I always mean things conceived, and not the act of the mind in conceiving them." (P. 404.)

<Judgment>. Under this head we are introduced to the full discussion of his favorite subject, common sense, which he says means common judgment. " We ascribe to reason two offices, or two degrees. The first is to judge of things self-evident the second, to draw conclusions which are not self-evident from those that are. The first of these is the province and the sole province of common sense; and therefore it coincides with reason in its whole extent, and is only another name for one branch or degree of reason." (P. 425.) He divides the principles of common sense into two classes: -- as they are contingent; or as they are necessary and immutable, whose contrary is impossible.

I. P/RINCIPLES OF\ C/OMMON\ S/ENSE RELATING TO\ C/ONTINGENT\ T/RUTH\.

1. The existence of every thing of which I am conscious.
2. The thoughts of which I am conscious are the thoughts of a being which I call myself, my mind, my person.
3 Those things did really happen which I distinctly remember.
4. Our own personal identity and continued existence as far back as we remember distinctly.
5. Those things do really exist which we distinctly perceive by our senses, and are what we perceive them to be.
6. We have some degree of power over our actions, and the determinations of our wills.
7. The natural faculties by which we distinguish truth from error are not fallacious.{218}
8. There is life and intelligence in our fellow-men with whom we converse.
9. That certain features of the countenance, sounds of

the voice, and gestures of the body, indicate certain thoughts and dispositions of the mind.

10. There is a certain regard due to human testimony in matters of fact, and even to human authority in matters of opinion.

11. There are many events depending on the will of man in which there is a self-evident probability, greater or less according to circumstances.

12. In the phenomena of nature, what is to be will probably be like to what has been in similar circumstances.

II. P/RINCIPLES RELATING TO\ N/ECESSARY\ T/RUTHS\.

1. Grammatical; as, that every adjective in a sentence must belong to some substantive expressed or understood.

2. Logical axioms; such as, any contexture of words which does not make a proposition is neither true nor false.

3. Mathematical axioms.

4. Axioms in matters of taste.

5. First Principles in Morals; as, that an unjust action has more demerit than an ungenerous one.

6. Metaphysical; as that,

a. The qualities which we perceive by our senses must have a subject, which we all body; and that the thoughts we are conscious of must have a subject, which we call mind.

b. Whatever begins to exist must have a cause which produced it.

c. Design and intelligence in the cause may be inferred with certainty from marks or signs of it in the effect.

The first remark I have to make on this scheme is, that it may be doubted whether the distinction which he draws between contingent and necessary truths is so profound as he would represent it. The test of the latter is that " their contrary is impossible." But is it not true of all the truths of common sense when they are properly expressed, that their contrary or rather contradictory is impossible? Thus take the {219} case of the intuitive conviction of our own existence. The conviction is not that I must have existed, but that " I do now exist; " and of the contradictory of this, " I do not now exist," the conviction is as impossible as of the contradictory of the metaphysical principle of substance and quality, -- namely, that this quality does not imply a substance.

Looking to the account as a whole, including the division and arrangement, it seems to me sufficiently crude. Some of the principles enumerated under the head of contingent truths have no claim to be regarded as original laws of reason; such as the signification of sounds of the voice, and gestures of the body, the belief in human testimony, and the uniformity of nature. These seem rather to be the result of a gathered experience, to which we may be impelled by natural inclination; and in all such cases the natural principle, which in the case of the uniformity of nature is the principle of cause and effect, should have been enunciated, and not the experiential rule. If these laws were principles of reason, there could be no exceptions

to them: but every one knows that the sounds of the voice, and the expression of the countenance, and human testimony, may deceive; and it is conceivable that the present order of things may be changed "as a vesture." I cannot see how, under the head of principles relating to necessary truth, he should include convictions relating to so artificial a product as language. It may be argued, I think, that the principle of design is a modification of the principle of causality; that is, discovering design as an effect, we argue an intelligent cause. By his loose statements he exposed himself to the criticism of Priestley,[61] who {220} objects to our regard for testimony as being a principle of common sense. " It is a long time before a child hears any thing but truth, and therefore it can expect nothing else. The contrary would be absolutely miraculous." But while Reid may be justly charged with a defect of critical analysis, and of categorical expression, he has enunciated in a plain manner an immense body of important truth which can be shown to have the sanction of intuitive reason.

The question has been much discussed, Where did Reid get the phrase common sense? I believe it is not difficult to settle that question. The phrase was introduced formally into philosophy by Shaftesbury, who, however, shows that it was in use before. Reid has been charged with borrowing it without acknowledgment from Buffier, who certainly employs it in much the same sense as Reid.[62] But it might be argued with greater show of reason, but yet with no sufficient reason, that Buffier, who published his " First Truths " in 1717, took it from Shaftesbury or those who were familiar with the writings of Shaftesbury, which became known on the Continent at an early date. It is certain that by the time of Reid the phrase was in constant use.[63] Even Berkeley says that " since his revolt from metaphysical notions to the plain dictates of nature and common {221} sense he found his understanding strangely enlightened." (Preface to " Dialogues.") In the previous age philosophy had taken up a number of extreme positions, and those who were not ready to adopt them, and yet were not prepared to refute them by logic, were everywhere appealing to common sense.

Notwithstanding the able and learned defence of the phrase by Hamilton, I look upon it as an unfortunate one. The word sense seems to associate the faculty with the bodily organism, with which certainly it has no connection. Still the term was so frequently used by Locke, Shaftesbury, and Hutcheson, who all talked not only of a bodily but an internal sense, while the two latter called in a moral sense and a sense of beauty, that it might, in accordance with established usage, be employed to indicate that the sense common to all mankind is an original inlet of knowledge,-an aspect often overlooked by those who represent it as an <a priori> form or regulative principle. By employing the word, Shaftesbury, Hutcheson, and Reid meant to intimate that there are other sources of ideas besides the external and internal senses, sensation and reflection. The fundamental objection to the phrase "common sense" is, that it is ambiguous. In saying so, I do not refer to the meaning attached to it by Aristotle, who denoted by [Greek quote] the knowledge imparted by the senses in common. This

continued, for long, to be one of the meanings of the phrase in philosophy; but by Reid's time it was thus known only to scholars. In the use which Reid makes of it, there is a fatal ambiguity. It is employed to signify two very different things. It denotes that combination of qualities which constitutes <good sense>, being, according to an old saying, the most uncommon of all the senses. This valuable property is not common to all men, but is possessed only by a certain number; and there are others who can never acquire it, and it is always the result of a number of gifts and attainments, such as an originally sound judgment and a careful observation of mankind and the world. In this signification common sense is not to be the final appeal in philosophy, science, or any other department of investigation; though in all it may keep us from much error. Practical sense, as it claimed to be, long opposed the doctrine of there being an antipodes and of the earth moving; it spoke contemptuously in the first instance of some of the greatest achievements of our world, the deeds {222} of philanthropists, and the sufferings of martyrs; it laughed at the early poetry of Wordsworth and Tennyson. All that good sense can do in science and philosophy is to guard us against accepting any doctrine till it is settled by inductive proof.

But the phrase has another and a different signification in the philosophical works, including Reid's, of last century. It denotes the aggregate of original principles planted in the minds of all, and in ordinary circumstances operating in the minds of all. It is only in this last sense that it can be legitimately employed in overthrowing scepticism, or for any philosophic purpose. Reid seeks to take advantage of both these meanings. He would show that the views he opposes, though supported by men of high intellectual power,-such as Locke, Berkeley, and Hume, -- have the good sense of mankind against them. It can easily be shown that he employs the phrase once and again to designate sound practical judgment. He describes Newton's "Regulae Philosophandi" as " maxims of common sense." (P. 97.) He is constantly opposing common sense to reason and philosophy; whereas he admits elsewhere, using the phrase in the other sense that " philosophy has no other root but the principles of common sense." (p. 101.) This dexterous attempt to combine the two meanings, while perhaps contributing to the immediate popularity of Reid, and still more of Beattie, turned in the end against them (in the use of a two-edged sword, one edge is apt to wound him who uses it) in the estimation of philosophic thinkers, who, looking on the appeal as only to vulgar judgment, which may be prejudice, have denied the validity of the argument.

Hamilton has succeeded, so I think, in showing that the argument as employed by Reid is valid in itself, and legitimately used against scepticism. His appeal is to principles in our constitution which all are obliged to admit and act upon. But an appeal in a loose way to a sense supposed to be in all men may be very illusive. In order to its philosophical application, it must be shown that the principle is in all men as a necessary principle; and this Reid has commonly done, though there are cases, we have seen, in which he admits first principles too readily. But

he should have done more: it is only when we have carefully ascertained the precise nature of the original perception, and expressed it in a law, that we are entitled {223} to employ it in constructing a philosophy or in opposing scepticism. As long as it is a mere loose appeal to an undetermined principle, the argument may be very illusive. At this point Reid has often failed, owing to a deficiency of logical power. What he calls in is commonly a genuine mental principle; but, owing to his not furnishing a rigid account of its nature and its laws, we may be in doubt whether the application which he makes of it is legitimate. The important work of Reid needs to be supplemented by an investigation, conducted in his own careful manner, of the precise nature of the principles of common sense, of their points of agreement and of difference, of their precise laws and varied modes of action.

It is not easy to determine to what the appeal is ultimately to be in the philosophy of Reid. It is to common sense: but in what signification? Because it is a sense? Or because it is so constituted as to discern objects and truth? Or because it is common to all men? Or because we must trust to it whether we will or no? It is not easy to ascertain what would be Reid's, or even Hamilton's, answers to these questions. There are frequent passages in which Reid's appeal seems to be to the constitution of our minds (Hamilton's ultimate test, like Kant's, seems to be necessity); for he says, we " cannot have a better reason for trusting consciousness, than that every man, while his mind is sound, is determined by the constitution of his nature, to give implicit belief to it." But some one may ask, Why should we trust our constitution? May not our constitution, common or individual, deceive us? Has Hume succeeded in showing that our constitution followed out in different ways leads to contradictions? To such questions Reid would have little else to say than that we <must> attend to these principles of common sense; and this would make his appeal to be, like that of Kant and Hamilton, to stern necessity. It is worthy of being stated that, in his manuscript papers,[64] an answer is attempted to some of these questions, and this of a more satisfactory kind than any thing I have noticed in his published writings. " As soon as this truth is understood, that two and two make four, I immediately assent to it; because God has given me the faculty of immediately discerning its truth, and if I had not this faculty, I would not perceive its truth. The truth {224} itself, therefore, does not depend on my constitution; for it was a truth before my existence, and will be a truth, although I were annihilated: but my perception evidently depends on my constitution, and particularly upon my having, as a part of my constitution, that faculty, whether you call it reason or common sense, by which I perceive or discern this truth." "The truth of this proposition, that a lion is a ravenous beast, depends on the constitution of a lion, and upon nothing else." In like manner as to right and wrong "although the rectitude or depravity has a real existence in this case, yet it cannot be discerned by a spectator who has not the faculty of discerning objects of this kind." "Evidence is the sole and ultimate ground of belief, and self-evidence is the strongest possible ground of belief; and he who desires

reason for believing what is self-evident knows not what he means." Any one who would join into a consistent whole the various characteristics referred to in this paper, and give each its exact place, will advance a step beyond Reid, and, I may add, beyond Hamilton. The question occurs, Why has he not' placed these statements in his published works? Was it because he was not prepared to reduce them to a rigid consistency, and was averse to utter anything which he could not stand by in every respect?

It is also worthy of being noticed that, in one of the manuscripts, he shows that he had a glimpse of the distinction between what Kant calls analytic and synthetic judgments. The question is put, "Is there not a difference between the evidence of some first principles and others?" and he answers, "There are various differences. This seems to be one, that, in some first principles, the predicate of the proposition is evidently contained in the subject, as in this, two and three are equal to five, a man has flesh and blood; for, in these and the like self-evident principles, the subject includes the predicate in the very notion of it. There are other first principles in which the predicate is not contained in the notion of the subject, as when we affirm that a thing which begins to exist must have a cause." This last is an example of what Kant calls synthetic judgments a priori. Reid, however, has not laid hold of the distinction so firmly as Kant, nor did he see its importance, and elaborate it so fully as the great German metaphysician. It is interesting to notice these correspondences between the Scottish and German opponents of Hume. {225}

I do not mean to dwell on the remaining portion of the essays, which contain many sound remarks, but little that is fresh and novel.

<Reasoning>. This essay has nothing worthy of comment, except a vigorous attempt to show, as against Locke, that morality is not capable of demonstration.

<Taste>. He argues that "it implies an original faculty, and that it is in the moral and intellectual perfections of mind, and in its active powers, that beauty originally dwells." In a letter to Rev. Archibald Alison, he claims: " I am proud to think that I first, in clear and explicit terms, and in the cool blood of a philosopher, maintained that all the beauty and sublimity of objects of sense is derived from the expression they exhibit of things intellectual, which alone have original beauty." (p. 89.) Possibly this may be a pretty close approximation to the truth. It seems to me to be a more just and enlightened view than that presented by Alison, and those Scotch metaphysicians who refer beauty to the association of ideas capable of raising feeling.

<Active Power in General>. He argues resolutely, that we have an idea of active power, and examines the doctrines of Locke and Hume. It does not appear to him that there can be active power " in a subject which has no thought, no understanding, no will." He maintains that natural philosophy, even if brought to perfection, " does not

discover the efficient cause of any one phenomenon in nature." He draws the distinction between efficient and physical causes. " A physical cause is not an agent. It does not act, but is acted on, and is passive as to its effect." (P. 74.) He holds that it is the business of natural philosophy, to discover physical cause. On this, Cousin remarks that " to pretend that all cause is necessarily endowed with will and thought, is to deny all natural cause." The human race believes in the reality of natural causes: it believes that the fire burns, that the fire is the cause of pain which we feel, &c.; and, at the same time, according as it reflects, it attaches all natural causes to their common and supreme principle." When we discover a true physical cause, say that oxygen and hydrogen when joined in certain proportions, produce water, intuitive reason leads to believe that there is property, that is power, in the object; that the physical cause is truly {226} an efficient cause; and that the effect follows from a power in the agents.

<Will>. He is a strenuous advocate of free-will. " Every man is conscious of a power to determine in things which he conceives to depend on his determination." He draws the distinction between desire and will. " The distinction is, that what we will must be an action, and our own action: what we desire may not be our own action; it may be no action at all. The following statement is taken from the manuscripts: "I grant that all rational beings are influenced, and ought to be influenced, by motives. But the relation between a motive and the action is of a very different nature from the relation between an efficient cause and its effect. An efficient cause must be a being that exists, and has power to produce the effect. A motive is not a thing that exists. It is only a thing conceived in the mind of the agent. Motives supply liberty in the agent, otherwise they have no influence at all." Such statements may not go down to the depths of this deep subject, but they are worthy of being considered and weighed.

<Principles of Action>. By which he means "every thing that makes us to act." He divides them into mechanical, animal and rational. Under mechanical be includes instincts and habits. Under animal principles, appetites and desires, benevolent affections and passions. The rational embrace a regard to our good upon the whole, the notions of duty, rectitude, and moral obligation; and, in treating of these, he offers observations on conscience, maintaining that it is both an active and intellectual power.

<The Liberty of Moral Agents>. He had entered on this subject in treating of the will. He now discusses it more fully, showing that man has a power over the determination of his own will, and that we have by our constitution a natural conviction or belief that we act freely.

<Morals>. If he delivered nothing more to his class than is contained in this essay, it must have been a very defective system of moral philosophy; but there is no reason to believe that he published all the instruction he conveyed in college. What he does say is always weighty. He shows that there are first principles in morals, that an action

deserving moral approbation must be done with the belief of its being morally {227} good. "Hence it follows necessarily that the moral goodness which we ascribe to an action considered abstractly, and that which we ascribe to a person for doing that action, are not the same." He is careful to explain that "morality requires not only that a man should act according to his judgment, but that he should use the best means in his power that his judgment be according to truth," thus pointing to a standard above the judgment. He argues powerfully against Hume that justice is a natural, and not a mere artificial, virtue. He maintains that we draw the sentiments of justice from conscience. That these sentiments are not the effects of education or acquired habits we have the same reason to conclude, as that our perception of what is true, and what is false, is not the effect of education or acquired habits." " By the conscience we perceive a merit in honest conduct, and a demerit in dishonest, without regard to public utility." He is particularly successful in proving that a contract implies an obligation, independent of the beneficial or prejudicial consequences that may follow.

XXVII.-THE ABERDEEN PHILOSOPHICAL SOCIETY.[65]

T/HIS\ society deserves a special notice, as from it proceeded, directly or indirectly, the greater number of the works of the Aberdeen metaphysicians. The names of the members are worthy of being preserved, as they were all men of ability. The original members were Dr. John Gregory, Dr. David Skene, Mr. Robert Trail, Mr. George Campbell, Mr. John Steward and Mr. Thomas Reid. In 1758, were elected Mr. Charles Gordon, Mr. Alexander Gerard, Mr. John Farquhar (minister at Nigg), and Mr. John Kerr. In later years were elected Mr. James Beattie in 1760, Dr. George Skene in 1763, Mr. W. Ogilvy in 1763, Mr. James Dunbar in 1765, and Mr. William Traill in 1766. Dr. Reid was secretary for the first year. The society met twice a month, in the afternoon or evening, in a tavern in one or other of the towns. We are amused at the provision made by the philosophers for their bodily wants. There was an entertainment, the expense of which was not to exceed eighteen pence a head; the whole expense might be about ten shillings, of which one-half was for a bottle of {228} port, for punch and porter, the other half for the more solid eatables. It was a written rule, showing how anxious the grave men were to secure propriety, that "any member may take a glass at a by-table while the president is in the chair, but no health shall be drunk during that time." The meeting continued its sittings for three hours, there being room for free conversation half an hour before, and half an hour after, the president took or vacated the chair. The attendance may have averaged half a dozen. The first meeting was held Jan. 12, 1758. About 1772, the forfeits for nonattendance are getting heavy, and discontent is expressed. The minutes show a meeting so late as February, 1773, after which the society disappears.

The society was formed for the purpose of reading discourses or dissertations, and making observations on the subjects of them, and of discussing questions proposed and sanctioned. " The subjects of the discourses and questions shall be philosophical; all grammatical, historical, and

philological discussions being conceived to be foreign to the design of this society [it is evident that they had no idea of the importance of philology]. And philosophical matters are understood to comprehend every principle of science, which may be deduced by just and lawful induction from the phenomena either of the human mind, or of the material world; all observations and experiments that may furnish materials for such inductions; the examination of false schemes of philosophy and false methods of philosophizing; the subserviency of philosophy to arts, the principles they borrow from it, and the means of carrying them to their perfection."

It is interesting to notice that so many of the speculations of the Aberdeen philosophers, afterwards given to the world in their published writings, were first laid before this society. Thus Dr. Reid, on May 24, 1758, intimates that the subject of his discourse at next meeting (June 13) is to be " The philosophy of the mind in general, and particularly on the perceptions we have by sight." In 1760, he gives an analysis of the senses, and a discourse on the sense of touch. On Jan. 26, 1762, he read a discourse at the laying down of the office of president, on " Euclid's definitions and axioms." On Oct. 11, 1762, Dr. Reid read a discourse, which the society approved of; but he declined inserting it, in regard he proposed soon to send it to the press, along with the other discourses he had read before the society.

Gerard, too, discourses on his own subjects, from 1758 to 1771, and reads a series of papers on genius, and a paper on the effect of the passions on the association of our ideas. Between 1761 and 1768, be inquires: " What is peculiar to those Operations of the Mind of which we can form some Ideas, and what distinguishes them from other Operations of the Mind of which we can form no Ideas? " He writes on the Principles which determine our Degrees of Approbation in the Fine Arts; upon the " Characters of Poetical Imagination; " upon the " Difference between Common Sense and Reason; " and he gives a series of papers on the " Universality and Immutability of the Moral Sentiment." From 1761 to 1767, Dr. Campbell reads papers on " Eloquence; " on " The Relation of Eloquence to Logic; on " The Dependence of Eloquence on Grammar." {229}

The other members take up cognate subjects. Traill takes "An Abstract of a Discourse of M. Rousseau, of the Sourse [so spelled] of the Inequality among Mankind." Mr. Gordon treats of "Memory and its Influence in forming Characters among Men; " on the " Origin of Polytheism;" on the Universal Belief in a Deity; on the " Existence and Perfections of the Supreme Being; " on " Language; " and on the "Alphabet." Farquhar reads on the " Imagination," and a " Particular Providence." Dr. David Skene has a paper on "The Different Branches of Philosophy," particularly "The Study of the Nature and Philosophy of the Mind." Dr. Gregory discourses on "The Usefulness of Natural Philosophy" on The Prolongation of Human Life;" "The Retardation of Old Age; and "The Foundation of Taste in Music." Mr. Ross takes up "The Use of the Leaves of Plants;" and "The Methods of

Classing Plants." Professor Stuart writes on the "Nature of Evidence" on "Mathematical Evidence;" on the "Evidence of Experience;" and "Moral Evidence." Dr. George Skene reads on "The Abuse of Mechanical Reasoning in Natural Philosophy." Mr. Traill discourses on " The Arrangement and Evidence of Mathematics;" and Dunbar, on "The Union of King's and Marischal Colleges," on " The Equality of Mankind," and "The Influence of Place and Climate upon Human Affairs." Dr. David Skene has a paper on "Happiness." Surely there is proof here of great intellectual activity, and of the keen interest felt in a wide range of subjects.

Most of the topics discussed turn round the various departments of mental science and speculative philosophy. But it will be seen, from the list of questions propounded for discussion, that they travelled over other fields. Many of the discussions had a special reference to the new sceptical philosophy; so that Reid could write to Hume, March 18,1763: ,Your friendly adversaries, Drs. Campbell and Gerard, as well as Dr. Gregory, return their compliments to you, respectfully. A little philosophical society here, of which all three are members, is much indebted to you for its entertainment. Your company would, although we are all good Christians, be more acceptable than that of Athanasius; and since we cannot have you upon the bench, you are brought oftener than any other man, to the bar; accused and defended, with great zeal, but without bitterness. If you write no more in morals, politics, or metaphysics, I am afraid we shall be at a loss for subjects."

XXVIII.-JAMES OSWALD.

P/RIESTLEY\ speaking of "a set of pretended philosophers, of whom the most conspicuous and assuming is Reid," says of Oswald, that he wonders bow his ,performance should have excited any other feeling than that of contempt." 'As to Dr. Oswald, whom I have treated with the least ceremony, the disgust his writings gave me was so great, that I could not possibly show him more respect." ("Examination of Dr. Reid's Inquiry.") Oswald's work is entitled " An Appeal to Common Sense in behalf of {230} religion." The first volume appeared in 1766, and it reached a second edition in 1768. The second volume was published in 1772. He takes substantially the same line of defence as Reid; but the " Appeal " is less pointed, and is vastly looser than Reid's " Inquiry; " and one feels it a dreary task to go through its platitudes. He entrenches himself behind certain distinctions recognized in the age. " The distinction between the occasion and cause of a thing is too considerable to be overlooked in a philosophical inquiry. Sensation and reflection, do indeed give occasion to all our ideas, but do not therefore produce them. They may in our present state be considered as the <sine qua non> to our most rational and sublime conceptions, but are not therefore the powers by which we form them." He opposes Lord Kames, and blames him for resting morality on feeling, and Adam Smith for resting it on sympathy, whereas it should be represented as founded on common sense. " Common sense perceives and pronounces upon all primary truths with the same indubitable certainty with which we perceive and

pronounce on objects of sense by our bodily organs." " By the discernment peculiar to rational beings we perceive all primary truths, in the same manner as we perceive objects of sense by our bodily organs." " Primary truths of religion and morality are as much objects of common sense as other primary truths." In the advertisement to the second volume, be mentions that some think that this Appeal ought to have set out with a definition of common sense; and be goes on to show that he does not mean by it common opinion, just or unjust. He calls it the simple authority of reason, or that capacity of pronouncing on obvious truth. " Reason requires our admitting primary truths on its authority, under the penalty of being convicted of folly and nonsense, if we do not." Oswald cannot be represented as grappling with the deeper problems of metaphysics, as, for example, with the question, whether the common sense is subjective or objective, or whether it is subjective in one sense, as it is in the mind, and objective in another sense, as the mind in many cases -- not all, however -- looks to external objects. He seems to me to be right when he combines two elements in moral apprehension: " we have a feeling, as well as perception, of moral excellence." Dr. Oswald was born in Dunnet became minister there (1727), and at Methven (1750), and died in 1793.

XXIX-- JAMES BEATTIE.[66]

J/AMES\ B/EATTIE\ was born Oct. 25, 1735, at the north-east end of Lawrencekirk, a village in the heart of the <Howe of the Mearns> in Kincardineshire, where his father kept a retail shop, and rented a small farm in the neighborhood. He was educated, {231} as so many eminent Scotchmen have been, at his parish school, and showed an early taste for reading, especially books of poetry. In 1749, he entered Marischal College, Aberdeen, where he competed for and received a bursary; and there his classical tastes were at once discovered by Dr. Blackwell, and there in coming years he studied philosophy under Dr. Gerard. In 1753, he was appointed schoolmaster of the parish of Fordoun about six miles from his native place, in a hollow at the base of the Grampians. He had all along a taste for the beauties of nature; and his poetical genius was kindled, and may have been partly guided into the direction which it took, by the peculiar scenery of the country, where a fine rich plain stretches out with a low range of hills overlooking the German Ocean on the one side, and the lofty Grampians on the other. The tradition is, that at this period of his life he would saunter in the fields or on the hills the livelong night, watching the aspects of the sky and welcoming the approach of day, and that he was specially fond of wandering in a deep and finely wooded glen in the neighborhood. While at this place he secured friends and patrons in the parish minister, in Lord Monboddo and Lord Gardenstone. The last named of these having seen some pieces of his poetry in manuscript, and being in doubt whether they were entirely the composition of so young a man, asked him to translate a passage of Lucretius; whereupon Beattie retired into an adjoining wood, and produced a translation in a very short time. While a schoolmaster at Fordoun, he seems to have attended divinity lectures during several winters at Aberdeen, with a view to the gospel ministry; but

he soon relinquished the pursuit. In 1757, he stood a competitive examination for the office of usher in the grammar-school of Aberdeen, and was defeated; but so satisfied were the judges of his qualifications that, on the office falling vacant the following year, he was appointed to it without any farther examination. In this more public position, his literary abilities became known; and, through the influential friends whom he had acquired, be was installed professor of moral philosophy and logic in Marischal College in 1760. About this time he became a member of the Aberdeen Club, and associated with such men as Reid, Campbell, John Gregory, and Gerard.

As professor, he lectured and examined two or three hours {232} every day, from November to April, on pneumatology, embracing psychology and natural theology; on speculative and practical ethics, economics, jurisprudence, politics, rhetoric, and logic, with readings in Cicero and others of the ancient philosophers. As a moral philosopher, he felt himself called to oppose the scepticism of which Hume was the champion. It appears from letters of Dr. John Gregory, published in Forbes's Life of Beattie," that atheism and materialism were at that time in high fashion, and were spouted by many who used the name of Hume, but who had never read his works, and who were incapable of understanding them. Reid had for years been examining the foundations of philosophy, which Hume had been undermining, and published his " Inquiry" in 1764. Beattie followed in 1770, with the Essay on "The Nature and Immutability of Truth." This work was his principal study for four years: he wrote it three times over, and some parts of it oftener. It had so rapid a sale that, in 1771, a second edition was demanded; and, shortly after, there were proposals to translate it into French, Dutch, and German. While engaged in these severer labors, he was all the while cherishing, what I suspect was to him the more congenial occupation, his taste for poetry. So early as 1766, he is laboring in the style and stanza of Spencer, at a poem in which he is to give an account of the birth, education, and adventures of one of the old minstrels. The First Book of the " Minstrel " was published anonymously in 1771, and a new edition of this Book and the Second Book, with his name attached, in 1774. Beattie, it may be acknowledged, stands higher as a poet than a philosopher. Some of his poems are in the first rank of their kind.

The personal incidents in his remaining life worthy of being recorded are not numerous. In 1767, he had married Miss Mary Dunn, who was inflicted with a tendency to mental disease, which broke out first in a distempered mind, and afterwards in insanity, which greatly distressed the kind husband, and compelled him at last to provide for her living separate from him. His quiet life was varied by several visits paid to London, where, as he became known by his works, he received considerable attention and was introduced to many eminent literary men. On two several occasions he had the honor of {233} an interview with George III., who had a great admiration of the character and object of his works, and granted him a pension. The famous painter Sir Joshua Reynolds took a fine portrait of him, with the " Essay on Truth " under his arm, and above him a winged

angelic being holding scales in one hand, as if weighing truth, and with the other pushing three hideous figures, supposed to represent Sophistry, Scepticism, and Folly (Reynolds meant two of these to be Voltaire and Hume),[67] who are shrinking away from the light of the sun, beaming from the breast of the angel.

His defences of religion were highly esteemed by several of the bishops and a number of the clergy of the Church of England, and he was offered a rich living if he would take orders in that church. This he declined, not because he disapproved of the doctrine or worship of the Episcopal Church, but he was apprehensive that by accepting such preferment he " might strengthen the hands of the gainsayer and give the world some ground to believe that the love of the truth was not quite so ardent or so pure as he had pretended." In 1773, Oxford University conferred an honorary degree of LL.D. upon him. The same year, he was offered the chair of moral philosophy in Edinburgh, but declined, as he preferred Aberdeen as his sphere, and was indisposed to go to a place where he would be in the heart of those he had attacked. His declining days were embittered by trials, which sank deep into his soul; such as the state of his wife, and the death first of one and then of the other of his sons, one of them being a very promising young man, called in early life to be his father's assistant in the college.[68] We discover traces of irritation in his afflictions; and one could have wished to see him sustained not only by what he sincerely entertained, a belief in providence and in the word of God, but in the peculiar doctrines of redemption and grace, so specially fitted to give comfort in trouble. He died Oct. 5, 1802. {234}

In person he was of a middle size, with something of a slouch in his gait; and in his latter years he was inclined to corpulency. He had dark eyes, and a mild and somewhat pensive look. There is an account of his life and writings in a work by Sir W. Forbes, in three volumes. It contains many of his letters, which are full of criticisms of no great profundity, and display at once the amiabilities and weaknesses of the author.

The following are the titles, with the dates, of his works: Poems (1760) Essay on Truth (1770); Minstrel, B. l. (1771); B. ". (1774); on Poetry and Music, on Laughter and Ludicrous Composition, on Classical Learning (1776); Dissertations on Memory and Imagination, on Dreaming, on the Theory of Language, on Fable and Romance, on the Attachments of Kindred, on Illustrations of Sublimity (1783); Evidences of Christianity (1786) Elements of Moral Science (1790-93). He has also Scotticisms, and original notes to an edition of Addison's papers.

His poems will ever hold a place among the classical writings of Great Britain. His " Minstrel " and his " Hermit" are exquisite poems of their kind: simple, graceful, tender, and leaving a peaceful and peace-giving impression on the mind; and therefore not likely to be appreciated by those whose tastes were formed by the passionate and startling style of poetry introduced in the next age by Byron, who was at school in Aberdeen while Beattie was in

his declining years. His prose works do not exhibit much grasp or depth of thought, but are characterized by much ease and elegance. In his lectures he dwelt fondly on style (" Elements of Mental Science," part 10), and his remarks are clear and judicious, though somewhat tame and commonplace, but not on that account the less useful. His criticism of the " Pilgrim's Progress " may be compared with that of Macaulay, written in a later age: " It was written about a hundred and thirty years ago, while the author, who had been a tinker, was in prison in Bedford, where he was confined twelve years. Some false notions in theology may be found in it; and the style is vulgar, and savors of the author's trade; but the fable is ingenious and entertaining." He everywhere holds forth Addison as the model English writer. His own style is without the idiom, the playfulness, the corruscations, the flexible windings by which the best papers of the "Spectator" are characterized. In reading such a work as his Moral Science," we feel as if we were walking along a road with pleasant grass and corn fields on either side, but without a {235} turn in it, and without a rock or stream, without a hill or valley. His papers on literary subjects are more attractive, as allowing free scope for his fine taste.

In his "Theory of Language" he argues strongly that speech is of divine origin. In his "Dissertation on the Imagination," which is very pleasantly written, he holds the theory, afterwards expanded by Alison, that the feeling of beauty arises from the association of ideas. He begins his " Elements of Moral Science " with psychology. He mentions the twofold division of the faculties into perception and volition, but says it is not accurate, and adds affections, approaching thus to the threefold division adopted by Kant and Hamilton. He mentions nine perceptive faculties: external sensation, consciousness, memory, imagination, dreaming, speech, abstraction, reason Judgment or understanding), conscience. I rather think he is right in giving speech a place among the native faculties, but we wonder to find dreaming there. His account of consciousness is loose and popular, but he avoids the error of Dugald Stewart in making it look merely at qualities, and of Kant in making it look merely at phenomena. " Of the things perceived by this faculty, the chief is the mind itself," &c. He has often valuable remarks on the faculties. Thus, under memory: " What we perceive by two senses at once has a good chance to be remembered. Hence, to read aloud slowly and with propriety, when one is accustomed to it, contributes greatly to remembrance; and that which we write in a good hand, without contractions, with dark-colored ink, exactly pointed and spelled, in straight lines, with a moderate space between them, and properly subdivided into paragraphs as the subject may require, is better remembered than what we throw together in confusion. For by all these circumstances attention is fixed, and the writing, being better understood, makes a deeper impression. Those things, also, which are related in two or more respects are more easily remembered than such as are related in one respect only. Hence, by most people verse is more easily remembered than prose, because the words are related in measure as well as in sense; and rhyme, than blank verse, because the words are related not only in sense and measure, but also by

similar sounds at the end of the lines." Some will think that the students who listened to such prelections ranging over all the faculties, {236} and touching on a great variety of topics, esthetical and moral, might be as much benefited as those who had to listen to the more scholastic discussions of the German universities. He says that " laughter is occasioned by an incongruity or unsuitableness of the parts that compose, or seem to compose, any complex idea or object."

The philosophical work by which Beattie was best known in his own day, and by which be is still known by students, is his " Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism." He quotes approvingly Reid's " Inquiry," and Campbell's " Philosophy of Rhetoric." In an edition published in 1776 he replies to some who had blamed him for borrowing some hints without acknowledgment from Dr. Price, Dr. Oswald, and Buffier. " I beg to say that I am to this hour totally unacquainted with that work of Dr. Price which is alluded to, and that when I published the first edition of the `Essay on Truth' I was totally unacquainted with the writings of Buffier and Dr. Oswald. I had heard, indeed, that the French philosopher used the term I common sense' in a way similar to that in which I use it; but this was only hearsay, and I have since found that, though between his fundamental opinions and mine there is a striking resemblance, his application of that term is not entirely the same." All I have to remark on this statement is, that if he had not read those well-known works on the subject of which he was treating he ought to have done so.

The work is pleasantly and pointedly written, and it had an immediate and wide circulation. It wants the depth and shrewdness of Reid's "Inquiry," but on that account was better relished by many readers, such as George III. The book is, throughout, a popular, rather than a scientific one. His somewhat <ad captandum> appeals gained the ear of those who had never been troubled with doubts, but rather turned away those who wished to find the great sceptic met by an opponent worthy of him.

His object is, first, to trace the several kinds of evidence up to their first principles; second, to show that his sentiments are in accordance with true philosophy and the principles of the most eminent philosophers; and, third, to answer sceptical objections. He says it is difficult, perhaps impossible, to give a {237} definition of truth; but endeavors to give such a description of it as may make others understand what we mean by the word. He then tells us that he accounts " that to be truth which the constitution of human nature determines a man to believe, and that to be falsehood which the constitution of human nature determines man to disbelieve." This makes the ultimate appeal to lie to man's constitution; and does not meet those who say that man's constitution may be an accretion of fortuitous agencies gathered in the course of ages, and may lead us into partial or total falsehood. According to this definition, there might be events without a cause in the constellation Orion, or at a " reasonable distance beyond," provided the constitution of the inhabitants there had been

determined by a different experience. He then distinguishes between truth perceived intuitively and truth perceived in consequence of a proof, and enters upon a discussion as to the most appropriate terms to employ to designate these two kinds of truth. " We might call the one `reason,' and the other reasoning; , but the similarity of the terms would frequently occasion both obscurity and harshness in the sound." Henceforward he seems to use the words " reason " and "reasoning" as synonymous, and uses "reason" in the sense of "reasoning." He is quite aware of the ambiguity in the phrase "common sense;" but he is to use it to denote that " faculty by which we perceive self-evident truth," and then distinguishes between common sense arid reason. This distinction between common sense and reason is no modern discovery, and he proceeds to quote Aristotle's account of axioms, principles, and common sentiments.

He starts the question, "By what criterion shall we know a sentiment of nature from a prejudice of education, a dictate of common sense from the fallacy of an inveterate opinion?" It is clear that Reid must often have had that question before him, but does not give a very articulate reply. Beattie answers it clearly, and I believe judiciously. " He takes that for an ultimate principle which forces our belief by its own intrinsic evidence, and which cannot by any reasoning be rendered more evident." Here the main stress is laid, as I believe it ought, on self-evidence, while necessity comes in secondarily; " it forces our belief by its own intrinsic evidence," a better account than that given by Leibnitz and Kant, who put necessity, in the front. {238} He illustrates his views by mathematical evidence and the evidence of sense; and shows that they agree, in both having the sanction of common sense. He argues that analogy and testimony are principles of common sense; but he is in evident difficulties when he is obliged to admit that both of these may deceive. He draws a distinction between two kinds of truths, each intuitively certain. " It is a character of some that their contraries are inconceivable; such are the axioms of geometry. But of many other intuitive truths the contraries are inconceivable. `I do feel a hard body,' `I do not feel a hard body;' these propositions are equally conceivable." If we would defend fundamental truth effectively, we must draw such distinctions; but the main point here is to determine what we are led intuitively to believe in the different cases. He shows convincingly, in opposition to Locke, that self-evidence is not confined to propositions.

He sustains these principles pretty satisfactorily; but when he proceeds to apply them in a criticism of Berkeley and Hume, is not eminently successful. He understands Berkeley, as he has been vulgarly understood, as denying the existence of matter; whereas Berkeley is continually asserting that he believes firmly in the existence of matter; only he regards it as having no existence, except as an idea, in a contemplative mind,-whereas our intuitive convictions represent it as having a reality, so far, independent of the mind contemplating it. The consequence is, that Beattie's objections are felt by us as missing the point; as when he argues that, if Berkeley's doctrine be true, we should not run out of the way of threatened danger.

He delights to point out some petty incongruities in Hume; but we see at once that he is not able to meet him face to face, and to wrestle with him. He acknowledges the superior abilities of Hume; but thinks the sceptics unworthy of any kind of reserve or deference, and maintains that their reasonings were not only false but ridiculous, and that their talents as philosophers and logicians were absolutely contemptible. {239}

XXX. -- GEORGE CAMBELL.[69]

W/E\ are still in an age in which young men belonging to county families devoted themselves to the work of the ministry of the gospel. George Campbell was the son of the Rev. John Campbell, a minister in Aberdeen, and one of the Campbells of Westhall, who claimed to be cadets of the house of Argyll. He was educated at the grammar-school, Aberdeen, and at Marischal College; and, being destined by his family to the law, he was apprenticed to a writer to the signet in Edinburgh. But he had a strong disposition towards the church, and he attended divinity lectures first in Edinburgh, and then in Marischal and in King's, Aberdeen. He was licensed to preach the gospel in 1746, and was settled as minister of Banchory-Ternan on the banks of the Dee in I 748. He was translated to a church in Aberdeen in 1757, and there (in 1758) became a member of the famous Philosophical Society, and contributed papers which were afterwards elaborated into volumes. In 1759, he was made principal of Marischal College, and every one felt that he was worthy of the office and fitted for it. In 1779, he was appointed professor of divinity in the same college, as successor to Gerard. In his opening lecture he says: " It is supposed that I am to teach you every thing connected with the study of divinity." " I am to teach you nothing; but, by the grace of God, I will assist you to teach yourselves every thing." He now resigned his city charge; but, as minister of Grayfriars, an office conjoined with the professorship, he preached every Sunday in one of the churches. It is a curious coincidence that as Reid succeeded the Rev. John Bissett in Old Machar, so Campbell succeeded him in Aberdeen: the earnest evangelical giving way in both cases to the cultured moderate. From his entrance into Aberdeen he was much admired by the educated and refined. The story is that some one told Gerard that he must now look to his laurels, whereupon the old professor replied that the incomer was indolent, a remark which was reported to Campbell, who {240} profited by it, and became remarkable for his diligence. It is certain that in his later years he showed amazing industry in his literary pursuits. From time to time he gave to the press sermons characteristic of the age: calm, dignified, elegant, and moral, full of reverence, and carefully free from all extravagance and fanaticism. One feels as if be should have been a bishop delivering charges to his clergy, fitted to sustain the dignity of the Church of England. His speaking is thus described The closeness, the force, the condensed precision of his reasoning exceed the power of description. Not a single superfluous word was used, no weak or doubtful argument introduced."

But he gave to the world more elaborate works. Hume's influence was now beginning to be felt, and in 1763,

Campbell publicly entered the lists against him, in " A Dissertation on Miracles." Before publishing the work, he transmitted through Dr. Blair a copy to Hume, who writes him in his usual pleasant manner, not entering into controversy, but stating how his own argument had occurred to him when a Jesuit was plying him with some " nonsensical miracle." In answering the sceptic, Campbell proposes to prove that testimony hath a natural and original influence on belief antecedent to experience. He may be right in saying that there is such a tendency, -- I believe it to be hereditary in children; but this can serve him very little in his argument, as it is not of the nature of a necessary principle, and he is obliged to admit that testimony often deceives, so that we are brought back, as Hume maintains, to experience. But he is more successful when he shows that experience can prove a miracle, and this notwithstanding that nature is uniform. " For this purpose I make the following supposition. I have lived for some years near a ferry. It consists with my knowledge that the passage-boat has a thousand times crossed the river, and as many times returned safe. An unknown man, whom I have just now met, tells me in a serious manner that it is lost, and affirms that he himself saw the passengers carried down the stream and the boat overwhelmed. No person who is influenced in his judgment of things, not by philosophical subtleties, but by common sense, a much surer guide, will hesitate to declare that in such a testimony I have probable evidence of the fact asserted." The last work published by him was " The {241} Four Gospels, translated from the Greek, with Preliminary Dissertations, and Notes Critical and Explanatory," 1789, The translation, though elegant, is not idiomatic; but the dissertations show a fine critical spirit. After his death, his " Lectures on Ecclesiastical History," his " Lectures on Systematic Theology and Pulpit Eloquence," and his "Lectures on the Pastoral Character," were published. But in this work we have to look merely at the philosophical discussions in his work on the " Philosophy of Rhetoric," which was commenced at Banchory, and published in 1776.

We have seen all throughout this history that the Scottish metaphysicians following Shaftesbury were fond of speculating about beauty and taste, and that all the Scottish thinkers at this time were anxious to acquire an elegant style. Adam Smith for several years read lectures with great eclat on rhetoric and belles-lettres in Edinburgh, under the patronage of Lord Kames, and afterwards did the same in the class of logic in Glasgow University. Lord Kames himself discussed like subjects in his " Elements of Criticism." The elegant preacher Dr. Hugh Blair lectured on the subject in the university of Edinburgh, and his " Lectures on Rhetoric and Belles-lettres " is one of the most useful books ever published on the art of composition. These works were used for several ages, not only in Scotland, but even in England, and helped to make rhetoric a leading branch of study in all the American colleges. Among all the works, Campbell's " Philosophy of Rhetoric " is perhaps the most philosophical, or is, at least, the one in which there is the most frequent discussion of philosophic problems.[70]

He opens: " In speaking, there is always some end in

view, or some effect which the speaker intends to produce on the hearer." The word <eloquence>, in its greatest latitude, denotes that art or talent by which the discourse is adapted to its end. In speaking of oratory suited to light and trivial matters, he endeavors to define wit. "It is the design of wit to excite in {242} the mind an agreeable surprise, and that arising not from any thing marvellous in the subject, but solely from the imagery she employs, or the strange assemblage of related ideas presented to the mind." This end is effected in one or other of these three was, -- first, in debasing things pompous or seemingly grave;" "secondly, in agarandizing things, little and frivolous; thirdly, in setting ordinary objects by means not only remote, but apparently contrary, in a particular and uncommon point of view."

He enlarges, as most of the Scottish metaphysicians have done, on the different kinds of evidence. He begins with intuitive evidence, which, he says, is of different sorts. " One is that which results purely from intellection. Of this kind is the evidence of these propositions: 'One and four make five;' things equal to the same thing are equal to one another; `the whole is greater than a part;' and, in brief, all in arithmetic and geometry. These are in effect but so many different expositions of our own general notions taken in different views." " But when the thing, though in effect coinciding, is considered under a different aspect, -- when what is single in the subject's divided in the predicate, and conversely, or when what is a whole in the one is regarded as a part of something in the other, -- such propositions lead to the discovery of innumerable and apparently remote relations." Under this head be also places, secondly, consciousness, "whence every man derives the perfect assurance which he hath of his own existence." He mentions, thirdly, common sense, giving to Buffier the credit of first noticing this principle as one of the genuine springs of our knowledge, whereas Shaftesbury had previously given it a special and important place. That he has not a definite idea of what common sense is as a philosophic principle, is evident from his stating that "in different persons it prevails in different degrees of strength," thus confounding the common principles of intelligence in all men with the sound sense possessed only by certain persons. He mentions a number of such principles, such as "whatever has a beginning has a cause;" "when there is in the effect a manifest adjustment of the several parts to a certain end, there is intelligence," "the course of nature will be the same tomorrow that it is to-day." He tries to draw distinctions between different kinds of intuitive truth. Thus, {243} in regard to primary truths of the third class, " it may be urged that it cannot be affirmed of them all at least, as it may be of the axioms in mathematics, or the assurances we have from consciousness, that the denial of them implies a contradiction." It is necessary, I believe, to draw some such distinctions as these between the various kinds of first truths; some of them seem to me to be of the nature of primitive cognitions, others of primitive judgments. But it is doubtful whether Campbell has been able to enunciate the nature of the difference. That he has no clear ideas of the relation of our primary perceptions to realities is evident from his

statement. "All the axioms in mathematics are but the enunciations of certain properties in our abstract notions, distinctly perceived by the mind, but have no relation to any thing without themselves, and cannot be made the foundation of any conclusion concerning actual existence; " as if the demonstrations of Archimedes as to conic sections had not been found to apply to the elliptic orbits of the comets as discovered by Kepler.

In speaking of deductive evidence, he distinguishes between scientific and moral. (1) "The subject of the one is abstract, in dependent truth, or the unchangeable and necessary relation of ideas; that of the other, the real but often changeable and contingent connections that subsist among things actually existing." (2). Moral evidence admits degrees, demonstration doth not. (3) In the one there never can be any contrariety of proofs; in the other, there not only may be, but almost always is. (4) The one is simple, consisting of only one coherent series; whereas moral evidence is generally complicated, being in reality a bundle of independent proofs. Under moral reasoning he treats of experience, analogy, testimony, calculation of chances, &c. He discusses the nature and use of the scholastic art of syllogizing. He has no idea of the syllogism being merely an analysis of the process which passes through the mind in all ratiocination. His objections have been satisfactorily answered by Whately.

He has a very interesting chapter on the cause of that pleasure which we receive from objects or representations that excite pity and other painful feelings, criticising the explanations by others, and unfolding one of his own, which is rather complicated. We are not concerned to follow him when he enters {244} on style and elocution. Speaking of his philosophic ability, I am inclined to place him next to Reid in the Aberdeen school.

When minister at Banchory, he married Miss Farquharson, of Whitehouse, of whom "I can say with truth that I never knew a more pious, more humane woman, or a woman of better sense. She had an enlargement of sentiment not often to be found in man (who have many advantages by education), and very unlike the contracted notions of the party among whom she had been bred. You will not mistake me, my dear; it is not those of the Church of England I mean, -- a society for which I have a great respect, -- but our Scotch nonjurors, who, though they concur pretty much with the other in the ceremonial part, differ widely in the spirit they infuse." This is an extract from letters to his niece, Annie Richardson, who bad gone to a boarding-school at Durham. These letters are preserved in the Farquharson manuscripts, and are very kindly. "You may depend upon it we do not forget our dear little niece who has been so long with us, and whom we do and cannot help considering as one of ourselves, -- as an essential part of our little family." The advices given, though rather commonplace, are not on that account the less useful. " Let it be an invariable maxim with you, my dear, that no art will continue long to have influence but what is founded on truth. Deceit and falsehood may sometimes serve a present turn, but never fail sooner or later to be detected. An injury is done to the

integrity of one's own mind by doing what is wrong, though it should never be discovered; the discovery which commonly follows injures one's character." His religious counsels are characteristic: " In regard to religion, you are now at the time of life when it specially claims your attention; and I shall at present only observe to you that you ought to study to be possessed of the spirit of it, which consists truly in fearing God and working righteousness; in other words, in loving God and your neighbor; but avoid carefully an excessive attachment to any particular form or mode of worship. The two extremes to be guarded against are libertinism and bigotry. The former consists in the want of a proper sense of religion; and the latter in an inordinate attachment to forms, or to any of the distinguishing badges of a particular sect or party." {245}

In the Farquharson manuscripts there are letters from Dr. Douglas, of Windsor, from which we gather some glimpses of the times. " It appears that in Oxford and Cambridge the number of students [letter dated 1789] had greatly decreased in consequence of the little attention which many of the bishops of late years had paid to their degrees." He goes on to say: The very great influx of young men from Scotland offering themselves as candidates for orders has been generally remarked. This did not use to be the case, and nothing perhaps will check it but a strictness which, in particular cases, will, I have no doubt, be dispensed with." It appears from these letters that he is in London in July, 1787, along with Dr. Beattie and his son, and that he is making arrangements about the publication of his "Dissertations." He spends a week with Dr. Douglas; and had the honor of a little conversation with his Majesty no less than three different times, and once, which is still more, with the Queen. " It is not to be questioned, that, after such distinction, I feel myself a much greater man than when you knew me at Aberdeen."

In person he was below the middle size, with a mild and delicate expression. In conversation he was pleasant and agreeable, though at times falling into fits of absence. He resigned his professorship in I 795, and soon after his principalship. He died April 1, 1796.

XXXI.-- JAMES BURNETT (LORD MONBODDO).

H/E\ was descended from an ancient family in Kincardineshire, and was born in October, 1714, at Monboddo, which is beautifully situated on the southern slope of the Grampians, and commands a view of the <Howe of the Mearns>, lying below it. He received the rudiments of his education at the parish school of Laurencekirk, which lies a few miles off, and studied the usual branches at King's College, Aberdeen, where he showed a taste for Greek literature, and graduated there in 1729. It was still the habit of Scottish youths who wished to have a high education to resort to Holland, and he went to Groningen, where he continued three years studying civil law, and where, {246} it is reported, in the society of some English Gentlemen and French refugees, he contrived to get rid of his Scotch pronunciation, and to acquire an accurate knowledge of the French tongue. In 1738, he was admitted to the Scotch bar,

where he rose to eminence by his learning and his shrewdness, and particularly distinguished himself in the famous Douglas case, and helped to gain the title and estates for his client. In 1767, he was raised to the bench by the title of Lord Monboddo. As a judge, he was painstaking and upright; his decisions were sound, and supported by great erudition and acuteness-. From time to time he rode up to London on horseback, and there mingled in the best literary circles, with such men as Murdoch, Armstrong, James Thomson, and Mallet, Markham, the Archbishop of York, Earl Stanhope, the first and second Earls of Mansfield, Lords Thurlow and Grantley, Bishops Horsley, Lowth, Porteous, Shipley, and Burgess, Sir John Pringle, Lewis, Scot, Seward, and Harris the author of "Hermes." While there, he showed himself at the levee and drawing-room at St. James, where the King took special notice of him.

He married a very lovely woman, Grace Farquharson, who died early, having had three children, a son and two daughters; the son and one of the daughters were cut off to the great distress of the father. The poet Burns, who received much attention from the judge, addressed a poem to that daughter, and says of her: "There has not been any thing nearly like her, in all the combinations of beauty, grace, and goodness the great Creator has formed, since Milton's Eve, on the first day of her existence." In the midst of his legal studies and his domestic afflictions be ever turned eagerly to metaphysical pursuits. In 1773, he published his elaborate work, "On the Origin and Progress of Language," and at various times from 1779 to 1799 his still larger work on " Ancient Metaphysics." At his country seat, he acted the farmer, lived on terms of pleasant familiarity with the people on his estate, was generously hospitable, and zealously promoted agriculture in his neighbor hood. At this place he received Samuel Johnson on his Scottish tour. In Boswell's account of the intercourse of the two, Lord Monboddo appears in by no means a disadvantageous light. He died at his house in Edinburgh, May 26, 1799. {247}

The eccentricities of his opinions and his conduct never interfered with his practical sagacity, or lowered him in the esteem and affection of the community. " His unbounded admiration of the customs, the literature, and the philosophy of the ancients strongly prepossessed him in favor of whatever was connected with such studies. In them, he supposed that he beheld all that was praiseworthy and excellent, while he looked on the moderns as a degenerate race, exhibiting only effeminacy and corruption. This attachment to ancient manners led him to imitate them, even in his amusements and habits of life. He was fond of athletic exercises in his youth, particularly fencing and fox-hunting, which tended to strengthen a constitution naturally healthy and robust. His general hour of rising in all seasons was six in the morning; and till a late period of his life he used the cold bath in the open air, even in the middle of winter. He took a light, early dinner, and a plentiful supper. The ancient practice of anointing, even, was not forgotten, though the lotion he used was not the oil of the ancients, but a saponaceous liquid composed of rose-water, olive oil, saline aromatic spirit, and Venice soap,

which, when well mixed, resembled cream. This he applied at bedtime, before a large fire, after coming from a warm bath. His method of travelling was also in conformity to his partiality for ancient customs. A carriage, which was not in common use among the ancients, he considered as an engine of effeminacy and sloth; and to be dragged at the tail of a horse, instead of mounting upon his back, appeared to him to be a truly ludicrous degradation of the genuine dignity of human nature."[71] In Kames's Life it is said his " temper was affectionate, friendly, social. He was fond of convivial intercourse, and it was his daily custom to unbend himself amidst a select party of literary friends, whom he invited to an early supper. The entertainment itself partook of the costume of the ancients; it had all the variety and abundance of a principal meal; and the master of the feast crowned his wine, like Anacreon, with a garland of roses. His conversation, too, had a race and flavor peculiarly its own. It was nervous, sententious, and tinctured with genuine wit. His apothegms, or, as his favorite Greeks would rather term them, were singularly terse and forcible, {248} and the grave manner in which he often conveyed the keenest irony, and the eloquence with which he supported his paradoxical theories, afforded the highest amusements of those truly Attic banquets which will be long remembered by all who had the pleasure of partaking in them."

I confess that I have felt a deep interest in reading the philosophical works of Lord Monboddo, -- he is so unlike any other Scotch metaphysician, he is so unlike his age. As appearing among a body of inductive inquirers, and in the middle of the eighteenth century, he looks very much like a megatherium coming in upon us in the historical period. His society is not with the modern empiricists, not even with the Latins, but with Plato and the Neo-Platonists, with Aristotle and his commentators. As regards the higher Greek philosophy, he is the most erudite scholar that Scotland has produced, not excepting even Sir William Hamilton. His favorite author among the moderns is Cudworth, whom he characterizes as " more learned in the whole ancient philosophy, the older as well as the later, than any modern author I know." He speaks of Locke's Essay as "no other than a hasty collection of crude, undigested thoughts, by a man who thought and reasoned by himself upon subjects of the greatest difficulty and deepest speculation, without assistance of leaming." He refers to Andrew Baxter, and charges the Newtonion astronomy with making the system of the heavens a mere machine; it supposes the universe had a beginning in time, contrary to all the ancients, who held that it " was an eternal emanation of an eternal being." It is mind that moves the celestial bodies, mind moving simply and uniformly. He refers to Berkeley, and also to Hume, lately deceased, and says of the latter, that his chief argument arises from "confounding sensations and ideas." He refers also to Reid's "Inquiry," and I suppose that the rising Scottish school was before him when he speaks of it as an unsatisfactory philosophy, which would maintain that " the perception of every sensible object is necessarily accompanied with a belief of its existence; that is the constitution of our nature, and that we are to inquire no more about it." He holds it " to be impossible that intellect can believe any thing without a reason." He

maintains that we do not form {249} ideas by nature. "We mistake habits of judging acquired by experience for the natural perceptions of sense." He thinks that by the eye we perceive objects first as double and inverted. His postulatum is that "the evidence of consciousness is infallible." " By consciousness, we know that we have perceptions of sense." "In the perceptions of sense, every man is conscious that he is passive, and that he is moved or excited to sensation by some thing." Of all his contemporaries, he is most thoroughly in sympathy with Mr. Harris, the author of " Hermes," with whom he corresponded.

We may here give an extract-letter from Lord Monboddo to Mr. Harris, in return for presentation copy of " Hermes."

> "Edinburgh, Wednesday, 26 March, 1766. -- As your works first introduced me to the Greek Philosophy, so this present you have now made me has revived my taste for that study, which, though never quite extinguished, had been lost for some time amid the hurry of law business. I fell on greedily, as soon as the book was sent me, and began with the most philosophical part of your I Hermes,' viz., the chapter upon General Ideas, which you have explained most truly and philosophically, according to the dictates of that school to which, I confess, I have entirely addicted myself, -- I mean the school of Aristotle, for as to Plato, he speaks of them in such mysterious and enigmatical terms, as if they had been a secret known only to himself; and I remember he makes Hippias the Sophist, when he was asked what the [Greek word] was, answer, `it was a fine virgin.' If philosophy was in such a state in the days of Plato, as not to understand perfectly what is the foundation of all science and knowledge among men, bow much is it indebted to that wonderful man, Aristotle, who, besides his discoveries in every branch of philosophy, has cleared the principles of it from that obscurity which the enthusiasm and mystic genius of Plato had thrown upon them?
>
> "I think I may, without the least suspicion of flattery, give to you the praise which Cicero takes to himself, of teaching philosophy to speak a new language; for as he taught it to speak Latin, so you have taught it to speak English. The language which Mr. Locke has put into her mouth is mere stammering, and is, in my opinion, as contemptible as the matter which be has made her utter. Mr. Hobbes I am not so well acquainted with; but as be is of the same heresy, that is, one of those who pretend to philosophize, without the assistance of the ancients, I suppose he has succeeded as ill. As for myself, I am meditating great things in the literary way, but I am not sure that I will ever execute any thing. I have one work in view, which I think would not make a bad second part, if it were executed, to your I Hermes,'-- I mean a work showing the origin and progress of this most wonderful of all the arts of man, the art of speech. What set me upon this train of thinking was the study of some most barbarous and imperfect languages, spoken in America,

> from grammars and dictionaries which I had {250} out of the King's Library, when I was last at Paris. Besides the curiosity of seeing the process of so wonderful an art, in tracing the progress of language, you at the same time trace the progress of the human understanding, and I think I have already collected materials from which a very good history of the human mind might be formed,-- better, at least, than that which Mr. Locke has given us. This, if I had leisure, I would make part of a much greater work which I project, viz., a History of fan; in which I would propose to trace him through the several stages of his existence; for there is a progression of our species from a state little better than mere brutality to that most perfect state you describe in ancient Greece, which is really amazing, and peculiar to our species. But the business of a laborious profession will, I'm afraid, prevent me from executing this, and several other projects which I have had in my head. But with respect to you, being now eased of the care of public affairs, the world will certainly exact from you an account of your leisure; especially as you have given them such pledges of your capacity to instruct and entertain them. You have done enough upon grammar. But I would have you do something upon logic, to show an ignorant age that the greatest discovery in science ever made by any one man is the discovery of the Syllogism by Aristotle." [72]

He has two great philosophic works. The first is "Ancient Metaphysics, or the Science of Universals; with an Appendix containing an Examination of the Principles of Sir Isaac Newton's Philosophy." It is in six quarto volumes, averaging four hundred pages each. He treats first of metaphysics and then of man. The proper subject of metaphysics is " mind pure and separate from all matter." In nature, all is either body or mind or their accidents. There is not in the universe, so far as our knowledge extends, any body without mind; they are never separated in the material world. " What is moved I call body, what moves is called mind." " Under mind in this definition I include, 1st, the rational and intellectual; 2d, the animal life; 3d, the principle in the vegetable by which it is nourished, grows, and produces its like, and which, therefore, is commonly called the vegetable life; and 4th, the motive principle, which I understand to be in all bodies, even such as are thought to be inanimate." He says the Greek word [Greek word] denotes the three first kinds; the fourth, the motive, is not commonly in Greek called [Greek word], but Aristotle says it is [Greek words]. He makes moving or producing motion an essential property of mind. In respect of quality, motion applies to mind as well as {251} body. By motion the whole business of nature above, below, and round about us is carried on. " It is impossible that any thing can be generated, come to maturity, or be extinguished without passing from one state to another. Now that passage is motion." He proves the immateriality of mind in general, (1) from the nature of motion, (2) from the nature of body, (3) from the nature of mind. He establishes the two first <a priori>, and the third by a demonstration <ex absurdo>. He has then <a posteriori> proof. " Sensation cannot be produced by a material cause; reasoning and consciousness

far less."

Coming to minds, he adopts the Aristotelean distinction between the gnostic and orective powers. The gnostic powers are sense, phantasy, and comparison. In sense, the mind is not conversant with the visible object itself, but with the image or [Greek word], as the Epicureans called it, thrown off from the object. The essential distinction between sense and phantasia is, that what we perceive by the sense is present and operating upon the sense, whereas the object of the imagination is not present. Phantasy is only of sensible objects. Memory is only of ideas, and belongs exclusively to man. " Brutes have no idea of time, or of first and last. Phantasy serves to them the purpose of memory." The object is painted on the brute's phantasia, but without any perception of the time when he first saw it. Sense and phantasy perceive particular things, -- comparison, generals or ideas. He thinks that brutes possess the comparative faculty, and that here the mind of the brute acts without the assistance of the body. As to will, he reckons " all will as free, and, at the same time, it is necessary; but of a necessity very different from material or physical." Much of this psychology is avowedly taken from Aristotle, but at the same time exhibits traces of shrewdness and independence, and, it has to be added, of eccentricity.

He criticises Locke's theory of the origin of ideas. He acknowledges no innate ideas, if we mean ideas present to the mind, and contemplated before they are excited by objects; but they are there though "latent and unproductive," and are there even before our existence in this world. Nature, however, has so ordained it, that they can only be excited by the impulse of objects upon our organs of sense." It should be noticed here, that notwithstanding the prominence given to it by {252} Locke, Lord Monboddo has no recognition of reflection or consciousness as a separate source of ideas.

He dwells with evident fondness on categories or universal forms. All things are to be known by their causes. The knowledge of first causes belongs to metaphysics. Every thing that is to be known falls under one or other of the categories. He shows that God must have ideas. Man is capable of forming ideas. Time is not a cause, but is a necessary adjunct or concomitant of the material world. If nothing existed, it is evident there could be no such thing as time. His definition of time does not make the subject much clearer, as it introduces the phrase duration, which needs explanation quite as much as time does: " it is the measure of the duration of things that exist in succession by the motion of the celestial bodies. Beings which suffer no change, neither in substance, qualities, nor energies, cannot be in time. Of this kind we conceive Divinity to be, and therefore he is not in time but in eternity." As to space, it is nothing actually, but it is something potentially; for it has the capacity of receiving body, "for which it furnishes room or place." Here it should be observed that room or place comes in to explain space, which is as clear as either room or place, -- which are, in, fact embraced in it. " Space has not the capacity of becoming any thing, but only of receiving any thing."

He represents Aristotle as saying that the beauty of nature consists in final causes, without which we can conceive no beauty in any thing. In expounding his own views, he tells us that in a single object there may be truth, but no beauty. In order to give beauty to truth, there must be " a system, of which the mind, perceiving the union, is at the same time struck with that most agreeable of all perceptions which we call beauty. And the greater the variety there is in this system, the greater the number of parts, the more various their connections and dependencies upon one another, the greater the beauty, provided the mind can distinctly comprehend the several parts in one united view." There must be some truth here, though it may not be the whole truth.

In vols. iii. and iv. he treats of man. This is the only part of his book fitted to excite an interest in these times. " It is surprising," he says, " that so little inquiry has been made concerning {253} the natural history of our own species." He then proceeds to divulge his own theory, which, in some respects, is an anticipation of the Darwinian. He maintains that man was at first a mere animal, that he walked on all fours, and that he possessed a tail, of which we discover the rudiments. There has been a progression in mankind from one stage to higher they erect themselves, they learn the use of their hands, and they learn to swim. They lived first on natural fruits as they presented themselves, and then learned hunting and fishing. Men were for a time solitary, and then came to herd together. He is not so trustworthy as Darwin in his facts: he tells us that there is a whole nation of Esquimaux with only one leg; that the one-eyed cyclops of Homer is not a mere fiction; that in Ethiopia men have only one eye, and this in their foreheads and he expresses his belief in mermaids.

But he detects far higher properties than the Darwinians have yet done. Man's mind was at first immersed in matter; but, by exerting its native power, it can act without the assistance of body, and transports itself into that ideal world which every man who believes in God must believe to be the archetype of this material world. But he insists that there has been a great degeneracy in the race, of which Moses' account of the fall of man is an allegorical version. Corruption of manners begins in every nation among the better sort, and from them descends to the people. He shows that there must be a total reformation of manners and morals; and, in doing so, be speaks of the effeminacy which has arisen from the use of clothes. But he is ever insisting on the difference between man and brute. The actions of man proceed from opinion, but not the actions of brutes. In the lower animals there is no consideration of means and ends. He finds one great difference in the circumstance that man is dissatisfied, envies, and repines, which the brute creatures never do.

In volume vi. he treats of the being of God. Nothing can exist without a cause. A first cause, therefore, is necessary, and he inquires into what must be the nature of the cause of the world. The cause must be self-existent,

necessarily existent, eternal, and unchangeable Of this nature must be the efficient cause of the world. But he agrees with Aristotle that there must also have been a natural cause from all eternity. In {254} his work on language he represents the theology of Plato as more sublime than that of Aristotle. The theology of Aristotle, so far as it goes, is a pure system of theism; but it is defective in two great points. First, the providence of God over all his works is not asserted; on the contrary, God is represented as passing his whole time in contemplation. Secondly, he does not make God the author of the material world, but only the mover; he does not derive from Him even the minds that animate this world.

His work on " The Origin and Progress of Language," in six vols. 8vo., is less important. Still, it contains some shrewd remarks. By language he means the expression of the conceptions of the mind by articulate sounds. He does not think that language is natural to man. Men came to invent articulate sounds by the imitation of other animals. A political state was necessary for the invention of language. He had evidently some acquaintance with the affinities of the Teutonic, Persian, Greek, and Latin. He represents the Hebrew, Phoenician, Syriac, and Chaldaic, as having also an affinity. He believes that there may also be an affinity between the two groups.

He corrects a very common misapprehension of his day as to abstract and general ideas. In his work on metaphysics: "Abstract ideas are different from general, though they be confounded by our modern philosophers; an idea must be first abstracted from the particular object from which it exists before it can be generalized." In his work on language, he shows that we may have a conception of a particular quality of any substance abstracted from its other qualities without averring such quality to belong to any other substance. " In order to form the general idea, a separation or discrimination is necessary of these qualities one from another; and this kind of abstraction I hold to be the first act of human intellect, and it is here the road parts betwixt us and the brute; for the brute perceives the thing and perceives the perception in his memory just as the object is presented by nature-that is, with all its several sensible qualities united; whereas the human intellect separates and discriminates and considers by itself the color, <e.g.>, without the figure, and the size without either." {255}

XXXII.-ADAM FERGUSON[73]

H/E\ was the son of Rev. Adam Ferguson, minister of the parish of Loarerait, Perthshire, and was born June 20, 1723. The Scottish ministers often belonged to good families in these times, and Carlyle describes Ferguson as the son of a Highland clergyman with good connections and a Highland pride and spirit. He received his early education partly from his father, partly at the parish school. We are ever discovering traces of the influence of the parish schools of Scotland in producing its great men. He afterwards went to the gram mar school of Perth, where he excelled in classics and the composition of essays, which has always had a high

place in Scotland, fostered by the very circumstance that boys had to unlearn the Scottish and learn the English tongue. Thence he resorted to the University of St. Andrews, where he graduated May 4, 1742, with a high reputation in classics, mathematics, and metaphysics. He now entered on the study of theology, first at St. Andrews, and then in Edinburgh, where he fell into the circle of Robertson, Blair, Wedderburn, and Carlyle, and joined them in forming a debating society. Before finishing his theological course, he was appointed deputy-chaplain of the Highland forty-second regiment, and was present at the battle of Fontenoy, where he went into action at the head of the attacking column with a drawn sword in his hand. His military career helped him afterwards to give accurate descriptions of battles in -- his "Roman History," and furnished him opportunities for studying human nature and politics. He never had any predilection for the clerical profession, and abandoned it altogether on the death of his father. After spending some time in Holland, as so many Scottish youths had done in the previous century, he returned to his old associates in Edinburgh, where he was appointed, in 1757, David Hume's successor as librarian and clerk in the Advocate's Library. He there became a member of the "Select Society" instituted {256} in 1754 by Allan Ramsay, and holding its meetings in one of the inner apartments of the library, for literary discussion, philosophical inquiry, and improvement in public speaking. Among its members were Hume, Robertson, Smith, John Home, Wilkie, Lord Hailes, Lord Monboddo, Sir John Dalrymple, and the elder Mr. Tytler, the men who constituted the bright literary constellation of their age and Country. This society declined after a time, but was renewed in 1762, under the name (at the suggestion of Ferguson) of the " Poker Club." Ferguson became involved in the controversy stirred by his friend Home writing the play of Douglas, and published " The Morality of Stage Plays seriously Considered." He seems to have left the office of librarian rather abruptly, being allured by an offer to become tutor to the sons of Lord Bute. By the influence of his friends he was made professor of natural philosophy in the University of Edinburgh in 1759, and David Hume remarked: "Ferguson had more genius than any of them, as he had made himself so much master of a difficult science, viz., natural philosophy, which he had never studied but when at college, in three months, so as to be able to teach it." In 1760, he was elected to an office more congenial to him, that of professor of pneumatics and moral philosophy, as successor to Mr. Balfour, who took the chair of the law of nature and nations. In less than two years he published his " Essay on the History of Civil Society," a work on which he had been engaged for a considerable time. It was conceived in the manner of Montesquieu, but dwelt on elements at work in the formation of civil society which the French author had overlooked. Part I. treats of the " General Characteristics of Human Nature." Works on social economy proceed very much on the principle that man is mainly swayed by a desire to promote his own interests, and they furnish no analysis of the other interests which men look to. They do not consider that man has social and conscientious feelings, by which many are influenced quite as much as by self-love; and that he is as often swayed by caprice, vanity, and passion, as by a cold-hearted

selfishness. Ferguson perceived this. Mankind, we are told, are devoted to interest, and this in all commercial nations is undoubtedly true. But it does not follow that they are by their natural dispositions averse to society and mutual affection. {257} Speaking of those who deny moral sentiment, he says that they are fond of detecting the fraud by which moral restraints have been imposed; "as if to censure a fraud were not already to take a part on the side of morality." "The foreigner who believed that Othello on the stage was enraged for the loss of his handkerchief was not more mistaken than the reasoner who imputes any of the more vehement passions of men to the impressions of mere profit or loss." So, after discussing the question of the state of nature, he treats of the principles of self-preservation, of union among mankind, of war and dissension, of intellectual powers, of moral sentiment, of happiness, of national felicity. In unfolding these, be insists that mankind should be studied in groups or in society. He then traces these principles in the history of rude nations, of policy and arts, the advancement of civil and commercial arts, the decline of nations, corruption of political slavery. The tone of the work is healthy and liberal, but is filled with common-place thought and observation. I find a sixth edition published in 1793. After this it was not much heard of The French Revolution gave men more earnest questions to think of. But these disquisitions, and still more effectively the publication of the " Wealth of Nations," in 1776, kindled a taste for social inquiries in the University of Edinburgh and in the capital of Scotland.

The smallness of his salary, only L100 a year, tempted him to undertake the charge of the education of Charles, Earl of Chesterfield, nephew to the earl who wrote on manners, and he had the benefit of a continental tour with his pupil. He waited upon Voltaire at Ferney, where, he tells us, " I encouraged every attempt at conversation, even jokes against Moses, Adam, and Eve, and the rest of the prophets, till I began to be considered as a person who, though true to my own faith, had no ill-humor to the freedom of fancy in others." His description is graphic: " I found the old man in a state of perfect indifference to all authors except two sorts, -- one, those who wrote panegyrics, and those who wrote invectives on himself. There is a third kind, whose names he has been used to repeat fifty or sixty years without knowing any thing of them, -- such as Locke, Boyle, Newton, &c. I forget his competitors for fame, of whom he is always either silent or speaks {258} slightingly. The fact is, that he reads little or none; his mind exists by reminiscence, and by doing over and over what it has been used to do, -- dictates tales, dissertations, and tragedies, even the latter with all his elegance, though not with all his former force. His conversation is among the pleasantest I ever met with. He lets you forget the superiority which the public opinion gives him, which is indeed greater than we conceive in this island." In consequence of his absence, the town council tried to turn Ferguson out of his office in Edinburgh, but he resisted at law, and returned to his duties in 1775.

He had evidently a strong inclination to active life, which might bring him into new scenes and situations

favorable to the study of character. So in 1778 he was appointed secretary to the commissioners appointed to discuss and settle the points in dispute between Great Britain and her American colonies. In New York the commissioners received a communication from Congress intimating that the only ground upon which they could enter on a treaty would be an acknowledgment of the independence of the States and the withdrawal of the British force from America. So he returns the following year to his professorial duties, which it is interesting to notice were performed during his absence by his pupil, Dugald Stew art. During these years he became involved in the controversy about the authenticity of the " Poems of Ossian," taking, as might be expected of a Highlander, the side of Mr. McPherson. He also took an active part in the formation of the Royal Society of Edinburgh, which originated very much with Principal Robertson, and was incorporated in 1783. He had long been engaged on the work by which he was best known in his own day, " The History of the Progress and Termination of the Roman Republic." Avoiding the early and disputed period of Roman history, and leaving the later period to Gibbon, he gives a clear and judicious account of the time which elapsed between 240 /A.U.C.| and the death of Tiberius. I am not sure that we have a better account of the republic, published prior to the investigations started by Niebuhr.

In 1766, he had published a short syllabus of his lectures, entitled "Analysis of Pneumatics and Moral Philosophy, for the use of Students in the College of Edinburgh." Using this as a text-book, he lectured to his class without writing out what {259} he said. He claims, however, that he bestowed his utmost diligence in studying the subject, including the order in which it was to be treated, and in preparing himself for every successive step he was to make in his course, but to have no more in writing than the heads or short notes from which he was to speak, preparing himself, however, very diligently for every particular day's work. When his health gave way, in 1781, he wrote out his course, and during his retirement corrected it for the press and published it in 1792: " Principles of Moral and Political Science; being chiefly a retrospect of Lectures delivered in the College of Edinburgh." He confesses that he is partial to the Stoic philosophy, and acknowledges his obligations to Shaftesbury, Montesquieu, Harris, and Hutcheson. The work is divided into two parts, -- the first relating to the fact of man's progressive nature; the second, to the principles of right, or the foundations of judgment and choice. The sources of knowledge are consciousness, perception, testimony, and inference. Consciousness is the first and most essential attribute of the mind. To other animals, appetite continues to be the sole motive to action; and the animal in every moment of time proceeds on the motive then present. But to man, the repeated experience of gratification and crosses, like the detail of particulars in any other, is matter of generalization; he collects from thence the predicaments of good and evil, and is affected towards any particular object according as he has referred it to the one or the other. In unfolding his views, he has important remarks on the purposes served by abstraction. " The abstract form of an

operation is a physical law, and its application the constituent of physical science. The abstract form and expression of what is excellent or good is a moral law and principle of moral science." But " to whatever object we incline, or however we may have classed individual things in our conception of what is good or evil, it is proper to remember in this place that every effort of the mind is also individual and particular, relating to an object in some particular and individual situation." There is a hint here of a distinction between governing principles in their individual exercise and in their abstract form fashioned by the logical understanding, which might have cleared up a vast amount of confused discussion, had he carried it out. He adds: " The more general character {260} of man's inclinations or active dispositions is not a blind propensity to the use of means, but instinctive intimation of an end for the attainment of which he is left to discover and to choose by his own observations and experience the means which may prove most effectual." He starts questions which had been discussed by Aristotle, but which had been lost sight of by modern moralists, as to the ends by which man is swayed, and the importance in ethics of considering means and end, and for this gets an occasional commendation from Sir W. Hamilton. Believing in the progression of man, he would set before him no meaner end than the attainment of perfection, and places in this the principle of moral approbation, and for this he receives the commendation of M. Cousin. " We find in his method the wisdom and circumspection of the Scottish school, with something more masculine and decisive in its results. The principle of <perfection> is a new one, at once more rational and comprehensive than benevolence and sympathy, and which, in our view, places Ferguson as a moralist above all his predecessors." He thinks that he embraces all moral systems in his own, admitting, with Hobbes and Hume' the power of self-interest or utility, Hutcheson's benevolence and Smith's sympathy,-all helping progression, and tending towards perfection. All this sounds very lofty, and contains important truth, as we should all aim at our own perfection and that of the race, but leaves the question unsettled, what is this perfection to be, -- a perfection in felicity, as the final end, or a perfection in moral good: and what is the nature and criterion of moral good?

Ferguson's style and manner are not so subdued as those of the Scottish metaphysicians who preceded him. He has more of a leaping mode of composition, as if he had an audience before him, and is at times eloquent or magniloquent. I have an idea that, as Dugald Stewart drew his philosophy mainly from Reid, so he got his taste for social studies from Ferguson, who may also have helped to give him a livelier style, -- the academic dignity, however, being entirely Stewart's own.

In 1785, he resigned his professorial labors. He passed the remainder of his life in retirement, residing in various places, and living till 22d June, 1816. The following pen-and-ink sketch of the old man by Lord Cockburn, in the " Memorials {261} of his Time," brings him vividly before us: "His hair was silky and white; his eyes animated and light-blue; his cheeks sprinkled with broken red, like autumnal

apples, but fresh and healthy; his lips thin, and the under one curled. A severe paralytic attack had reduced his animal vitality, though it left no external appearance, and he required considerable artificial heat. His raiment, therefore, consisted of half-boots, lined with fur cloth breeches; a long cloth waistcoat, with capacious pockets a single-breasted coat; a cloth greatcoat, also lined with fur; and a felt hat, commonly tied by a ribbon below the chin. His boots were black, but, with this exception, the whole coverings, including the hat, were of a quaker-gray color, or of a whitish-brown; and he generally wore the furred greatcoat even within doors. When he walked forth, he used a tall staff, which he commonly held at arm's-length out towards the right side; and his two coats, each buttoned by only the upper button, flowed open below, and exposed the whole of his curious and venerable figure. His gait and air were noble; his gesture slow; his look full of dignity and composed fire. He looked like a philosopher from Lapland." I never heard of his dining out except at his relation, Joseph Black's, where his son, Sir Adam (the friend of Scott), used to say "it was delightful to see the two rioting over a boiled turnip. Domestically, he was kind, but anxious and peppery." "He always locked the door of his study when he left it, and took the key in his pocket , and no housemaid got in till the accumulation of dust and rubbish made it impossible to put the evil day off any longer, and then woe on the family."

XXXIII.-JAMES HUTTON.

H/E\ was the son of a merchant in Edinburgh, was born June 3, 1726, studied first in his native city, then in Leyden, where he took the degree of M.D., and devoted his life to agricultural pursuits and scientific investigations in chemistry, mineralogy, and specially in geology. He died March 26, 1797. He is best known as the author of a " Theory of the Earth," which was expounded in a clear and elegant manner by Playfair. He accounts for the present condition of the earth by the operation of a central heat; and there was long a contest between his theory and that of Werner, {262} who explains the formation of strata by water; geologists now find place for both agencies. It is not so generally known that he found much satisfaction in the pursuit of metaphysics, and is author of an elaborate work in three large quarto volumes, " An Investigation of the Principles of Knowledge, and of the Progress of Reason from Sense to Science and Philosophy." The work is full of awkwardly constructed sentences and of repetitions, and it is a weariness in the extreme to read it. Yet we are made to feel at times that these thoughts must be profound, if only we could understand them. He certainly speculates on recondite subjects, but does not throw much light on them. Knowledge is considered as consisting first of external information; secondly, of internal conception. In the first, mind is made to know no passion; in the second, it is made to known action." "Knowledge is no more the attribute of mind than mind is that of knowledge. We suppose that there is a substance called mind, and we then attribute knowledge to this substance; but knowledge is the very thing which in this case subsists. Space and time are conceptions of the

mind, founded upon activity and inactivity; that is to say, upon the volition of the mind, whereby either on the one hand action is produced that is change, or on the other hand inaction is ordained wherein the powers of the mind are preserved in a state of attention to the idea then in view." In his view of matter, he expounds a dynamical theory which becomes an ideal theory, closely approaching that of Berkeley. "There is no inert matter subsisting with magnitude and figure; but the external thing exists with moving and resisting powers." " Real solidity or impenetrability is truly a conception of our intellect, like that of equal lines and angles, but it is a supposition which nothing in nature authorizes us to make." " We deceive ourselves when we imagine that there is a subsisting independent of our thought, -- an external thing, which is actually extended and necessarily figured." " Figure is a thing formed in the mind alone, or produced by the proper action of our thinking substance." He says it is wrong to suppose that magnitude and figure subsist without our mind. He tells us that big theory agrees with that of Berkeley in this, that " figure and magnitude are not real and absolute qualities in external things; " but he holds that " there is truly an external existence as the cause of our knowledge," whereas Berkeley holds that there is no such external existence. We have here a view of matter very different from that of the Scottish school, who have commonly been inclined to the doctrine of Descartes. Metaphysical science will now have to set itself to determine what substantial truth there is in idealism, and, with the light of modern inquiries as to atoms, what truth there is in the dynamical theory of matter. {263}

XXXIV.-JOHN GREGORY.[74]

T/HE\ Gregorys are about as illustrious a family as Scotland has produced. Chalmers, in his " Biographical Dictionary," reckons no fewer than sixteen who have held British professorships. The founder of the family was James Gregory, the inventor of the reflecting telescope which bears his name. He became professor of mathematics in St. Andrew's, where he died in 1675, at the early age of thirty-six. He had a son James, who became professor of medicine in King's College, Aberdeen, and founded the school of medicine there. John, who merits a passing notice in our pages, was the son of this gentleman. He was born at Aberdeen in 1724, was educated there, occupied successively the chairs of philosophy and medicine, and, along with Reid, instituted the famous literary society. To this society he read essays, which were methodized and published in 1764, under the title, " Comparative View of the State and Faculties of Man with those of the Animal World." He considers the condition of man in a state of society under three different aspects; (1) in a savage state, where be is distinguished by his corporeal powers; (2) when the social affections and the heroic virtues appear; (3) where men have the means of acquiring wealth. and seek refinement and luxury. In treating of these topics he offers many thoughtful reflections. He remarks that men of refined genius must live in a manner abstracted from the world, that hence they are liable to cherish envy and jealousy; so there is perhaps less real friendship among authors than among the rest of

mankind. " Certain it is, virtue, genius, beauty, wealth, power, and every natural advantage one can be possessed of, are usually mixed with some alloy, while disappointing the fond hopes of their raising the possessor to any uncommon degree of eminence, and even in some measure bring him down to the common level of his species." He dwells fondly on taste, and remarks, " wherever what is denominated a very correct taste is generally prevalent, genius and invention soon languish." In treating of religion, he exhibits the rising spirit of his age. " The articles of religious belief falling within the comprehension of mankind are few and simple, but have been erected by ingenious men into monstrous Systems of metaphysical subtlety." "Speculative and controversial theology injure both the temper and affections." In the same year he removed to the wider field offered in Edinburgh, and became one of the ornaments of the brilliant literary circle there. Two years after he was appointed professor of the practice of medicine in the university, and was a very popular teachers He published a number of medical works, and left behind him when he died in 1773 a work composed after he lost his wife, "A Father's Legacy to his Daughter." It is characterized by calm wisdom, often somewhat worldly, and for long bad a large circulation. " Be ever cautious in {264} displaying your good sense. It will be thought you assume a superiority over the rest of the company. But if you happen to have any learning, keep it a profound secret, especially from the men, who generally look with a jealous and malignant eye on a woman of great parts and a cultivated understanding."

XXXV.-JAMES GREGORY

J/AMES\ G/REGORY\, the third of this name, was the son and the successor in the chair of medicine in Edinburgh of John Gregory. He was born in Aberdeen in 1753, and died in 1821. For many years lie stood at the head of his profession as a physician in Edinburgh. He published a number of medical works. His " Conspectus Medicinae Theoreticae," written in good Latin, was long used as one of the works on which the candidates for medical degrees were examined. He comes before us as author of " Philosophical and Literary Essays," dated Jan. 1St, 1790, and published 1792. He dedicates the work to Reid, and acknowledges that lie had taken a principal argument from one of Reid's observations in the essays on the " Intellectual Powers of Man." The most important essay is " On the difference between the Relation of Motive and Action and that of Cause in Physics, on Physical and Mathematical Principles." In an introduction in which he is long in coming to the point, he dwells on the looseness and ambiguity of the word "cause," and remarks that if" there should be occasion to attend to the more minute or specific differences among the several things comprehended under the genus 'cause,' it would be highly expedient or rather absolutely necessary to give to each of them a specific name, were it only an addition to the generic name cause." He has a glimpse of there being more than one agent involved in cause. "No substance is of itself a physical cause; this depends on its relation to some other substance, and implies the tendency to change in the latter." " The substance in which the change is observed is

considered as the subject, the other as the cause; and as change occurs generally in both or all of the substances so related, though it be not always of the same kind in them all, it depends on the circumstance of our attention being directed first and chiefly to one or other of them, and on our opportunities of observing the changes that occur in them, which of them we shall regard as the subject and which as the cause, as in the example of the communication and the loss of motion, of mutual gravitation, of the solution of salt and saturation of water, the melting of ice, or the boiling of water and the absorption of heat." This is a vague anticipation of the doctrine started in our day as to their being two or more agents in all material causation, -- a doctrine, I may add, not yet followed out to its consequences in regard to mechanical, chemical, and physiological action. He insists that there is in mind a certain independent self-governing power which there is not in body; in consequence of which there is a great difference between the relation of motive and action and that of cause {265} and effect in physics; and by means of which a person in all cases may at his own discretion act, either according to or in opposition to any motive or combination of motives applied to him; while body in all cases irresistible undergoes the change corresponding to the cause or combination of causes applied to it. " I propose to demonstrate the falsity and absurdity of the doctrine of necessity on mathematical principles, in mathematical form, partly by means of algebraic formulae, partly with the help of diagrams," and he uses mathematical formulae and others invented by himself. He endeavors to show by an indirect demonstration that the doctrine of necessity must be false, as it leads to false conclusions. He takes the case of a porter carrying a burden: " If a guinea should be offered for carrying it in the direction of A B, and half a guinea for carrying it in the direction A C, and let him be assured that if lie can earn the guinea he cannot earn the half guinea, and that if he earn the half guinea he cannot earn the guinea; will he go in the direction of A B or A C, or remain at rest in A? " He answers, that if the principle on which the necessity is founded be true, he must move in the diagonal A D. " But as it must be acknowledged that the porter will not move in that direction, experience proving the fact, then it follows that the law of physical causes and that of motives do not coincide, and that the relation between motives and actions is not necessary as between physical causes and their effects." Dr. Crombie attacked Dr. Gregory's reasoning, Sir W. Hamilton says "with much acrimony and considerable acuteness." There subsequently appeared letters from Dr. James Gregory, of Edinburgh, in defence of his essay on the " Difference of the Relation between Motive and Action and that of Cause and Effect in Physics; with Replies by the Rev. Alexander Crombie, LL.D." London: 1819. " It is much to be regretted that Dr. Gregory did not find leisure to complete his answer to Messrs Crombie, Priestley, and Co., of which five hundred and twelve pages have been printed, but are still unpublished." (Coll. Works of Reid, by Hamilton. p. 87.) We are reminded that the clearest defence by Reid of the doctrine of the freedom of the will is contained in letters to Dr. Gregory, and published in Hamilton's edition of his works. At a time when the Calvinistic faith of Scotland might have led

theologians into perilous necessarian doctrines, it was of great moment to have the essential liberty of will (which Calvin never denied) defended by such philosophers as Reid and Gregory.

XXXVI. -- ALEXANDER CROMBIE.

H/E\ was born in Aberdeen in 1760, and lived till 1842 He became a Presbyterian minister in London, and a schoolmaster at Highgate and afterwards at Greenwich. He wrote a number of educational works of value, as " Etymology and Syntax of the English Language," and "Gymnasium sive Symbola Critica." He has two philosophical works, gone on " Philosophical Necessity," dated Newington Green, 1793, and another on "Natural Theology," in 1829. In the preface to the first of these works, he tells us {266} that he was initiated in the principles of moral science by Dr. Beattie; that when he was a student in divinity the question was debated in a theological society, " Is man a free or necessary agent? " that he was then attached to the libertarian system, and continued to be so till he read Priestley's " Illustrations; " and that he was confirmed in the change of view by Hartley's " Observations." He answers Gregory's argument and illustration quoted above: "This demonstration of the essayist's is founded in error. It proceeds on the supposition that the two motives are not directly but indirectly repugnant, which is obviously false; any reconciliation between them being absolutely impossible." " If a guinea is offered to carry a letter ten miles east, and another to carry a letter ten miles south; and if I know I cannot earn both; if I know also that by taking any intermediate road I shall receive nothing, -- then my situation is precisely the same as if the directions, instead of being eastward and southward, had been to points diametrically opposite." He admits "that a necessarian, consistently with his principles, cannot feel that remorse which is founded on the conviction that he has acted immorally, and might have acted otherwise; but by the law of his nature he feels pain from that state of mind which is connected with a vicious conduct." "A necessarian should feel no remorse, no painful sentiment for any past action, as he knows it was necessary for general happiness." The opponents of necessity argue that these are the logical consequences of the system, in order to land it in a <reductio ad absurdum>: but scarcely any of the defenders have allowed this. It is evident that the necessity he expounds is very different from that of Edwards. His work on "Natural Theology" is a clear and judicious one. He argues that no metaphysical argument such as Clarke's, and no metaphysical principle such as Reid's common sense, can of itself prove the existence of God. The question is " Are or are there not conclusive proofs in the phenomena of nature that they must be productions of an intelligent author? " " Wherever we find order and regularity obtaining, either uniformly or in a vast majority of instances, where the possibilities of disorder are indefinitely numerous, we are justified in inferring from this an intelligent cause." He argues against materialism, and in favor of the immateriality of the soul

XXXVII. -- ARCHIBALD ARTHUR.

H/E\ was born at Abbot's Inch in the parish of Renfrew in 1774 , and died in 1797. He became assistant and successor to Dr. Reid, in the chair of moral philosophy, in Glasgow. There is a posthumous volume by him, entitled " Discourses on Theological and Literary Subjects," 1803, edited by Professor Richardson, and containing an account of his life. His views do not seem profound or original, but his style is elegant, and he has some good remarks on cause and effect and on beauty. {267}

XXXVIII. -- JOHN BRUCE.

H/E\ was born in 1744, and died in 1826. He published a little book for the use of his students,-" First Principles of philosophy, by john Bruce, A.M., Professor of Philosophy in the University of Edinburgh." It reached a second edition in 178 I-- It consists of mere notes or heads. Logic has a wide enough field: -- it is " the comprehensive science which explains the method of discovering and applying the laws of nature." He makes the sources of human knowledge to be sensation, understanding, and consciousness. He has another work, " Elements of the Science of Ethics, on the Principles of Natural Philosophy." He defines the moral faculty as " the power of perceiving the objects which regard the happiness or enjoyments of human nature." If we ask in what the physical law of gravitation consists, the answer is, in the uniformity of the effect in material nature. If we ask in what the moral law consists, the answer is, in the uniformity of the effect "that the observation of rights is the source of enjoyment." Mr. Bruce does not sound the depths of any subject of which he treats.

XXXIX-REVIEW OF THE CENTURY.

B/Y\ the close of the century, the fathers and elder sons of the family have passed away from the scene; and we may be profited by taking a glance at the work they have done. The Scottish metaphysicians have had an influence on their country, partly by their writings, but still more by the instruction which they imparted in the colleges to numerous pupils, afterwards filling important offices in various walks of life, and scattered all over the land. I cannot do better here than quote from the chapter in which M. Cousin closes his criticism of Reid. "By his excellencies as well as his defects, Reid represents Scotland in philosophy." "It would be impossible to write a history of Scotland in the last half of the eighteenth century, without meeting everywhere in the numerous and remarkable productions of the Scotch genius of this epoch, the noble spirit which that genius has excited, and which, in its turn, has communicated to it a new force. In face of the authority {268} of Hume, and despite the attacks of Priestley, the philosophy of common sense spread itself rapidly, from Aberdeen to Glasgow, and from Glasgow to Edinburgh; it penetrates into the universities, among the clergy, into the bar, among men of letters and men of the world; and, without producing a movement so vast as that of the German philosophy, it exercised an influence of the same

kind within narrower limits." We have the testimony of a succession of eminent men, to the effect that the chairs of mental philosophy, taken along with the essay writing which the professors holding these chairs demanded, exercised a greater influence than any others in the colleges and sent forth a body of youths capable of thinking, and of expressing their thoughts in a clear and orderly manner. From an old date, a reverence for the Roman law; and, at a later date, the judicial training of many youths in Holland had given a logical form to the pleadings at the Scottish bar, and the decisions of the bench: and now the philosophy widened the comprehension of the Edinburgh lawyers, and gave to their law papers a philosophical order scarcely to be found in those of England or Ireland.[75] The Scottish philosophy never attempted, as the German philosophy did (greatly to the injury of religion), to absorb theology into itself; but keeping to its own field, that of inductive psychology, it allowed the students to follow their own convictions, evangelical or rationalistic, but training all to a habit of skilful arrangement and exposition. It enabled and it led the theological professors to dwell on the relation between the truths of God's Word, and the fundamental principles of human nature; to lay a {269} deep and solid foundation for moral principle, to impart a moral tone to their teaching in divinity, and to expound, clearly and wisely, the arguments for the existence of God and the immortality of the soul. In the pulpit, it produced a thoughtful style of address, of which English and Irish hearers were wont to complain, as requiring from them too great a strain of thought. It fostered a habit of reasoning and discussion among educated men generally; and, through the ministers of religion and the parochial teachers, -- not a few of whom were college bred, -- it descended to the common people as a general intelligence and independence of spirit.

On literature the influence of the Scottish has not been so great as that of the German philosophy; but still it has been considerable, and altogether beneficent. All the professors paid great attention to style: they weeded out their Scotticisms with excessive care not a few of them were teachers of rhetoric; they exacted essays on the subjects lectured on, and sent forth a body of pupils capable of writing clearly and easily. Every one who has read their writings notices a style common to the whole Aberdeen school: it consists of simple sentences without strength or genuine idiom, but always limpid, calm, and graceful. It is worthy of being mentioned that, in the last quarter of the century, Edinburgh had a distinguished literary circle: embracing the historian Robertson; the preacher Blair; Mackenzie, the author of " The Man of Feeling; " such scientific men as Hutton, Black, Playfair, the Monros (father and son), and Cullen with the Gregories -- , and among them the metaphysicians, Hume, Smith, Ferguson, Monboddo, and Dugald Stewart, held a prominent place.

It has to be allowed that the original genius of Scotland was riot called forth by the Scottish philosophy, nor, it may be added, by the Scottish colleges. The truth is, it is not the province of colleges, or of education even, to produce originality: their function is to guide and

refine it. Robert Burns owed little to school training, and nothing to college learning; still such a man, with so much profound sense mingling with lust and passion, could have appeared only in a state of society in which there was a large amount of intelligence. His father was a thoughtful man, with a considerable amount of reading, and {270} the mother's memory was filled with Scottish songs. After mingling in the literary circle of Edinburgh, he testifies that he had found as much intelligence and wit among the jolly bachelors of Tarbolton, as among the polished men of the capital.[76] It is to the credit of the Scottish metaphysicians,-- such as Lord Monboddo, Ferguson, and Stewart, -- that they paid the most delicate attention to the young poet when he came to Edinburgh in 1786. He strove to understand the Scottish metaphysics with {271} only imperfect success.[77] Alison's, "Essay on Taste" made known to him the theory which refers beauty to association of ideas, and Burns yields his theoretical assent, while evidently doubting inwardly. He writes: " That the martial clangor of a trumpet had something in it vastly more grand, heroic, and sublime, than the twingle-twangle of a jew's-harp; that the delicate texture of a rose-twig, when the half-blown flower is heavy with the tears of dawn, was infinitely more beautiful and elegant than the upright stalk of the burdock, and that from something innate, and independent of all association of ideas, -- these I had set down as irrefragable orthodox truths until perusing your book shook my faith." It is an interesting circumstance that young Walter Scott met with Burns in Edinburgh, in the house of Adam Ferguson, and was struck with his dark, expressive eye, and with his combined humor and pathos. Scott did not owe much more than Burns to the Scottish philosophy. But he was a pupil of Dugald Stewart's, and may have owed to him and his college training, that power of clear exposition and order by which his prose works are distinguished above those of most men of high imaginative genius.[78]

It may be interesting at this point to look across the channel, and inquire what philosophy was doing on the continent. I begin with that country which was the ancient ally of Scotland. Both the Scotch and French philosophies professed to draw much from Locke; but they seized on very different elements. The Scotch followed him in his cautious spirit and {272} careful observation, but withstood from the beginning the rash hypothesis which derived all our ideas from sensation and reflection; and they called in, besides the external and internal senses, other senses as inlets, and in the end came to look upon them as being exercises of reason.[79] The French looked exclusively at the other side of Locke's philosophy, at the experiential side, carrying Locke's theory a stage farther; they left out reflection, made little use of observation, betook themselves to analysis, and exerted their ingenuity to derive all ideas from sensation. Condillac (born 1715, died 1786), made all man's ideas, even the highest, such as cause and moral good, transformed sensations. Most of his works were written for the purpose of helping to educate a prince of Parma, and the author did not mean to undermine morality or religion. But the logical consequences of error follow it unrelentingly, and are apt to come out in practical issues which the authors of it never contemplated. If Condillac did not see,

those who came after him clearly perceived that we could not, out of the mere materials supplied by the senses, extract, by any mental chemistry, the idea of moral obligation and of a spiritual God. Helvetius expounded a morality of self-interest; Cabanis evolved all thought out of organized matter, made the brain secrete thought as the liver secretes bile; D'Holbach showed that the issue was blank atheism; and licentious men and women were rejoicing in the thought that they had got rid of duty, of mind, and of God. The fruit of the whole was seen, not in the French Revolution, which was much needed, and would have come, with or without the philosophy, -- but in the direction which it took, and the atrocities which it perpetrated, and which caused it, unlike the English and American revolutions, to issue in a military despotism. By the close of the century, this philosophy had gone beyond ripeness to rottenness, and finer minds were turning away from it, and seeking for something better. The reaction started by Laromiguierre, and carried on more effectively by Royer Collard, and yet more so by his pupils Jouffroy and {273} Cousin, turned eagerly, as we shall see, towards the well-rounded philosophy of Reid and Stewart.

In Germany, philosophy took a very different direction. Leibnitz had opposed Locke and his experiential method, and had imparted a speculative spirit and an ideal elevation to the German thinking; and Wolf had labored to reduce the whole to logical forms. And now, as the offspring of the two, of idealism and formalism, the true German philosophy came forth from the brain of Emmanuel Kant, who was born 1724, died 1804, and published his great work, the "Kritik der reine Vernunft" in 1781, which took a considerably revised form in 1787. That philosophy was already taking firm hold of the German mind, and has not at this day lost its grasp, notwithstanding the efforts of Darwinism and materialism to loosen it. As it differed from the French, so it also differed from the Scotch. In a sense, indeed, Kant's philosophy was transplanted from the Scottish soil. Kant's grandfather named Cant, a saddler, emigrated from Scotland;[80] I and some think that he thence derived hereditarily his high conception of moral law: and he acknowledges that he was roused from his dogmatic slumbers by Hume's sceptical account of the relation of cause and effect But Reid and Kant, though both opposed to Hume, took up very different lines of defence. In respect of method, Reid followed the inductive method, with self-consciousness as the instrument of observation; whereas Kant inaugurated the critical method, as distinguished from the dogmatic method of Descartes on the one hand, and the empirical method of Locke on the other. The critical method takes upon itself to criticise all principles; but it can do so only by other principles, {274} avowed, or more frequently unavowed, -- and the question is started: How are these other principles to be judged? by other principles, and these by other principles without end? Or, if we must stop somewhere, the question is, Where? and, Why there? Every German metaphysician plants himself on his own stand-point, which he says cannot be disputed: but his neighbor disputes it or selects another; and there is a perpetual criticism, and an endless building, but without an undisputed foundation. In one respect, indeed, the two, the Scotch and German

philosophies, were alike: both stood up for principles which did not derive their authority from experience. But the Scottish metaphysicians discovered these by a careful inquiry into the operations of the human mind; Kant, by a process of logical discussion. On another point they differed: the Scottish metaphysicians make our primitive perceptions or intuitions look at realities -- , whereas Kant stands up for <a priori> principles, which regulate experience and have only a subjective validity. Having allowed idealism to enter, there was no means of arresting its career. As Kant had made time and space, substance and cause, mere forms in the mind, Fichte was only advancing a few steps farther on the same road when he made the whole universe a projection of the mind -- , and, in the succeeding age, Schelling made it an intellectual intuition, and Hegel a logical process. Even as the French sensationalism led to atheism, so the German idealism culminated in pantheism. Every one will allow that the German philosophy had a much more elevated character, and a much more elevating tendency, than the French. Its influence on the great body of the German people may not have been so great as that of the Scottish philosophy on the Scottish thought. On the other hand, its influence has been vastly greater on literature, to which it has imparted a high ideal character, as seen especially in the poetry of Germany, and of other countries which have borrowed from it. {275}

XL.-DUGALD STEWART.[81]

D/UGALD\ S/TEWART\ was born in the old college buildings, Edinburgh, on November 22, 1753. His father was Dr. Matthew Stewart, at one time minister at Roseneath, and afterwards successor to Maclaurin in the mathematical chair in Edinburgh, and still known as one of those British mathematicians, who were applying, with great skill and beauty, the geometrical method, while the continental mathematicians were far outstripping them by seizing on the more powerful instrument of the calculus. His mother was the daughter of an Edinburgh writer to the signet. He was thus connected on the part of his father (and also of his grandfather, who had been minister of Rothesay), with the Presbyterian ministry, and on the part of his mother with the Edinburgh lawyers, -- the two classes which, next to the heritors, held the most influential position in Scotland.

Dugald was a feeble and delicate infant. He spent his boyish years partly in Edinburgh, and partly in the maternal mansion-house of Catrine, which I remember as being, when I paid pilgrimage thither many years ago, a whitewashed, broad-faced, common-place old house, situated very pleasantly in what Wordsworth calls expressively the "holms of bonnie Ayr," but unpleasantly near a cotton-mill and a thriving village, which, as they rose about 1792, destroyed to Stewart the charms of the place as a residence. Stewart entered, at the age of eight, the High School of Edinburgh, where he had, in the latter years of his attendance, Dr. Adam for his instructor, and where he was distinguished for the elegance of his translations, and early acquired that love for the prose and poetical works of ancient Rome which continued with him through life. He entered Edinburgh College in the session 1765-66; that is, in his thirteenth

year. I remember that Bacon, David Hume, Adam Smith, Thomas Reid, and many other original-minded men, entered college about the same age; and I am strengthened in the conviction that, in order to {276} the production of fresh and independent thought, it is of ad vantage to have the drilling in the ordinary elements all over at a comparatively early age, and then allow the mind, already well stocked with general knowledge, to turn its undivided energies to its favorite and evidently predestinated field; and that the modern English plan of continuing the routine discipline in classics or mathematics till the age of twenty-two, while well fitted to produce good technical scholars, is not so well calculated to raise up great reformers in method and execution. What the Scottish colleges have to deplore is not so much the juvenility of the entrants-though this has been carried to excess -- as the total want of a provision for bringing to a point, for carrying on, for consolidating and condensing the scattered education which has been so well begun in the several classes. But to return to the college youth, we find him attending, among other classes, that of logic under Stevenson, for two sessions; that of moral philosophy under Adam Ferguson -- , that of natural philosophy under Russell: and from all of these he received a stimulus and a bent which swayed him at the crisis of his being, and abode with him during the whole of his life.

After finishing his course in Edinburgh, he went to Glasgow in 1771, partly by the advice of Ferguson, that he might be under Dr. Thomas Reid, and partly with the view of being sent to Oxford on the Snell foundation, which has been of use to many students of Glasgow, but has in some respects been rather injurious to the college; as it has led many to ascribe to it the mere reflected glory of being a training-school to higher institutions, whereas Glasgow should assert of itself that it is prepared to give as high an education as can be had in any university in the world. The youth seems at this time to have had thoughts of entering the Church of England; and if he had gone south, he would no doubt, in that event, have discharged the duties of the episcopal office with great propriety and dignity. But a destiny better suited to his peculiar character and gifts was awaiting him. In the autumn of 1772 -- that is, when he was at the age of nineteen -- he became substitute for his father in the chair of mathematics in Edinburgh. It is precisely such an office as this, a tutorship or assistant professorship, that the Scottish colleges should provide for their {277} more promising students; an office not to be reserved for sons or personal friends of professors, but to be thrown open to public competition. This is the one thing needful to the Scottish universities, to enable them to complete the education which they commence so well, and to raise a body of learned youths, ready to compete with the tutors and fellows of Oxford and Cambridge. In 1775, Mr. Stewart was elected assistant and successor to his father; in 1778, on Professor Adam Ferguson going to America as secretary to a commission, he, upon a week's notice, lectured for him on morals; and, in 1785, Ferguson having resigned, Stewart was appointed to the office for which he was so specially fitted, -- to the chair of moral philosophy in the university of Edinburgh.

We pause in the narrative, in order to look at the circumstances which combined to influence the youth, to determine his career, and to fit him for the good work which he performed. First we have a mind, not certainly of bright original genius, or of great intellectual force, but with a blending of harmonious qualities, a capacity for inward reflection, and a disposition toward it, a fine taste, and consummate judgment. From his youth he breathed the air of a college. He was early introduced to Roman literature, and made it his model. Stevenson used Wynne's " Abridgment of Locke's Essay " as a text-book, and from it the student may have caught the fresh and observational spirit which Locke had awakened, while, at the same time, he was kept from what Cousin describes as the common defect of the British philosophy -- being "insular" by the other text-books employed, namely, the "Elementa Philosophiae" of Heineccius, and the " Determinationes Ontologicae " of De Vries; works which discussed, in a more abstract and scholastic method, the questions agitated on the continent posterior to the publication of the philosophy of Descartes. A still greater influence was exercised over the youth by Ferguson, who, with no great metaphysical ability, but in an altogether Roman and in a somewhat pagan manner, discussed, with great majesty and sweep, the topics -- of which the pupil was ever after so fond -- lying between mental science on the one hand, and jurisprudence on the other. From his own father and through his own academical teaching, he acquired a taste for the Geometrical method, so well fitted to {278} give clearness and coherency to thought, and to teach caution in deduction. He thus became one of those metaphysicians (and they are not few) who have been mathematicians likewise, in this respect resembling (no, to go back to Thales, Pythagoras, and Plato, in ancient times) Descartes, Leibnitz, Samuel Clarke, Reid, and Kant. In the class of natural philosophy he was introduced to the Newtonian physics, which had been taught at an early date in Scotland, and caught an enthusiastic affection for the inductive method and for Bacon, which continued with him through life, and is his characteristic among metaphysicians. But the teacher influencing him most, and, indeed, determining his whole philosophic career, was Thomas Reid, who, in a homely manner, but with unsurpassed shrewdness, and great independence and originality, was unfolding the principles of common sense, and thus laying a foundation for philosophy, while he undermined the scepticism of Hume. Stewart has found in Reid the model instructor, and it may be added that Reid has found in Stewart the model disciple. This whole course was an excellent training for a metaphysician: it would have been perfect if, along with his knowledge of natural philosophy, his somewhat dull apprehension had been whetted by an acquaintance -- such as that of Locke in an earlier, and that of Brown in a later age -- with the more fugitive and complicated phenomena of the physiology of the body; and if, in addition, his over-cautious temper had been raised heavenward by an intimacy with the lofty spirit of Plato, or, better still, by an appreciation of the deep theological discussions which had collected around them so much of the English and Scottish speculative intellect of the two preceding centuries.

Like every other man not altogether self-contained, Stewart must have felt the spirit of his age, which, as coming in from every quarter, like air and sunshine, commonly exercises a greater influence on young men than individual teachers can possibly do through the special channels open to them. Hume had stirred the thoughts of thinkers to their greatest depths; and this was now the age in which Hume had to be met. Stewart was born fourteen years after the publication of the great sceptical work of modern times, the "Treatise on Human Nature" and two years after the publication of the {279} work from which all modern utilitarianism has sprung, the "Inquiry concerning the Principles of Morals." At the time when the youth was forming his convictions, Hume was living in Edinburgh, and the centre of an influence radiating round the man, who was a mixture of the lively, good-natured animal and of the intellectual giant, but with a terrible want of the high moral and spiritual. The original disposition of Stewart did not tempt him to daring speculation; his domestic training must have prepossessed him against infidelity; and he had been placed, in Glasgow, under the only opponent worthy of Hume, who had appeared; and so these earthquake shocks just made him look round for a means of settling fast the foundations of the temple of knowledge.

Locke's philosophy had been the reigning one for the last age or two. Mr. Vetch speaks of the " tradition of sensationalism, which the Scottish universities during the first half of the century, and up to the time of Reid, had in general dispensed in Scotland." This statement is too sweeping: for, first, Locke had given as high a place to reflection as to sensation; and, secondly, he had given a high office to intuition; while, thirdly, Locke's philosophy had not been received in Scotland without modification, or in its worst aspects, as it had been in France. Stewart, like Reid, entertained a high admiration of Locke, and was unwilling to separate from him, but he saw at the same time the defects of Locke, and that there were fundamental laws in the mind which Locke had overlooked, or only incidentally noticed. In Glasgow he must have felt the influence left behind by a train of eminent men. There Hutcheson had been the founder of the genuine Scottish school. In Glasgow, too, Adam Smith had expounded those original views which he afterwards published in his " Theory of Moral Sentiments " and his " Wealth of Nations." In order to estimate the character of the age, it must also be taken into account that there was a strong expectation that results were to follow, from the application of inductive science, to mental phenomena, similar to those which had flowed from its application to physics. Turnbull's aim was to " apply himself to the study of the human mind, in the same way as to that of the human body, or to any other part of natural philosophy." Catching this spirit, Reid was even now employing it to discover {280} principles deeper than any that had been systematically noticed by Locke, by Hutcheson, or any Scottish philosopher. To this same noble work Stewart now devoted himself; but seeking, meanwhile, to combine with the profound philosophy of Reid a literary excellence like that of Hume and Smith.

And this leads us to notice that we cannot form any

thing like an adequate idea of the influences which combined to mould the character of Stewart, who cultivated literature as eagerly as he did philosophy, without taking into account that he lived in an age of great literary revival in Scotland. The union between Scotland and England being now compacted, it was seen that the old Scottish dialect must gradually disappear; and ambitious youths were anxious to get rid of their northern idioms, and even grave seniors, including noblemen and dignified doctors, like Robertson (as we learn from Lord Campbell's "Life of Loughborough"), had formed a society, in order to be delivered from their Scottish pronunciation. A company of authors had sprung up, determined to assert their place among the classical writers of England; and this had been already allowed to Hume, to Robertson and Smith, and was being allowed to Beattie. Stewart had, no doubt, an ambition to take his place among the classical writers of Scotland.

While pursuing his studies at Glasgow, he read a paper on "Dreaming" before a literary society in connection with the university; and he subsequently read the same paper to a similar society in Edinburgh. The theory here started was afterwards embodied in his " Elements," and contains certainly not the whole truth on this mysterious subject, but still a truth, namely, that in dreaming the will is in abeyance, and the mind follows a spontaneous train. In the Edinburgh society he also read papers on " Taste," on " Cause and Effect," and " Scepticism." The fact that such topics were discussed is a sign of the spirit which prevailed among the youth of Scotland at that time. It is worthy of being noticed that at Glasgow he boarded in the same house with Mr. Alison, who afterwards, in his essay on " Taste," carried out the theory which had been started by Beattie in his " Dissertation on Imagination," as to the feeling of beauty being produced by the association of ideas.

Quitting his course of training, we may now view him as delivering his professorial lectures in the class-room in Edinburgh. {281} By far the liveliest account of him is by Lord Cockburn. It is worthy of being read again by those who may have seen it before.

> " He was about the middle size, weakly limbed, and with an appearance of feebleness which gave an air of delicacy to his gait and structure. His forehead was large and bald; his eyebrows busily; his eyes gray and intelligent, and capable of conveying any emotion from indignation to pity, form serene sense to hearty humor, in which they were powerfully aided by his lips, which, though rather large perhaps, were flexible and expressive. The voice was singularly pleasing; and, as he managed it, a slight burr only made its tones softer. His ear both for music and for speech was exquisite; and he was the finest reader I have ever heard. His gesture was simple and elegant, though not free from a tinge of professional formality, and his whole manner that of an academic gentleman.... He lectured standing, from notes which, with their successive additions, must, I suppose, at last have been nearly as full as his spoken words. His lecturing

manner was professorial, but gentlemanlike, calm and expository, but rising into greatness, or softening into tenderness, whenever his subject required it. A slight asthmatic tendency made him often clear his throat; and such was my admiration of the whole exhibition, that Macvey Napier told him not long ago that I had said there was eloquence in his very spitting, I Then,' said he, I am glad there was at least one thing in which I had no competitor.' . . To me, his lectures were like the opening of the heavens. I felt that I had a soul. His noble views, unfolded in glorious sentences, elevated me into a higher world."

There were hearers who felt that there was a want in his expositions, and there are readers still who feel in the same way. Ardent youths, like Brown and Chalmers, looked on him as timid and over-cautious. Chalmers wrote in 1801: " I attend his lectures regularly. I must confess I have been rather disappointed. I never heard a single discussion of Stewart's which made up one masterly and comprehensive whole. His lectures seem to me to be made up of detached hints and incomplete outlines, and he almost uniformly avoids every subject which involves any difficult discussion." Chalmers lived to proclaim him the highest of academic moralists. Still there was ground, in appearance and in reality, for the early criticism. In his writings he adopts the plan which Dr. Robertson took credit for introducing, that of throwing a great deal of his matter into notes and illustrations. This method, carried to the extent to which it has been done by Robertson, Stewart, and M'Crie, is a radically defective one, as it interrupts the flow of {282} the discourse, and, with this, the interest in and comprehension of the whole. He has a most sensitive aversion to all such bold speculations as Leibnitz indulged in, and is jealous of all such consecutive deductions as Descartes and Kant have drawn out. He has no ability for sharp analysis, and he looks on a high abstraction with as great terror as some men do on ghosts. He studiously avoids close discussion, and flinches from controversy; he seems afraid of fighting with an opponent, lest it should exhibit him in no seemly attitudes. Seldom does he venture on a bold assertion, and, when he does, he takes shelter immediately after behind an authority. Determined to sustain his dignity and keep up his flow of language, he often takes rounded sentences and paragraphs to bring out what a more direct mind would have expressed in a single clinching clause, or even by an expressive epithet. Often does the eager, ingenuous youth, in reading his pages, wish that he would but lay aside ceremony for a very little, and speak out frankly and heartily.

Still we should form a very unjust opinion of Stewart, if, in consequence of weaknesses, we thought him devoid of originality, independence, or profundity. We certainly do not claim for him the sagacity of Locke, or the speculative genius of Leibnitz, or a power of generalizing, details equal to Adam Smith, or the shrewdness of Reid, or the logical grasp of Kant and Hamilton, and I admit that he was inferior to all these men in originality; but he has admirable qualities of his own, in soundness of judgment he is more to be trusted than any of them; and, if he is

without some of their excellencies, he is also without some of their faults. He has no such rash and unmeasured diatribes as Locke's assault on innate ideas; no such extravagances as the monadical theory of Leibnitz; no such wasting of ingenuity as Smith's theory in his " Moral Sentiments; " he does not commit such gross misapprehensions in scholarship as Reid does; and he never allows any logic to conduct him to such preposterous conclusions as Kant and Hamilton landed themselves in, when they declared causation to be a law of thought and not of things. I have noticed that in many cases Stewart hides his originality as carefully as others boast of theirs. Often have I found, after going the round of philosophers in seeking light on some abstruse subject, that, on {283} turning to Stewart, his doctrine is, after all, the most profound, as it s the most judicious.

I do not mean to enter into the details of his remaining life. In 1783, he married a Miss Bannatyne of Glasgow, who died in 1787, leaving an only child, afterwards Colonel Stewart. He spent the summers of 1788 and 1789 on the Continent. In the appendix to the Memoir, there is a selection from the letters which he wrote to his friends at home. Though written in the midst of instructive scenes, and on the eve of great events, they are excessively general and common-place, and display no shrewdness of observation. In 1790, he married a daughter of Lord Cranston, a lady of high accomplishments, fascinating manners, and literary tastes. His house now became the resort of the best society of Edinburgh, and he himself the centre and bond of an accomplished circle, at a time when the metropolis of Scotland in the winter months was the residence of many of the principal Scottish families, and of persons of high literary and scientific eminence. The weekly reunions in his house, which happily blended the aristocracies of rank and letters, bringing together the peer and the unfriended scholar, were for many years the source of an influence that most beneficially affected the society of the capital. His influence was extended by his receiving into his house, as boarders, young men chiefly of rank and fortune. In his classes of moral philosophy and of political economy, he had under him a greater body of young men who afterwards distinguished themselves, than any other teacher that I can think of. Among them we have to place Lord Brougham, Lord Palmerston, Lord John Russell, Francis Horner, Lord Lansdowne, Francis Jeffrey, Walter Scott, Sydney Smith, Thomas Brown, Thomas Chalmers, James Mill, Archibald Alison, and many others who have risen to great eminence in politics, in literature, or philosophy; and most of these have acknowledged the good which they derived from his lectures, while some of them have carried out in practical measures the principles which he inculcated. He seems, in particular, to have kindled a fine enthusiasm in the breast of Francis Horner, who ever speaks of him in terms of loftiest admiration, and, though cut off in early life, lived long enough to exhibit the high moral aims which he had imbibed from the lessons of Stewart. {284}

It was in 1792 that the first volume of his "Elements" was published. In 1793, appeared his " Outlines of Moral Philosophy," containing an epitome of the doctrines expanded

in his larger writings. His other works appeared after successive intervals: his Account of Adam Smith in 1793, of Robertson in 1796, and of Reid in 1802; his "Philosophical Essays" in 1810; the second volume of his "Elements" in 1814; the first part of his Dissertation, in 1815, and the second in 1821; the third volume of his "Elements" in 1827; and the "Active and Moral Powers" in 1828. The lectures on Political Economy, were not published till 1856.

In 1805, he threw himself, with more eagerness than he was wont to display in public matters, into the controversy which arose about the appointment of Leslie -- a man of high scientific eminence, but with a great deal of the gross animal in his nature-to the chair of mathematics. He wrote a pamphlet on the subject, and appeared in the General Assembly of the Church of Scotland, as a Presbyterian elder, to aid the evangelical party, who, under the leadership of Sir Henry Moncreiff, were no way inclined to join the moderate party in their attempt to keep out a distinguished man, because he entertained certain views on the subject of physical causation, and to retain the college chairs for themselves. In his speech on the occasion, Stewart does let out feeling for once, and it is mingled pride and scorn. " After having discharged for more than thirty years (not, I trust, without discredit to myself) the important duties of my academical station, I flatter myself that the House does not think it incumbent on me to descend to philosophical controversies with such antagonists. Such of the members, at least, as I have the honor to be known to, will not, I am confident, easily allow themselves to be persuaded that I would have committed myself rashly and wantonly on a question in which the highest interests of mankind are involved." In delivering the speech from which the above is an extract, he was called to order, and, not being accustomed to such handling, he sat down abruptly. The motion of Sir Henry Moncreiff was carried by a majority, which occasioned great joy to the Edinburgh Liberals, and helped to sever the connection between the universities and the church.

In 1806, the Whig party, being in power, procured for him a sinecure {285} office, entitled the writership of the "Edinburgh Gazette," with a salary Of 300l. a year. In 1809, he was in a precarious state of health, much aggravated by the death of a son by his second wife, and he asked Dr. Thomas Brown to lecture for him. In 1810, Brown, being strongly recommended to the Town Council by Stewart, was appointed conjoint professor, and henceforth discharged all the duties of the office. Brown never attacked Stewart, but he openly assailed Reid; and we suppose the intimacy between Stewart and Brown henceforth could not have been great. Stewart delivered his ultimate estimate of Brown in a note appended to the third volume of the " Elements." There is evidently keen feeling underlying it; but the criticism is, on the whole, a fair and just one. Stewart now lived, till the close of his life, at Kinniel House, Linlithgowshire, -- a residence placed at his service by the Duke of Hamilton Henceforth he was chiefly employed in maturing and arranging the philosophical works which he published. The details given of this part of his life are scanty and uninstructive. In 1820, he came forth to support Sir James Mackintosh as

successor to Brown; and when Sir James declined the office, Stewart recommended Sir William Hamilton, who seems ever afterwards to have cherished a feeling of gratitude towards Stewart. The election fell on Professor Wilson, who, while the fittest man living for the chair of rhetoric and belles-lettres, had no special qualifications for a chair of philosophy.

In 1822, Mr. Stewart had a stroke of paralysis, from which, however, he partially recovered. Mrs. Stewart describes him, in 1824, as troubled with a difficulty of speech, and a tremor in his hand, as walking two or three hours every day, as cheerful in his spirits, his mind as acute as ever, and as amusing himself with reading on his favorite pursuits, and with the classics. He had just given to the world his work on the "Active Powers," and was on a visit to a friend in Edinburgh, when he died on 11th June, 1828. He was buried in the family vault in the Canongate. There is a monument in honor of him on the Calton Hill; but the fittest memorial of him is to be found, first, in his pupils, who have done a good work in their day, and now in his writings, which may do a good work for ages to come. {286}

His collected works have been edited by Sir William Hamilton. The editor has not enriched it with such notes as he has appended to his edition of Reid, -- notes distinguished for the very qualities which Reid was deficient in, extensive scholarship and rigid analysis. Sir William Hamilton, in undertaking the work, stipulated that Mr. Stewart's writings should be published without note or comment. I rather think that Hamilton had not such a sympathy with the elegant and cautious disciple as with the shrewd and original master. Besides, elaborate notes to Stewart must have been very much a repetition of his notes to Reid. In this edition Hamilton is tempted at times to depart from his rule: he does give us a note or comment when the subject is a favorite one, such as the freedom of the will; and often must he have laid a restraint on himself, in not pruning or amending to a greater extent. .But the value of this edition consists in its being complete, in its having references supplied, and one index after another, and in its containing additions from Stewart's manuscripts, and these often of great value, both in themselves and as illustrating Stewart's philosophy. Sir William Hamilton was cut off before the edition was completed, but Mr. Vetch has carried on the work in the same manner and spirit. Having said so much of this fine edition, we must protest against the occasional translation of the language and views of Stewart into those of Hamilton, in places where it is purported to give us Stewart himself. Thus, in index, vol. iv., p. 408, Stewart is represented as, in a place referred to, discussing the question as to whether some of our notions be not " native or a priori," but, on looking up the page, no such language is used; and the same remark holds good of vol. v., P. 474, where Stewart is spoken of as describing our notions both of matter and mind as merely " phenomenal," a view thoroughly Kantian and Hamiltonian, and not sanctioned by Stewart. I must be allowed, also, to disapprove of the liberty taken with the " Outlines of Moral Philosophy," which is cut up into three parts, and appears

in three distinct volumes. This is the most condensed and direct of all Stewart's writings: it contains an abridgment of his whole doctrines; it is one of the best text-books ever written, and it should have appeared in its unity, as Stewart left it. {287}

I do not propose to criticise these ten massive volumes of his works. This would be a heavy work to my readers: it would almost be equivalent to a criticism of all modern philosophy. Nevertheless, I must touch on some topics of an interesting and important kind, as discussed by Stewart, and again discussed by later writers on mental science.

The first volume of the collected works contains the " Dissertation on the Progress of Metaphysical and Ethical Philosophy." I look upon it as the finest of the dissertations in the " Encyclopaedia Britannica " -- , and this is no mean praise, when we consider the number of eminent men who have written for that work. I regard it, indeed, as, upon the whole, the best dissertation which ever appeared in a philosophical serial. As a history of modern philosophy, especially of British philosophy, it has not been superseded, and, I believe, never will be set aside. It is pre-eminent for its fine literary taste, its high moral tone, its general accuracy, its comprehensiveness of survey, and its ripeness of wisdom. When we read it, we feel as if we were breathing a pure and healthy atmosphere, and that the whole spirit of the work is cheering, as being so full of hope in the progress of knowledge. Its critical strictures are ever candid, generally mild, very often just, and always worthy of being noted and pondered. The work is particularly pleasing in the account given of those who have contributed by their literary works to diffuse a taste for metaphysical studies, such as Montaigne, Bayle, Fontenelle, and Addison. It should be admitted that the author has scarcely done justice to Grotius, and failed to fathom the depth of such minds as Leibnitz and Jonathan Edwards. I agree, moreover, with those who regret that he should ever have been tempted to enter on a criticism of Kant, whose works he knew only from translations and imperfect compends.

The next three volumes contain the" Elements of the Philosophy of the Human Mind," and are introduced by a portion of the " Outlines of Moral Philosophy." In the first volume of the "Elements" and in the opening of the second, he spreads out before us a classification of the intellectual powers, -- as perception, attention, conception, abstraction, association of ideas, memory, imagination, and reason. The list is at once defective and redundant. Stewart acknowledges self-consciousness, {288} which is an inseparable concomitant of all the present operations of the mind, to be a separate attribute; and in this he seems to be right, inasmuch as it looks at a special object, namely, self in the existing state, and gives us a distinct class of ideas, namely, the qualities of self, such as thinking and feeling. Yet it is curious that, while he gives it half a page in his " Outlines," it has no separate place in the "Elements." It is also a singular circumstance that Reid dismisses it in the same summary way. An inductive observation, with an analysis of the precise knowledge given us by self-consciousness, would give a solid foundation for

the doctrine of human personality, and clear away the greater part of the confusion and error lingering in the metaphysics of our day. Nor is there any proper account given in the " Elements " of that important group of faculties which discover relations among the objects known by sense-perception and consciousness. The omission of this class of attributes has led him into a meagre nominalism, very unlike the general spirit 'of his philosophy. He restricts the word conception to the mere imaging power of the mind, and even to the picturing of bodily objects, as if we could not represent mental objects as well, as, for example, ourselves or others in joy or sorrow. In a later age, Hamilton has confined the term in an opposite direction to the logical or general notion. Stewart's classification is also redundant. Attention is not a separate faculty, but is an exercise of will, roused, it may be, by feeling, and fixing the mind on a present object. He does not seem to know what to make of reason as a distinct faculty; and, as defined by him, it ought to include abstraction, which is certainly a rational exercise. But, if the work is defective in logical grasp, it excels in its descriptions of concrete operations, and in its explanations and elucidations of phenomena presenting themselves in real life. All his works are replete with those "intermediate axioms " which Bacon commends as most useful of all, as being removed equally from the lowest axioms, which differ but little from particulars, and from the highest and most general, which are notional, abstract, and of no weight; whereas the " intermediate are true, solid, full of life, and upon them depend the business and fortune of mankind." The fine reflection and lofty eloquence of Stewart come out most pleasingly and instructively {289} in all those passages in which he treats of association and imagination.

On one important point, discussed frequently in the " Elements," the school of Reid and Stewart was led into error by their excessive caution, and by being awed so much by the authority of Locke. Reid maintained in a loose way, that we do not know substance, but qualities; and Stewart wrought this view into a system. We are not, he says, properly speaking, conscious of self or the existence of self: we are conscious merely of a sensation or some other quality, which, by a <subsequent suggestion of the understanding>, leads to a belief in that which exercises the quality. -- (" Phil. Essays," P. 58, etc.) This I must regard as a radically defective doctrine. We do not know intuitively a quality of self apart from self; we know both in one primitive, concrete act, and it is only by a subsequent operation that we separate in thought the quality which may change in its action from the self or substance which abideth. Descartes erred I think, when he represented the mental process as being "<cogito, ergo sum>:" the primitive cognition is of the ego cogitans. But I look on Stewart as equally erring when he says, that there is first a sensation and then a belief in self. In a later age, Sir William Hamilton connected the <qualitative> theory of Stewart with the <phenomenal> theory of Kant. In doing so he was guilty, I must take the liberty of saying of a great and inexcusable blunder. Stewart would have repudiated the phenomenal theory of Kant as at all identical with his own. Stewart, no doubt, speaks of the phenomena of the mind; but he means by

phenomena not, as Kant did, <appearances>, but individual <facts> to be referred to a law; and qualities with him were realities. But, legitimately or illegitimately, Hamilton identifying the qualitative theory with the phenomenal, deduces from them a system of relativity, which ended in nihilism, or at least in nescience. I am glad to notice that Mr. Mansel, notwithstanding his great and just admiration of Hamilton, has emancipated himself from this fundamental error. He proclaims, " I am immediately conscious of myself, seeing and hearing, willing and thinking." -- (" Proleg. Logica," P. 129; also Art. <Metaph.> in " Encyc. Brit."'. I have sometimes thought that, if Stewart had foreseen ail the logical consequences to be deduced from his views, he would have fallen {290} back on the same common-sense doctrine. I regret that Mr. Mansel has not gone a step farther, and placed our cognition of matter on the same footing in this respect as our knowledge of mind. I am sure, at least, that this would be altogether in the spirit of Reid and Stewart. I maintain that, just as by self-consciousness we know self as exercising such and such a quality, say thinking or feeling, so, by sense-perception, we know a body as extended and exercising power or energy. This is the simplest doctrine: it seems to be the only one consistent with consciousness, and is the proper doctrine of natural realism as distinguished from an artificial system of relativity.

In the second volume of the " Elements," after a feeble and chiefly verbal disquisition on reason, he proceeds to treat of the "fundamental laws of belief." I reckon the phrase a very happy one, and a great improvement on "common sense," which labors under the disadvantage of being ambitious; inasmuch as it usually denotes that unbought, untaught sagacity, which is found only in certain men, and which others can never acquire, whereas it can be admitted into philosophical discussion only when it denotes principles which are regulating the minds of all. I have a remark to make as to the place in which he discusses these fundamental laws. It is after he has gone over the greater number of the faculties, and he seems to treat them as involved in reason. And I acknowledge that there may be some advantages in first going over the faculties and then speaking of these fundamental laws. But we must guard against the idea that these principles are not involved in the faculties which he has previously gone over; such as, perception, abstraction, and memory. The "fundamental laws" are not to be regarded as different from the faculties: they are, in fact, the necessary laws of the faculties, and guiding their exercise. These laws work in all minds, infant and mature, sane and insane. M. Morel was asked to examine a prisoner who seemed to be deranged, and he asked him how old he was; to which the prisoner replied: " 245 francs, 35 centimes, 124 carriages," etc. To the same question, more distinctly asked, he replied,: " 5 metres, 75 centimetres." When asked how long he had been deranged, he answered: "Cats, always cats." M. Morel at once declared his madness {291} to be simulated, and states: " In their extreme aberrations, in their most furious delirium, madmen do not confound what it is impossible for the most extravagant logic to confound. There is no madman who loses the idea of cause, of substance, of existence." (See " Psychol. Journal," Oct. 1857.)

Stewart's doctrine of causation seems to me to be deficient and inadequate. He is altogether right in calling it a fundamental law of belief, which necessitates the mind to rise from an effect to a cause. But he does not seem to observe all that is involved in the cause. He gives in too far to Hume on this subject, and prepares the way for Brown's theory. He does not see, in particular, that causation springs from power being in the substance or substances which act as the cause, and that we intuitively discover power to be in substances both mental and material. His distinction between efficient and physical cause is of a superficial and confused character. It may be all true that, in looking at physical action, we may not know intuitively where the full efficiency resides, whether in the physical object alone or in mind (the divine) acting in it; but we are certain that there is an efficiency somewhere in some substance. I am by no means sure that he is right in limiting power in the sense of efficiency to mental action. I agree here with the criticisms of Cousin (as indeed I agree with most of the criticisms of Cousin on the Scottish school) where he says that, while our first idea of cause may be derived from our own voluntary action, we are at the same time intuitively led to ascribe potency to other objects also -- , and that Reid and Stewart, in denying that we discover efficiency in body, are acting contrary to their own principles of common sense, and in contradiction to the universal opinion of the human race, which is, that fire burns and light shines. (See Cousin, " Phil. Ecoss.," P. 437, ed. 1857.) Stewart has also failed, as it appears to me, to give the proper account of the intuition which regulates and underlies our investigations of nature. This is not, as he represents it, a belief in the uniformity of nature; a belief which appears to me to be the result of experience, which experience, as it discovers the rule, may also announce the exceptions. The child does not believe, nor does the savage believe, nature to be uniform. The underlying beliefs, which carry us on in our investigations of nature are those of identity, {292} of being, of substance and quality, of cause and effect. Hence it is quite possible to prove a miracle which may not be in conformity with the uniformity of nature, but is quite compatible, as Brown has shown, with our intuitive belief in causation for when creature power fails we can believe in creative.

It is in the second volume of the " Elements " that we find the logical disquisitions of Stewart. He has utterly failed in his strictures on Aristotle's logic. The school of Locke, and the school of Condillac, and the school of Reid, have all failed in constructing a logic of inference which can stand a sifting examination. The Aristotelian analysis of reasoning stands at this moment untouched in its radical positions. The objections of Campbell and Stewart have been answered by Whately, who shows that the syllogism is not a new or peculiar mode of reasoning, but an analytic of the process which passes through the mind when it reasons. In giving an adherence to the Aristotelian analysis, I admit that improvements were wrought in it by that school of logicians which has sprung from Kant, and of which Hamilton was the leader in Great Britain, followed by such eminent

men as Mansel, Thomson, and Spalding. But their improvements ought not to be admitted till the formal logicians thoroughly deliver their exposition of the laws of thought from all that false Kantian metaphysics which represents thought as giving to the objects a " form " which is not in the objects themselves. Besides, I cannot allow logic to be an <a priori> science except under an explanation: I admit that the laws of thought operate in the mind prior to all experience; but I maintain that they can be discovered by us only <a posteriori>, and by a generalization of their individual actings.

But while we may thus expect a perfected universal logic, treating of the laws of thought as laws of thought, -- not independent of objects, but whatever be the objects, -- I hope there will grow up alongside a particular logic, which will be a more practically useful logic, to consider the laws of thought as directed to particular classes of objects, and to treat of such topics as demonstrative and probable evidence, induction, and analogy. In regard to this latter logic, Stewart must ever be referred to as an authority. So far, indeed, as the theory of definitions and axioms is concerned, I prefer very much the view of Whewell, as developed in his " Philosophy of the Inductive {293} Sciences." But, in regard to induction, I believe that Stewart's account of it is, upon the whole, the best which appeared from the time of Bacon down to his own age. Since his time, we have two great works, which have left every other far behind, -- that of Whewell and that of Mr. John Stuart Mill. Not that I regard either of these as perfect. Dr. Whewell has exaggerated the place of the mental element, and has expressed it in most unfortunate phraseology, such as " fundamental ideas " and " conceptions," terms which have been used in twenty different significations, and are used by him to denote that the mind superinduces on the facts something not in the facts, whereas the mental power merely discovers what is in the facts. Mr. Mill, on the other hand, has overlooked the mental element altogether, and denies all necessary and universal truth. We may hope, in future years, to have a perfect inductive logic by a judicious combination of these two works but this can be done only by a man of the same high intellectual stature as Whewell and Mill, and this will seldom be met with. It is to be regretted that, since the days of Stew art, there is not a single Scotchman who has presented a work on induction, of any name or value.[82] In regard to analogy, the discoveries as to the typical forms of animals and plants and evolution will enable logicians to give a far more comprehensive and yet more stringent view of reasoning from analogy than has been done by Stewart, by Whewell, or by Mill.

The third volume of the " Elements " treats of certain concrete and practical matters, which Stewart was peculiarly qualified to discuss, and which bring out some of the finer qualities of his mind. All his disquisitions had tended to become verbal; and here he treats expressly of languages which he does with fine discernment, but falls into a great blunder in regard to {294} Sanscrit, which he represents as of comparatively late origin, and analogous to mediaeval Latin, whereas it has a literature reaching back at least twelve hundred years before Christ. He has some interesting,

though by no means profound, remarks on the sympathetic affections. But by far the finest parts of the volume are those in which he treats of the varieties of intellectual character, and of the peculiarities of the metaphysician, the mathematician, the poet, and the sexes. Thus, of the mere metaphysician, he says, that, " he cannot easily submit to the task of examining details, or of ascertaining facts, and is apt to seize on a few <data> as first principles, following them out boldly to their remotest consequences, and afterwards employing his ingenuity to reconcile, by means of false refinements, his theoretical assumptions with the exceptions which seem to contradict them." He shows that the metaphysician is safe from the checks met with in physics, "where speculative mistakes are contradicted by facts which strike our senses." Again, of mathematics, he says, " that, while they increase the faculty of reasoning or deduction, they give no employment to the other powers of the understanding concerned in the investigation of truth." He adds: " I have never met a mere mathematician who was not credulous to excess."

In the same volume he discusses cautiously and judiciously the comparison between the faculties of man and brutes. I suspect, however, that the theory has not yet been devised it has certainly not been published -- which is fitted to give a satisfactory account of the relation of the brute to the human faculties. I suppose that Bonnet is right when he says that we shall never be able to understand the nature of brute instinct, till we are in the dog's head without being the dog. It is certain that we have at this moment nothing deserving of the name of science on this subject. I have sometimes thought that the modern doctrine of homologues and analogues, if extended and modified to suit the new object, might supply the key to enable us to express some of the facts. Certain of the brute qualities are merely analogous to those of man (as the wing of a butterfly is analogous to that of a bird); others are homologues, but inferior in degree; while there are qualities in man different in kind from any, in the brute. Aristotle called brute instincts, [Greek quote]. They would be more accurately described as anticipations or types of the coming archetype. {295} The volume closes with an account of James Mitchell, a boy born blind and dumb.

The " Philosophical Essays " are an episode in his system as a whole, even as his numerous notes and illustrations are episodes in the individual volumes. I am tempted, in looking at them, to take up two of the subjects discussed, as a deep interest still collects around them, and the questions agitated cannot yet be regarded as settled.

Every careful reader of Locke's "Essay" must have observed two elements running through all his philosophy, -- the one, a sensational, or rather to do justice to Locke, who ever refers to reflection as a separate source of ideas, an experiential element, and the other a rational. In the opening of the " Essay" he denies innate ideas apparently in every sense, and affirms that the materials of all our ideas are derived from sensation and reflection; but, as he advances, his language is, that by these sources ideas are

"suggested and furnished to the mind" (the language adopted by Reid and Stewart); he calls in faculties with high functions to work on the materials; speaks of ideas which are "creatures and inventions of the understanding;" appeals to "natural law" and the "principles of common reason; "and in the Fourth Book gives a very high, or rather deep, place to intuition; says we have an intuitive knowledge of our own existence; speaks of the " mind perceiving truth as the eye doth light, only by being directed toward it;" declares that, in the "discovery of and assent to these truths, there is no use of the discursive faculty, no need of reasoning, but they are known by a superior and higher degree of evidence," and talks even of a " necessary connection of ideas." It unfortunately happened that in France, to which Locke was introduced by Voltaire and the encyclopedists, they took the sensational element alone, and the effect on thought and on morality was most disastrous. Unfortunately, too, Locke has become known in Germany, chiefly through France, and hence we find him, all over the Continent, described both by friends and foes as a sensational 1st; and the charge has been re-echoed in Great Britain by Sir William Hamilton and Dr. Morell. Yet it is quite certain that Locke has an intellectual as well as a sensational side.[83] I have, {296} in a careful perusal of the "Essay," mainly for this very end, discovered in every book, and in the majority even of the chapters, both sides of the shield; but I confess that I have not been able to discover the line that joins them. I do not think that Stewart's remarks on this subject are exhaustive or decisive: he is evidently wrong in supposing that Locke identified reflection with the reason which discovers truth, but his strictures are always candid and sometimes just.

In the "Philosophical Essays," Stewart has many fine observations on taste and beauty. On this subject he was favorably disposed towards the theory of his friend Mr. Alison, and he ascribes more than he should have done to the association of ideas. But he never gave his adhesion to this hypothesis as a full explanation of the phenomena. " If there was nothing," he says, " originally and intrinsically pleasing or beautiful, the associating principle would have no materials on which it could operate." The theory of association was never favorably received by artists, and has been abandoned by all metaphysicians. The tendency now is to return to the deeper views which had been expounded long ago by Plato, and, I may add, by Augustine. I find that Stewart refers to the doctrine of Augustine, who " represents beauty as consisting in that relation of the parts of a whole to each other which constitutes its unity;" and all that he has to say of it is: "The theory certainly is not of great value, but the attempt is curious." The aesthetical writers of our age would be inclined to say of it that there is more truth in it than in all the speculations of Alison, Stewart, Jeffrey, and Brown. It may be safely said that, while earnest inquirers have had pleasant glimpses of beauty, to no one has she revealed her full charms. When such writers as Cousin, Ruskin, and Macvicar dwell so much on unity, harmony, proportion, I am tempted to ask them: Does then the feeling of beauty not arise till we have discovered such qualities as proportion, unity, and harmony? And if they answer in the affirmative, then I venture to show them that

they are themselves holding a sort of association theory; for they affirm that the beautiful object does not excite emotion till, as a sign, it calls forth certain ideas, -- I suspect of truth and goodness. I am not quite sure that we can go the length of this school, when they speak of beauty as a quality necessary, immutable, eternal, like {297} truth and moral good, and connect it so essentially with the very nature of God. There are sounds and colors and proportions felt to be beautiful by us, but which may not be appreciated by other intelligences, and which are so relished by us, simply because of the peculiarities of our human organization and constitution. I acknowledge that, when we follow these colors and sounds and proportions sufficiently far, we come in variably to mathematical ratios and relations; but we are now, be it observed, in the region of immutable truth. Other kinds of beauty, arising from the contemplation of happiness and feeling, land us in the moral good, which is also necessary and eternal. I have sometimes thought that beauty is a gorgeous robe spread over certain portions of the true and the good, to recommend them to our regards and cluster our affections round them. Our aesthetic emotions being thus roused, the association of ideas comes in merely as a secondary agent to prolong and intensify the feeling.

The two volumes on the "Philosophy of the Active and Moral Powers " were published by Stewart immediately before his death. The leading ideas unfolded in them had been given, in an epitomized form, in the "Outlines," published many years before. They are somewhat too bulky for all the matter they contain, and they want somewhat of the freshness of his earlier works; but they are characterized by profound wisdom, by a high moral tone, by a stately eloquence, and the felicitous application of general principles to the elucidation of practical points. He begins with the instinctive principles of action, which he classifies as appetites, desires, and affections. The arrangement is good in some respects, but is by no means exhaustive. As the next step in advance in this department of mental science, an attempt must be made to give a classification of man's motive principles, or of the ends by which man may be swayed in desire and action. Among these will fall to be placed, first of all pleasure and pain; that is, man has a natural disposition to take to pleasure and avoid pain. But this is far from being the sole motive principle in man's mind. There are many others. There is, for example, the tendency of every native faculty to act, and this irrespective of pleasure or pain. Again, there are particular natural appetencies, which look to ends of their own, towards (to use the language {298} of Butler) particular external things of which the mind hath always a particular idea or perception, towards these things themselves, such as knowledge, power, fame, and this independent of the pleasure to be derived from them. Higher than all, and claiming to be higher, is the moral motive, or obligation to do right. A classification of these motive principles, even though only approximately correct, would serve most important purposes in philosophy generally, and more especially in ethics and all the social sciences. Very low and inadequate views have been taken of these motive principles of humanity, especially by those who represent man as capable of being

swayed only by the prospect of securing pleasure or avoiding pain. It should never be forgotten, that the emotive part of man's nature may be excited by a great many other objects as well as pleasure and pain, by all the objects, indeed, which are addressed to the motive principles of man. It is the apprehension of objects as about to gratify the motive principles of the mind -- whatever they be -- which stirs up the emotions. Thus, the apprehension of a coming object, which is to gratify a motive principle, excites hope, which is strong in proportion to the strength of the apprehension, and the strength of the particular motive principle; while the apprehension of a coming object, which is to disappoint this motive principle, stirs up fear. It is strange that Stewart nowhere treats of the emotions in his " Philosophy of the Active Powers."

Stewart's view of the moral power in man, and of moral good, seems to me to be substantially correct. In treating of these subjects, he avows his obligations to Butler and Price. His doctrine has been adopted, with some modifications, which are improvements, by Cousin. Stewart and Cousin are the most elevated of all the moralists who treat of ethics on grounds independent of the Word of God. I am convinced that they never could have given so pure a morality, had they not lived in the midst of light shed abroad on our earth by a super natural religion. I have always felt it to be a strange circumstance, that Stewart and Cousin, in giving so high a view of the moral faculty, are never led to acknowledge that it condemns the possessor; and after presenting moral good in so rigid a form, are not constrained to acknowledge that the moral law has not been kept by man. Taking their own high principles {299} along with them, neither could have looked within, without discovering sin to be quite as much a reality as virtue. Stewart could not have gone out of his dwelling in the old College or the Canongate, nor could Cousin have gone out of his chambers in the Sorbonne, without being obliged to observe how far man and woman have fallen beneath the ideal picture which they have drawn in their lectures. At the very time when the Scottish metaphysicians were discoursing so beautifully of moral virtue, there was a population springing up around their very colleges in Edinburgh and Glasgow, sunk in vice and degradation, which appalled the good men of the next age the age of Chalmers -- to contemplate, which the men of this age know not how to grapple with, and which is not to be arrested by any remedy which the mere philosophic moralists have propounded. I acknowledge most fully, that Stewart's lectures and writings have tended, directly or indirectly, to carry several important measures which are calculated to elevate the condition of mankind, such as reform in the legislature, prison improvement, and the abolition of tests and of restrictions on commerce. But the institutions which aim at lessening the sin and misery of the outcast and degraded such as missions, ragged schools, and reformatories, -- have proceeded from very different influences; and a philosophy embracing the facts which they contemplate, must dive deeper into human nature, and probe its actual condition more faithfully, than the academic moralists of Scotland ever ventured to do.

It is very evident that the Scottish academic metaphysicians of last century, while they pay a dignified respect to Christianity, have not identified themselves with its profound peculiarities. Without meaning to excuse this deficiency, I may yet affirm that some incidental advantages have sprung from this <reticence>. It was certainly better that they should have kept at a respectful distance from Christianity, than that they should have approached it only, like the great German metaphysical systems, to set all its truths in rigid philosophic framework, -- to absorb them all within themselves, as by a devouring flame. But the peculiar advantage arising from their method consists in this, that they have, by induction, established a body of ethical truth on grounds independent of revealed {300} religion; and this can now be appealed to in all defences of Christianity, and as an evidence of the need of something which philosophy is incompetent to supply. Divines can now found on those great truths which the Scottish philosophers have established, as to there being a distinct moral faculty and an immutable moral law, and then press on those whose conscience tells them that they have broken that law, to embrace the provision which revelation has made to meet the wants of humanity.

The space which I have occupied with the " Mental and Moral Philosophy" precludes me from entering on the two volumes of " Political Economy," published partly from manuscripts left by Stewart himself, and partly from notes by pupils. The views expounded will scarcely be regarded as much advancing the science in the present day; but they did good service when delivered for twenty years in lectures. They are still worthy of being looked at on special topics; they may form an interesting chapter in the history of the literature of political economy, and they illustrate the character of Stewart's intellect and philosophy.

An estimate of the influence which has been exercised by Stewart may form an appropriate close to this article.

In Scotland, he increased the reputation of the Edinburgh University. Horner speaks of " many young Englishmen who had come to Edinburgh to finish their education," and not a few of these had been attracted by Stewart. He has had a greater influence than perhaps any other, in diffusing through out Scotland a taste for mental and moral science. I have referred to the power exercised on him by Reid; but, if Stewart owed much to Reid, Reid owed nearly as much to his grateful pupil, who finished and adorned the work of his master, and by his classical taste has recommended the common-sense philosophy to many who would have turned away with disdain from the simpler manner of Reid. And here I am tempted to give utterance to the feeling, that Reid has been peculiarly fortunate in those who have attached themselves to his school. If Stewart helped to introduce Reid to polite society, Sir William Hamilton, by his unmatched logic and vast erudition, has compelled philosophers to give him -- notwithstanding the some what untechnical character of his writings -- a place in their {301} privileged circle. By his expositions of Reid, and his own in dependent labors, Mr. Stewart aided in throwing back a tide of scepticism: -- which had appeared in

France in the previous century; in England toward the beginning of the eighteenth century, on the back of the licentious reigns of Charles II. and James ".; and, in Scotland, about the middle of that century. This tide came to a height about the time of the French Revolution, and it was one of the avowed aims of Stewart, " to stem the inundation of sceptical, or rather atheistical, publications which were imported from the Continent." Nor is it to be forgotten, that Stewart, directly by his lectures and indirectly by his pupils, contributed as much as any man of his age, to diffuse throughout Scotland a taste for elegant literature, and enlarged and liberal opinions in politics.

As to England, Sir J. Mackintosh, writing to Stewart in 1802, speaks of the want of any thing which he could call purely philosophical thinking; and Horner, in 1804, declares, that the highest names in the estimation of those in the metropolis, who felt any interest in speculative pursuits, were Hobbes and Hartley. Such works as the " Moral Philosophy " of Paley, were fitted to lower still farther, rather than elevate, this taste. It was altogether, then, for the benefit of English thought, that Stewart did become gradually known in South Britain, where his elegant style, his crowning good sense, and the moderation of his opinions, recommended him to many who had imbibed as great an aversion to Scotch metaphysics as ever George III. had. There are still Englishmen who abhor the infidelity of Hume, and who despise the plainness of Reid, who suspect the rhetoric of Brown, and are frightened by the bristling nomenclature and logical distinctions of Hamilton, but who are attracted by the writings of Stewart, which are felt to be as pleasing and as regular as their own rich fields bounded by hedge-rows. In England he has so far been of use in creating a philosophical spirit, where none existed before, and in checking the utilitarianism of Paley. lie is also entitled to a share of the credit of the great measures of reform, which such pupils as Horner, Brougham, Lord John Russell, Palmerston, Jeffrey, and Lansdowne carried in Parliament. Perhaps these eminent men have never estimated the amount of wholesome impulse which they received in early life from the prelections and lofty character of the Edinburgh professor. {302}

In France the influence of Reid and Stewart has been considerable, and has been of the most beneficial character. In that country, Locke's philosophy, unfortunately introduced by Voltaire and accepted in its worst side, had wrought only mischief, partly by its drawing away the attention of thinkers from the more spiritual philosophy of Descartes, and partly by its tempting a set of speculators to derive all men's ideas from sensation, and to deny the existence of all ideas which could not be derived from this source, -- such as the idea of moral good, of infinity, and of God. This wretched philosophy -- if philosophy it can be called -- was one of the fatal powers which operated to give an evil issue to the Revolution, and prevented good from coming out of it. After sensationalism-which used, but only to abuse, the name of Locke -- had reigned for more than half a century, there appeared a reaction led on by M. Royer Collard, who began in 1811 to lecture at the Normal School. It is a most interesting circumstance, that, in conducting

this war against the debasing systems which prevailed, he betook himself to the philosophy of Reid and Stewart. Exercising a considerable influence in himself, Royer Collard has had a more extended sway through his pupils, especially Victor Cousin and Theodore Jouffroy. In the course of years, the works of Reid were' translated into French, with an admirable historical and critical introduction, by Jouffroy. So early as 1808, the first volume of Stewart's " Elements " was translated into French by M. Prevost of Geneva; and, at a later date, M. Peisse, has translated the other two volumes of the same work. Stewart's " Outlines " were translated into the same tongue by Jouffroy, who has prefixed a preface of great judgment and acuteness. It thus appears, that the great reaction in favor of sound philosophy, commenced by Royer Collard and conducted by Cousin and Jouffroy, has made large and profitable use of the Scottish school, and rejoices to acknowledge its obligations to Scotland. No doubt, it has also called in aid from other quarters. Cousin has been indebted to the school of Kant, as well as to the school of Reid, and has derived some of his favorite principles immediately from the great metaphysician of his own country, Descartes; and he has besides carefully examined the human mind, in an inductive manner, and he has been able to give a unity to these {303} materials, because he is possessed of great original genius, acuteness, and comprehensiveness of mind. I am sometimes inclined to think, however, that he has got the most precious element in his eclectic system from the school of Scotland. I have been greatly gratified to observe, that, after he had been drawn aside for a time from his attachment to the Scottish philosophy, by a later affection for German transcendentalism (this is very visible in his course of lectures delivered in 1828 and 1829), he returned in his later years to his first love, and this at a time when Scotland was rather forsaking the inductive method, and turning its regards towards the a .priori method of Germany.

I feel proud, I confess, of the eulogiums which have been pronounced on Scotland, not only by Cousin, but by Jouffroy and Remusat. But these philosophers have scarcely seen, after all, wherein lies the peculiar strength of the Scottish nation. This is not to be found in its systems of moral philosophy, but in its religion, of which the high moral tone of its philosophy is but a reflection, which would soon wax dim and vanish were the original light extinguished; -- nay, in remembering that Kant was descended from Scottish parentage, I have sometimes thought that his high moral precepts may be also a reflection from the same light. Often, I should think, when M. Cousin looked around him on these scenes of revolution through which France has passed, must he have seen that his country needs something deeper and more influential than any system of moral science, even though it should be as pure and elevated as that which he inculcated.

In Germany Stewart has been little known, and has exercised no power for good or for evil. The only English philosopher familiarly referred to in that country is Locke, and even he is known, I suspect, more through his French consequences than from the study of his work. The German

professors speak of him, under the name of Locke, as the representative of sensationalism, overlooking the constant reference which he makes to reflection as a separate source of ideas, and to the lengthened account which he gives of intuition, -- a much juster account, in some respects, of its function than that given by Kant or Schelling. The great English ethical writer, Butler, who has established for ever the great truth of the supremacy {304} of conscience in the human constitution, is either altogether unknown in Germany, or referred to by such writers as Tholuck only to show that he is not understood or appreciated. The only Scottish metaphysician thoroughly known in Germany is David Hume. Reid is occasionally spoken of, only to be disparaged in his system and its results. Stewart is scarcely ever named. I must be allowed to regret this. Such a body of carefully inducted fundamental truth as we have in the philosophy of Reid and Stewart is precisely what was and is needed to preserve thought from the extravagances of the transcendental schools in the last age, and now, in the natural recoil which has taken place, since 1848, from the tide of materialism which is setting in so strongly, and with no means or method of meeting it. The philosophy of Germany must ever go by oscillations, by actions and reactions, till the critical method of Kant is abandoned, and the inductive method is used to determine the rule and law of those <a priori> principles of which so much use is made, while there has been so little careful inquiry into their precise nature and mode of operation.

This may be the proper place for referring to the relation in which Stewart stood toward Kant. I have already expressed my regret that Stewart should have entered on a criticism of Kant without a deeper acquaintance with his system. No doubt it might be retorted, that the criticisms of Stewart upon Kant are not more ignorant and foolish than those of the disciples of Kant upon Reid; but it is better to admit that Stewart committed a blunder in his review of the Kantian system. Some have supposed that, if he had known more of Kant, he would have formed a totally different opinion of his philosophy. And I admit that a further acquaintance with Kant's works would have raised Kant in his estimation; would have kept him from describing his nomenclature as "jargon," and his philosophy as " incomprehensible," from affirming that Kant has " thrown no new light on the laws of the intellectual world;" would have shown him many curious points of correspondence between the views of Kant and the profoundest of his own doctrines, and have enabled him, when he did depart from Kant, to give fair and valid reasons, and thus to help in what must be one of the tasks of philosophy in this age, -- the work of taking from Kant what is good and true, and casting away {305} what is evil, because false. While I admit all this, I am convinced at the same time that Stewart would never have given an adhesion to the peculiarities of Kantism. He would have said, " My method of induction is better than your method of criticism, and my account of the intuitive convictions of the mind is correct when I represent them as fundamental laws of thought and belief; whereas you are giving a wrong account of them when you represent them as <a priori> forms imposing on the objects in all cognition something which is not in the objects." I cannot conceive

him, in any circumstances, allowing to Kant (as Hamilton unfortunately did) that space and time and causation are laws of thought and not of thought and may have merely a subjective existence. His caution, his good sense, and his careful observation, would have prevented him from ever falling into a system of nescience such as that to which the relentless logic of Hamilton has carried him, founding, I acknowledge, on premises which Stewart as well as Kant had furnished. He would have adhered, after knowing all, to his decision: "We are irresistibly led to ascribe to the thing itself (space) an existence independent of the will of any being." It is an " in comprehensible doctrine which denies the objective reality of time." " That space is neither a <substance>, nor an <accident>, nor a <relation>, may be safely granted; but it does not follow from this that it is nothing objective." " Our first idea of space or extension seems to be formed by abstracting this attribute from the other qualities of matter. The idea of space, however, in whatever manner formed, is manifestly accompanied with an irresistible conviction that space is necessarily existent, and that its annihilation is impossible," etc. He adds, " To call this proposition in question, is to open a door to universal scepticism." ("Diss.," pp. 596, 597.)

The great work which the school of Reid has done consists in its careful investigation, in the inductive manner first, of the faculties of the mind; and, secondly, and more particularly, of man's primary and intuitive convictions. For this they ought to be honored in all time. Kant did a work similar to this last, but in a different manner. Rejecting (as Reid had done) the combined dogmatic and deductive method of Descartes, he introduced the critical method, affirming that reason can criticise itself, and proceeding to criticise reason by a kind of {306} logical process of a most unsatisfactory kind. Criticism has succeeded criticism, each new critic taking a new standing-point, or advancing a step farther, till Hegel's system became the <reductio ad absurdum> of the whole method of procedure inaugurated by Kant. I admit that Kant was right in affirming that <a priori> principles should be examined before they are assumed in philosophical investigation. We are not at liberty to assume a first truth till we have shown it to be a first truth; and we have no right to use it in argument or deduction till we have determined its precise nature and law; but this is to be done, I maintain, in the inductive manner, with its accompanying analysis and exclusions. The Scottish school commenced this work, but they do not profess to have completed it. Stewart everywhere proclaims that it is to be done by the combined efforts of successive inquirers, pursuing the same method for ages.

Reid and Stewart nowhere profess to give a full list, or even a rigid classification, of the intuitive convictions of the mind. All that they affirm is, that those principles which they have seized for the purpose of meeting the scepticism of Hume, are and must be intuitive. They do not even pretend to give a full account of these, or to express them in their ultimate form. They vacillate in the account which they give of them, and in the nomenclature which they employ to denote them. They draw no definite distinction between cognitions, beliefs, and judgments. They treat of

the faculties, and also of the principles of common sense, but they do not tell us how the two stand related to each other. And here I may be permitted to observe, that I look on these fundamental laws as being the necessary laws of the faculties regulating all their exercises, but not as laws or principles before the consciousness; and they are to be reflexly discovered as general laws only by the induction of their individual acts. Reid and Stewart do not even tell us what are the tests by which their presence may be detected: these I hold to be, first, as Aristotle and Locke have shown, self-evidence; and, second, as Leibnitz and Kant have shown, necessity and universality. Such defects as these they were quite willing to confess in that spirit of modesty which was one of their highest characteristics; and to any one complaining that they had not settled every point, they would, {307} as it were, say, Go on in the path which we have opened; we are sure that there is more truth yet to be discovered, and rejoice we must and will if you succeed where we have failed and raise a little higher that fabric of which we have laid the foundation.

XLI -- WILLIAM LAWRENCE BROWN.

I/N\ 1785, Mr. Burnett, a merchant in Aberdeen, bequeathed certain sums to be expended at intervals of forty years in the shape of two premiums for the best works furnishing "evidence that there is a Being, all powerful, wise, and good, by whom every thing exists: and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this, in the first place, from considerations independent of written revelation, and. in the second place, from the revelation of the Lord Jesus, and from the whole to point out inferences most necessary for and useful to mankind." This endowment has not called forth any one great work; but, on each of the two occasions on which it has been competed for, it has been the means of publishing two excellent treatises. On the first competition, the first prize was awarded to Principal Brown of Aberdeen, and the second to the Rev. John Bird Sumner, afterwards Archbishop of Canterbury.

Dr. Brown was born at Utrecht, 1755, and became minister of the Scotch church there. He removed to Scotland in 1795, became professor of divinity in Aberdeen, and afterwards principal of Mariscbal College. He lived till 1830. When in Holland he wrote an " Essay on the Folly of Scepticism." His Burnett Prize Essay, "On the Existence of a Supreme Creator," was given to the world in 1816. The work did not produce much impression in its own age, and is now all but forgotten. People wonder that so large a sum (upwards of l 1,200) did not call forth a more brilliant production; but the truth is, that money cannot produce an original work, which can come only from the spontaneous thoughts of the man of genius, that prize essays are commonly respectably good and nothing more. and, while they may serve a good purpose in their own day, are seldom valued as a legacy by posterity. The book is in many respects the perfection of a prize essay. It conforms rigidly to the conditions imposed by the donor; it is supremely judicious; it did not startle the judges by any eccentricity or even

novelty, and certainly not by any profundity; and altogether is a clear and able defence of natural and revealed religion. It interests us to notice that the principles of the Scottish philosophy are here employed to support the great truths relating to the being of God and the destiny of man. {308}

XLII. -- ARCHIBALD ALISON

H/E\ was born in Edinburgh in 1757, studied at Glasgow University, went thence to Oxford, where he matriculated in Baliol College. Taking orders in the Church of England in 1784, he received several preferments; such as, a prebendal stall in Salisbury, and the perpetual curacy of Kenley in Shropshire. He married a daughter of John Gregory, and thus became more closely identified with Edinburgh, where he continued usually to reside, and where he discharged the duties of an Episcopal clergyman in the Cowgate chapel from the year 1 down to the time of his death in 1839. He was distinguished for his excessive politeness. He published a volume of sermons, which had the good fortune (or the bad, for the " Edinburgh had never a great reputation as a critic of sermons) to get a laudatory notice in the Edinburgh Review, where they were compared to the "Oraisons Funebres" of Bossuet, and it was said of them: "We do not know any sermons so pleasing or so likely to be popular, and do good to those who are pleased with them. All the feelings are generous and gentle, all the sentiments liberal, and all the general views just and ennobling" But the work which lives is "Essays on the Nature and Principles of Taste," which was published in 1790, but seems to have passed very much out of sight till the booksellers in 1810 told him that there was a wish expressed for the second edition, which was reviewed by Francis Jeffrey in 1811, and afterwards had an extensive circulation in various countries.

The arrangement and manner of the work are admirable. The style is distinguished by infinite grace, and is worthy of being compared to that of Addison: -- indeed I am not sure if we have a more beautiful specimen of the last-century manner of composition, moulded on the " Spectator," on the French classics, and the wits of Queen Anne. Every word is appropriate, and is in its appropriate place; and the sentences glide along like a silvery stream. The descriptions of natural scenery, which are very numerous, are singularly felicitous and gracefully: that word <graceful> ever comes up when we would describe his manner. He does not seem to have had an equal opportunity {309} of studying beauty in the fine arts, in architecture, statuary, and painting, though the allusions to the universally known models of these are always appreciative and discriminating.

Drawing a distinction, very essential in all such inquiries, he would investigate, first, the nature of those qualities that produce the emotions of taste, and then that faculty by which the emotions are received. This distinction, clearly announced, is not thoroughly carried out. In the body of the work, in inquiring into the faculty raising the emotions, he makes the remark, that they are not " the objects of immediate observation," and that they are often obscured under the number of qualities with which they

are accidentally combined. He does not seem to have expounded his views as to the faculty. He opposes the theories which have uniformly taken for granted the simplicity of the emotion, and especially those which have made it a sense or senses. He endeavors to show that it has no resemblance to a sense, and that it is finally to be resolved into the more general principles of our constitution. He shows that "it is not, in fact, a simple but a complex emotion: that it involves in all cases, first, the production of some simple emotion or the exercise of some moral affection; and, secondly, the consequent excitement of a peculiar exercise of the imagination; that these concomitant effects are distinguishable and very often distinguished in our experience; and that the peculiar pleasure of the beautiful or sublime is only felt when these two effects are conjoined, and the complex emotions produced." In entering on his " Analysis," he proceeds on the philosophic principle, that we should consider the effects before we proceed to determine the cause. So he is to begin with considering the effect produced on the mind when the emotions of beauty or sublimity are felt, and then go on to investigate the causes which are productive of it, or, in other words, the sources of the beautiful and sublime in nature.

(1) "When any object either of sublimity or beauty is presented to the mind, I believe man is conscious of a train of thought being immediately awakened in his imagination analogous to the character or expression of the original object. The simple perception of the object, we frequently find, is insufficient to excite these emotions, unless it is accompanied with this operation of mind; unless, according to common expression, {310} our imagination is seized and our fancy busied in the pursuit of all those trains of thought which are allied to this character or expression. Thus, when we feel either the beauty or sublimity of natural scenery, the gay lustre of a morning in spring, or the mild radiance of a summer evening, the savage majesty of a wintry storm, or the wild magnificence of a tempestuous ocean, -- we are conscious of a variety of images in our minds very different from those which the objects themselves can. present to the eye. Trains of pleasing or of solemn thought arise spontaneously within our minds: our hearts swell with emotions of which the objects before us afford no adequate cause." The state of mind most favorable to the emotions of taste is one in which the imagination is free and unembarrassed; and the feeling is not interfered with by any thing which interrupts the flow, is not interfered with in particular by the intrusion of criticism. He shows that the exercise of imagination and the feeling of beauty is increased by association, especially that of resemblance, and enters upon the field which had been so cultivated by Beattie. He remarks very truly how an acquaintance with poetry in our earlier years has a powerful influence in increasing our sensibility to the beauties of nature.

He then gives an analysis of the peculiar exercise of the imagination. There is, in all cases, the indulgence of a train of thought. But then, every train of thought does not raise emotions of beauty; and so he investigates the nature of those trains of thought that are produced by object, of

sublimity and beauty, and their difference from those ordinary trains which are unaccompanied with such pleasure. This difference consists in two things: first, in the nature of the ideas or conceptions which compose such trains; and, secondly, in the nature of the law of their succession. Some ideas are fitted to raise emotions: these he calls " ideas of emotions; " and the train of thought which produces beauty is in all cases composed of ideas capable of exciting some affection or emotion." Thus, the ideas suggested by the scenery of spring are ideas productive of emotions of cheerfulness, of gladness, and of tenderness. The images suggested by the prospect of ruins are images belonging to pity, to melancholy, to admiration. The ideas in the same manner awakened by the view of the ocean in a storm are ideas of power, of majesty, and of terror. But farther the {311} ideas themselves must have some general principle of connection, subsisting through the whole extent of the train, giving them a certain and definite character, and a conformity to that peculiar emotion which first excited them. It appears, that " in every operation of taste, there are thus two different faculties employed; viz., some affection or emotion raised, and the imagination excited to a train of thought corresponding to this emotion. The peculiar pleasure which attends and which constitutes the emotions of taste, may naturally be considered as composed of the pleasures which separately attend the exercise of those faculties, or, in other words, as produced by the union of pleasing emotion with the pleasure which by the constitution of our nature is annexed to the exercise of the imagination." Our consciousness testifies that there is truth and very important truth in all this. Every form of beauty in nature and art, music for instance, raises a train of ideas which are accompanied with emotions all of a certain kind. While he has brought before us a body of facts, it may be doubted whether he has seen himself, or exposed to the view of others, the whole of the mental phenomena. The question arises, What starts the train? and a farther question follows, What gives the unity and harmony to the train? An answer to these questions, or rather to this question, -- for the questions are one, -- may disclose to our view an objective beauty and sublimity very much overlooked by Alison, and the supporters of the association theory.

(2) It is proper to state that Alison does speak in the second and longest essay of the beauty and sublimity of the material world. He treats of the beauty of sound, color, form, motion, and of the human countenance and form. He says matter in itself is unfitted to produce any kind of emotion, and can raise an emotion of beauty only by an association with other qualities, and "as being either the signs or expressions of such qualities as are fitted by the constitution of our nature to produce emotion." To those who consider sounds simply as sounds they have no beauty. There is surely an oversight here: for music has in itself a beauty which can be mathematically expressed; but then the feeling of beauty is prolonged and intensified by the train of emotional ideas which is set a going. Alison traces the associations raised by sounds. The sublimity of thunder is founded on awe and some degree of {312} terror. Sounds arc no longer sublime when they do not awaken such feelings.

"There is nothing more common than for people who are afraid of thunder to mistake some very common and indifferent sound for it; as, the rumbling of a cart, or the rattling of a carriage. While their mistake continues, they feel the sound as sublime: the moment they are undeceived, they are the first to laugh at their terror and to ridicule the sound which occasioned it. Children, at first, are as much alarmed at the thunder of the stage as at real thunder. Whenever they find that it is only a deception, they amuse themselves by mimicking it." He represents the real power of music as consisting in its imitation of those signs of emotion or passion which take place in the human voice.

In respect of colors, he holds that they are not beautiful, except as " expressive to us of pleasing or interesting qualities." He is successful in showing that there is a beauty of color arising from association of color, as in dress for instance: but science announces that there is a harmony of colors, as of complementary colors, that is, of colors making up the white beam, which is beautiful physiologically. He maintains that "the beauty of forms arises altogether from the associations we connect with them," or the qualities of which they are expressive to us. Sublimity of forms arises from their suggesting ideas of danger or power, or from their magnitude. Among natural objects, angular forms are associated with hardness, strength, or durability, suggesting force; and winding forms, with freewill, fineness, delicacy, ease. He labors to prove that proportion, as in architecture, is felt to be beautiful, because expressive of fitness. Aesthetic science maintains in opposition that there are certain proportions in length and composition which to our eye have a beauty in themselves. As to motion, it is felt to be beautiful, because associated with power. Rapid motion in a straight line is simply expressive of great power. Slow motion in curves is expressive of gentle power, united with ease, freedom, and playfulness.

He dwells at length on the different sources of the beauty or sublimity of the countenance of man. It arises, first, from physical beauty, or the beauty of certain colors and forms considered simply as forms or colors; secondly, from the beauty of expression and character, or that habitual form of features and {313} color of complexion which, from experience, we consider as significant of those habitual dispositions of the human mind which we love or approve or admire; thirdly, from the beauty of emotion, or the expression of certain local or temporary affections of mind which we approve or love or admire. Each of these species of beauty will be perfect when the composition of the countenance is such as to preserve, pure and unmingled, the expression which it predominantly conveys -- and when no feature or color is admitted but which is subservient to the unity of this expression. The last or highest degree of beauty or sublimity of the human countenance will alone be attained when <all> these expressions are united when the physical beauty corresponds to the characteristic when the beauty of temporary emotion harmonizes with the beauty of character; and when all fall upon the heart of the spectator as one whole, in which matter, in all its most exquisite forms, is only felt as the sign of one great or amiable

character of mind."

In criticising this theory, I am prepared to admit that the ingenious author has seized and unfolded to our view a large body of truth which had never been so fully developed before. He is surely right in saying that there is a train of ideas in all those operations of mind in which we contemplate what is called beautiful and sublime: it is so, as we listen to music, grave or gay; as we gaze at a waterfall, or into the starry vault of heaven. It is also certain that all these ideas are emotional: that is, accompanied with emotion; and that the ideas and emotions are all of a connected kind, and thus produce the one effect. On these points his views seem to me to be just, and they are to a great extent original. It should farther be allowed that in all this there is the influence of association of ideas, regulated by such principles as contiguity and resemblance: this had been shown fully before his time by Hutcheson, by Beattie, and others of the Scottish school. But is this all? It seems as if we needed, besides, both a start to the movement and a principle of connection to make it proceed in one direction. In music there are sounds which produce a pleasant sensation: these are regulated, as has been known since the time of Pythagoras, by mathematical relations. This pleasant sensation gives the impulse to the train of emotional thought, it sustains it, and gives to it a congruity. Again, it has been shown that there {314} are melodious and harmonious colors, which are pleasing to the eye; and these set out the mind on a pleasant train of association, and keep it on the one tract. Attempts have been made, since the days of Plato, to discover forms which are essentially beautiful; and these have so far been successful. There are proportions and there are curves which are adapted to the laws of light on the one hand, and to our sensory organs on the other. Are not these the roots from which our associated ideas and emotions spring? Are not the objects possessing them entitled to be called beautiful and sublime?

While there is a beauty of sound, color, and form to act as the root of the feeling, it is to be allowed to Alison that there is a train of ideas and feelings which constitutes, is it were, the growing trunk. But, as Alison has shown, it is not every train of idea, nor even every train of emotional idea, that is fitted to raise emotions which are beautiful or sublime. There is need of a bond of connection to raise the proper kind of ideas, and to make them flow in one direction, so as to produce a uniform result. The objective sound, color, form, proportion, expression, must not only start the association, but must so far guide it along a consistent line; make the ideas and feelings, for instance, which are raised as we stand gazing on a lovely countenance or a lofty waterfall, all to be of a sort and to contribute to one emotional result.

There are two grand oversights in the explanations of Alison: he overlooks the moving power which starts the train, and the guiding rails which direct it. This leaves a very great gap in his theory: he has no objective ground for beauty; and this has set against it both artists and scientific investigators, who are apt to turn away from it

with unbelief or with scorn, saying that they are not to be taken in by this illusory picture, for they are sure that beauty is a reality in the thing itself. It is the business of science, by its own methods, to investigate the precise objective nature of sounds, colors, and forms; and there is ground for believing that the laws involved will at last be enunciated in mathematical expressions.

But there is a higher element than all this in beauty; an element seen by Plato and by those who have so far caught his spirit,-- such as, Augustine, Cousin, MacVicar, and Ruskin, but commonly overlooked by men of science and the upholders {315} of the association theory. The mere sensations or perceptions called forth by the presence of harmonious sounds, colors, and proportional forms, is not the main ingredient in the lovely and the grand. Beauty, after all, lies essentially in the ideas evoked. I hold by an association theory on this subject. But the ideas entitled to be called aesthetic should be of mind, and the higher forms of mind, intellectual and moral. There was, therefore, grand truth in the speculation of Plato, that beauty consists in the bounding of the waste, in the formation of order out of chaos; or, in other words, in harmony and proportion. There was truth in the theory of Augustine, that beauty consists ill order and design; and in that of Hutcheson, that it consists in unity with variety. Alison had, at times, a glimpse of this truth, but then lost sight of it. He speaks with favor of the doctrine held by Reid, that matter is not beautiful in itself, but derives its beauty from the expression of mind; he holds it true, so far as the qualities of matter are immediate signs of the powers or capacities of mind, and in so far as they are signs of those affections or dispositions of mind which we love, or with which we are formed to sympathize. He thus sums up his views: " The conclusion, therefore, in which I wish to rest is, that the beauty and sublimity which is felt in the various appearances of matter are finally to be ascribed to their expression of mind; or to their being, either directly or indirectly, the signs of those qualities of mind, which are fitted, by the constitution of our nature, to affect us with pleasing or interesting emotion." There is a singular mixture of truth and error in this statement: truth, in tracing all beauty and sublimity to the expression of mind; but error, in placing it in qualities which raise emotion according to our constitution. Beauty, and sublimity are not the same as the true and the good; but they are the expression and the signs of the true and the good, suggested by the objects that evidently participate in them. {316}

XLIII.-GEORGE FARDINE.

A/LL\ throughout the seventeenth century, there was a strong reaction in Great Britain against Aristotle, scholasticism, and formal logic generally. College youths everywhere were protesting against the syllogism, moods and figures, and reduction. Unfortunately, logic -- in Glasgow, Edinburgh, and Saint Andrews, -- came in the second year of the college course; and youths of fifteen or sixteen groaned under the yoke, and longed for some thing more fascinating and less arduous. The professor who did most to gratify this

taste was Jardine, professor of logic and rhetoric in the university of Glasgow.

For several sessions after his appointment, he followed the established method, giving the usual course of logic and metaphysics, though he says, " every day more and more convinced me that something was wrong in the system of instruction; that the subjects on which I lectured were not adapted to the age, the capacity, and the previous attainments of my pupils." "To require the regular attendance of very young men two hours every day during a session of six or seven months, on lectures which they could not understand, and in which, of course, they could take no interest, had a direct tendency to produce habits of negligence, indifference, and inattention, which, it is well known, frequently terminate in a positive aversion to study of every description. The change from the animated perusal of the Greek and Roman classics to the unfathomable depths of logic and metaphysics was far too abrupt." The fault evidently lay, not in having logic as a required branch of study, and not in requiring it to be thoroughly learned, but in bringing it in too early in the course, and in not having in the second year a course on English literature and composition. Jardine did give a course of formal logic, but it was very much pressed into a corner. His text-book, "Quaedam ex Logicae Compendiis Selecta," is a meagre abridgment carrying the student among the bones of the study, without clothing them with life, and fitted to leave the impression that the branch is as useless as it is dry. He enlarged with much deeper interest on the human mind generally, and the various faculties: on language, on taste, on beauty, on criticism, -- showing no originality or grasp of intellect, but furnishing a course of great utility to young students, and felt to be interesting and stimulating.

His views were expounded in his " Outlines of Philosophical Education, illustrated by the Method of Teaching the Logic Class in the University of Glasgow." The work is still worthy of being looked into by all who would study what the Germans call " Pedagogic." He points out the advantages of the lecturing system. " While listening to a discourse delivered with some degree of animation, the mind of the student is necessarily more awakened, and feels a more powerful demand made upon its energies, than when perusing a printed volume." "In a class-room, a sympathetic feeling pervades the whole; the glow of zeal and an expression of curiosity {317} are perceived in almost every countenance; all the faculties of the mind are exerted; and powers unused before are awakened into life and activity." But he insists that the lecturing be accompanied with regular examinations. The teacher " will not examine the class in any stated order, but occasionally call upon the same individual at two successive hours, or even twice in one hour; and, as a check upon open negligence, lie may sometimes select such as appear the least attentive, and thereby expose their idleness to their fellow-students." But the most important part of his work is that in which he explains his views as to themes for composition, recommending that some be presented as fitted to enable the student to form clear and accurate notions and to express his thoughts, others to give a power of analysis and

classification, a third to exercise and strengthen the reasoning faculties, and a fourth to encourage processes of investigation. Under this fourth head, he suggests as a theme, "There was fine linen in Egypt in the time of Moses," and would have the student thence determine the state of Egypt as to government, science, and art.

Professor Jardine was born at Wandal, in the upper ward of Lanarkshire, in 1742. He was educated at Glasgow College, and became a licentiate of the Church of Scotland. In 1771, be became tutor to two sons of Baron Mure, and travelled with them in France. On his return in 1773, he was an unsuccessful candidate for the chair of humanity in Glasgow; but, in 1774, he was appointed assistant and successor to Mr. Clow, professor or logic and rhetoric. In 1824, -- he retired from the teaching of logic, and died in 1827. His pupils acknowledged their deep obligations to him in interesting them in study and imparting to them a power of writing the English language. But certainly he did not advance the science of logic, or help to promote the study of it among young men. Francis Jeffrey, who was fond of expressing his gratitude to him, may be taken as the representative pupil produced by him, capable of thinking and expressing himself clearly and ably on every subject, but not diving into the depths of any subject. It required all the ability and energy of Sir William Hamilton to bring back Scottish youths to the scientific study of logic.

XLIV.-THOMAS BROWN.[84]

I/N\ regard to the younger years of Thomas Brown, it is enough
to mention, that he was born at Kirkmabreck, in the stewartry of Kirkcudbright, in January, 1778; that his father, who was minister of that place, died soon after, when the family removed to Edinburgh; that he there received the rudiments {318} of his education from his mother, that, in his seventh year, he went to London, under the protection of a maternal uncle, and attended successively schools at Camberwell, Chiswick, and Kensington, down to the time of the death of his uncle, in 1792, when he returned to Edinburgh, to reside with his mother and sisters, and begin his collegiate course in the university. He is described as a precocious child, and we can believe it. He was precocious all his life, and in every thing. We have to regret that he did not take sufficient pains to secure that the flower which blossomed so beautifully should be followed by corresponding fruit. We can credit his biographer, when he tells us that he learned the alphabet at a single lesson; but I suspect that there must have been the prompting of some theological friend preceding the reply which he gave, when he was only between four and five, to an inquiring lady, that he was seeking out the differences in the narratives of the evangelists. At school he was distinguished by the gentleness of his nature and the delicacy of his feelings; by the quickness of his parts, and particularly by the readiness of his memory; by his skill in recitation, and his love of miscellaneous reading, especially of works of imagination. Nor is it to be forgotten that he also gave promise of his genius for

poetry, by verses which one of his masters got published, perhaps unfortunately for the youth, in a magazine. He read with a pencil in his hand, with which he made marks; and, in the end, he had no pleasure in reading a book which was not his own. He began his collegiate course in Edinburgh by the study of logic under Finlayson; and having, in the summer of I 793, paid a visit to Liverpool, Currie, the biographer of Burns, introduced him to the first volume of Stewart's " Elements." The following winter he attended Stewart's course of lectures, and had the courage to wait on the professor, so renowned for his academic dignity, and read to him observations on one of his theories. Mr. Stewart listened patiently, and then read to the youth a letter which he had received from M. Prevost of Geneva, containing the very same objections. This was followed by an invitation to the house of the professor, who, how ever, declined on this, as he did on all other occasions, to enter into controversy. It is but justice to Stewart to say, that he continued to take a paternal interest in the progress of his {319} pupil, till the revolt of Brown against the whole school of Reid cooled their friendship, and loosened the bonds which connected them. In 1796 he is studying law, which, however, he soon abandoned for medicine, and attended the medical classes from 1798 till 1803. At college, he received instructions from such eminent professors as Stewart, Robison, Playfair, and Black, and was stimulated by intercourse with college friends, such as Erskine, Brougham, Reddie, Leyden, Horner, Jeffrey, and Sidney Smith, -- all precocious and ambitious like himself, and who, in the "Academy of Sciences," debated on topics far beyond their years and their knowledge.

It was when Brown was at college, that Erasmus Darwin's "Zoonomia" was published. The work is filled with premature theories as to life and mind, and proceeds on the method, as Brown calls it, of " hypothetical reasoning," -- a method, I may remark, carried still further, but with a more carefully observed body of facts to support it, by his illustrious grandson, Charles Darwin. Brown read it at the age of eighteen, was irritated by its materialistic tendency, and scribbles notes upon it; these ripen into a volume by the time he is nineteen, and were published by the time he was twenty, -- " Observations on the Zoonomia of Erasmus Darwin, M. D." Brown was an excellent physiologist for his day; but both the original work and the reply proceed on principles now regarded as antiquated. But Brown's criticism is a remarkable example of intellectual precocity. In the midst of physiological discussions, most of the metaphysical ideas which he developed in future years are to be found here in the bud. He considers the phenomena of the mind as mental states, speaks of them as "feelings," delights to trace them in their succession, and so dwells much on suggestion, and approaches towards the theory of general notions, and the theory of causation, expounded in his subsequent works. It should be added, that the book committed him prematurely to principles which he was indisposed to review in his riper years. It appears from a letter to Darwin, that, at the age of nineteen, he had a theory of mind which he is systematizing.

Out of the " Academy of Sciences " arose, as is well known, the " Edinburgh Review," in the second number of

which there was a review, by Brown, of Viller's "Philosophie de {320} Kant." The article is characterized by acuteness, especially when it points out the inconsistency of Kant in admitting that matter has a reality, and yet denying this of space and time, in behoof of the existence of which we have the very same kind of evidence. But the whole review is a blunder, quite as much as the reviews of Byron and Wordsworth in the same periodical. He has no appreciation of the profundity of Kant's philosophy, and no anticipation of the effects which it was to produce, not only on German but on British thinking. Immersed as he was in medical studies, fond of French literature, and tending towards a French sensationalism, he did not relish a system which aimed at showing how much there is in the mind independent of outward impression. The effects likely to be produced on one who had never read Kant, and who took his views of him from that article, are expressed by Dr. Currie " I shall trouble myself no more with <transcendentalism>; I consider it a philosophical hallucination." It is a curious instance of retribution, that, in the succeeding age, Brown's philosophy declined before systems which have borrowed their main principles from the philosophy of Kant, and deal as largely with <a priori> " forms," " categories," and " ideas," as Brown did with " sensations," " suggestions," and " feelings."

We feel less interest than he did himself in two volumes of poetry, which he published shortly after taking his medical degree in 1803. His next publication was a more important one. The chair of mathematics in Edinburgh was vacant, and Leslie was a candidate. The city ministers attached to the court party wished to reserve it for themselves, and urged that Leslie was incapacitated, inasmuch as he had expressed approbation of Hume's doctrine of causation. It was on this occasion that Brown wrote his " Inquiry into the Relation of Cause and Effect," -- at first a comparatively small treatise, but swolen, in the third edition (of 1818), into a very ponderous one It is divided into four parts, -- the first, on the import of the relation; the second, on the sources of the illusion with respect to it; the third, on the circumstances in which the belief arises; and the fourth, a review of Hume's theory. The work is full of repetitions, and the style, though always clear, is often cumbrous, and wants that vivacity and eloquence which so distinguish his posthumous lectures. It is characterized {321} by great ingenuity and power of analysis. He has dispelled for ever a large amount of confusion which had collected around the relation; and, in particular, he has shown that there is no link coming <between> the cause and its effect. "The <substances> that exist in a train of phenomena are still, and must always be, the whole constituents of the train." If the cause be A and the effect B, there is not a third thing x necessary in order to A being followed by B. He agrees with Hume, in representing the relation as consisting merely in invariable antecedence and consequence. In this he has been guilty of a glaring oversight. It may be all true, that there is nothing coming <between> the cause and its effect, and yet there may be, what he has inexcusably overlooked, a power or property in the substances acting as the cause to produce the effect. He calls in substances, we have seen. " The cause must

always be a substance existing in a certain state, and the effect, too, a substance existing in a certain state; " -- he does not see that in material action there are substances two or more in the cause, and substances two or more in the effect. But he fails to enquire what is involved in substances, and the qualities of substance, and does not discover that power is involved in substance and properties. It is but justice to Brown to add, that, in one very important particular, he differs from Hume; that is, in regard to the mental principle which leads us to believe in the relation. This, according to Hume, is mere custom; whereas, according to Brown, it is an irresistible intuitive belief. By this doctrine, he attached himself to the school of Reid, and saved his system from a sceptical tendency, with which it cannot be justly charged. This irresistible be lief, he shows, constrains us to believe that the universe, as an effect, must have had a cause. It is to be regretted that he did not inquire a little more carefully into the nature of this intuitive belief which he is obliged to call in, when he would have found that it constrains us to believe not only in the invariability of the relation but in the potency of the substances operating as causes to produce their effects.

We are not concerned to follow him in his medical career, in which he became the associate of the famous Dr. Gregory in 1806. We are approaching a more momentous epoch in his life. Dugald Stewart being in a declining state of health, {322} Brown lectured for him during a part of sessions 1808-9 and 1809-10; and, in the summer of 1810, Stewart having expressed a desire to this effect, Brown was chosen his colleague, and, from that time, discharged the whole duties of the office of Professor of Moral Philosophy.

Even those who have never seen him can form a pretty lively image of him at this time, when his talents have reached all the maturity of which they are capable, and his reputation is at its height. In person, he is about the middle size; his features are regular, and in the expression of his countenance, and especially of his eye, there is a combination of sweetness and calm reflection. His manner and address are somewhat too fastidious, not to say finical and feminine, for a philosopher; but the youths who wait on his lectures are disposed to, over look this, when they fall under the influence of his gentleness, so fitted to win, and of the authority which he has to command. Expectation was on the tiptoe, and he fully met and gratified it. His amiable look, his fine elocution, his acuteness and ingenuity, his skill in reducing a complex subject into a few elements, his show of originality and independence, the seeming comprehensiveness of his system, and, above all, his fertility of illustration, and the glow, like that of stained glass, in which he set forth his refined speculations, did more than delight his youthful audience, -- it entranced them; and, in their ecstasies, they declared that he was superior to all the philosophers who had gone before him, and, in particular, that he had completely superseded Reid, and they gave him great credit, in that he generously refrained from attacking and overwhelming Stewart. He had every quality fitted to make him a favorite with students. His eloquence would have been felt to be too

elaborate by a younger audience, and regarded as too artificial and sentimental by an older audience, but exactly suited the tastes of youths between sixteen and twenty. A course so eminently popular among students had not, I rather think, been delivered in any previous age in the University of Edinburgh, and has not, in a later age, been surpassed in the fervor excited by Chalmers or Wilson. In the last age you would have met, in Edinburgh and all over Scotland, with ministers and lawyers who fell into raptures when they spoke of his lectures, and assured the younger generation that in comparison with him Wilson {323} was no philosopher, and Hamilton a stiff pedant. It should be added, that, when the students attending him were asked what they had got, not a few could answer only by exclamations of admiration, "How fine!" "How beautiful!" "How ingenious!" In those large classes in the Scottish colleges which are taught exclusively by written lectures, large numbers, including the dull, the idly inclined, and the pleasure-loving, are apt to pass through without receiving much benefit, -- unless, indeed, the professor be a very systematic examiner and laborious exacter of written exercises; and this, I rather think, Brown was not. As he left the impression on his students, that there was little wisdom in the past, and that his own system was perfect, he did not create a spirit of philosophic reading such as Hamilton evoked in select minds in a later age. But all felt the -- low of his spirit, had a fine literary taste awakened by his poetical bursts, had their acuteness sharpened by his fine analysis, went away with a high idea of the spirituality of the soul, and retained through life a lively recollection of his sketches of the operations of the human mind. This, I venture to affirm, is a more wholesome result than what was substituted for psychology in the succeeding age, -- <a priori> discussions derived from Germany or demonstrated idealisms spun out by an exercise of human ingenuity.

His biographer tells us that, on his appointment to the chair, he had retired into the country in order that fresh air and exercise might strengthen him for his labors, and that, when the session opened, he had only the few lectures of the previous winters; but such was the fervor of his genius and the readiness of his pen, that he generally commenced the composition of a lecture after tea and had it ready for delivery next day by noon, and that nearly the whole of the lectures contained in the first three of the four-volumed edition were written the first year of his professorship, and the whole of the remaining next session. Nor does he appear to have rewritten any portion of them, or to have been disposed to review his judgments, or make up what was defective in his philosophic reading. He seems to have wasted his life in sending forth volume after volume of poetry, which is, doubtless, beautifully and artistically composed, after the model of the English poets of the eighteenth century, but its pictures are without individuality, and {324} they fail to call forth hearty feeling. Far more genuine poetical power comes out incidentally in some of the bursts in his philosophic lectures than in whole volumes of his elaborate versification.

The incidents of his remaining life are few, but are

sufficient to bring out the lineaments of his character. His chief enjoyments lay in his study, in taking a quiet walk in some solitary place, where he would watch the smoke curling from a cottage chimney, or the dew illuminated with sunshine on the grass, and in the society of his family and a few friends. Never had a mother a more devoted son, or sisters a more affectionate brother. In his disposition there is great gentleness, with a tendency to sentimentality: -- thus, on the occasion of his last visit to his native place, he is thrown into a flood of sensibility, which, when it is related in future years to Chalmers, on his happening to be in the place, the sturdier Scotch divine was thrown into a fit of merriment. We perceive that he is fond of fame and sensitive of blame, but seeking to cherish both as a secret flame; and that he is by no means inclined to allow any one to offer him counsel. In 1819, he prepared his " Physiology of the Mind," as a text-book for his students, and put it into the press the following winter. By the Christmas of that year he was rather unwell; in spring he removed for the benefit of his health to London, and died at Brompton in April, 1820. His remains were deposited in the churchyard of his native place, beside those of his father and mother.

His lectures were published shortly after his death, and excited an interest wherever the English language is spoken, quite equal to that awakened by the living lecturer among the students of Edinburgh. They continued for twenty years to have a popularity in the British dominions and in the United States greater than any philosophical work ever enjoyed before. During these years most students were introduced to metaphysics by the perusal of them, and attractive beyond measure did they find them to be. The writer of this article would give much to have revived within him the enthusiasm which he felt when he first read them. They had never, however, a great reputation on the Continent, where the sensational school thought he had not gone sufficiently far in analysis; where those fighting with the sensational school did not feel that he {325} was capable of yielding them any aid; and where the transcendental school, in particular, blamed him for not rendering a sufficiently deep account of some of the profoundest ideas which the mind of man can entertain, such as those of space, time, and infinity. His reputation was at its greatest height from 1830 to 1835, from which date it began to decline, partly because it was seen that his analyses were too ingenious, and his omissions many and great; and partly because new schools were engaging the philosophic mind; and, in particular, the school of Coleridge, the school of Cousin, and the school of Hamilton. Coleridge was superseding him by views derived from Germany, which he had long been inculcating, regarding the distinction between the understanding and the reason Cousin, by a brilliant eclectic system, which professedly drew largely from Reid and Kant; and Hamilton, by a searching review of Brown's theory of perception, and by his own metaphysical views promulgated in his lectures and his published writings. The result of all this was a recoil of feeling in which Brown was as much undervalued as he had at one time been overrated. In the midst of these laudations and condemnations, Brown's psychological system has never been completely reviewed. Now that he has passed through a

period of undeserved popularity, and a period of unmerited disparagement, the public should be prepared to listen with candor to an impartial criticism.

The psychology of Brown may be summarily described as a combination of the Scottish philosophy of Reid and Stewart, and of the analyses by Condillac, Destutt de Tracy, and the higher philosophers of the sensational school of France, together with views of the association of ideas derived from a prevailing British school. To Reid and Stewart he was indebted more than he was willing to allow, and it would have been better for his ultimate reputation had he imbibed more of their spirit, and adhered more closely to their principles. He admits everywhere with them the existence of principles of irresistible belief; for example, he comes to such a principle when he is discussing the beliefs in our personal identity, and in the invariability of the relation between cause and effect. But acknowledging, as he does, the existence of intuitive principles, he makes no inquiry into their nature and laws {326} and force, or the relation in which they stand to the faculties. In this respect, so far from being an advance on Reid and Stewart, he is rather a retrogression. His method is as much that of Condillac, Destutt de Tracy, and the ideologists of France, as that of Reid and Stewart. He is infected with the besetting sin of metaphysicians, -- that of trusting to analyses instead of patient observation; and, like the French school, his analysis is exercised in reducing the phenomena of the mind to as few powers as possible, and this he succeeds in doing by omitting some of the most characteristic peculiarities of the phenomena. His classification of the faculties bears a general resemblance to that of M. de Tracy, the metaphysician of the sensational school. The Frenchman's division of the faculties is -- sensibility, memory, judgment, and desire Brown's is-sensation, simple and relative suggestion, and emotion.

In estimating the influences exercised from without on Brown, we must further take into account, that ever since the days of Hartley there had been a great propensity in Britain to magnify the power and importance of the association of ideas. Not only habit but most of our conceptions and beliefs had been referred to it: Beattie and Alison, followed by Jeffrey, ascribed to it our ideas of beauty; and, in a later age, Sir James Mackintosh carried this tendency the greatest length, and helped to bring about a reaction, by tracing our very idea of virtue to this source. It is evident that Brown felt this influence largely. Our intelligence is resolved by him into simple and relative suggestion. There is a flagrant and inexcusable oversight here. All that association, or, as he designates it, suggestion, can explain, is the order of the succession of our mental states; it can render no account of the character of the states themselves. It might show, for example, in what circumstances a notion of any kind arises, say our notion of time, or space, or extension, but cannot explain the nature of the notion itself.

But it will be necessary to enter a little more minutely into the system of Brown. From the affection which I bear to his memory, and remembering that his views have

never been used by himself or others to undermine any of the great principles of morality, I would begin with his excellences. {327}

(1) In specifying these, I am inclined to mention, first, his lofty views of man's spiritual being. He everywhere draws the distinction between mind and body very decidedly. In this respect, he is a true follower of the school of Descartes and Reid, and is vastly superior to some who, while blaming Locke and Brown for holding views tending to sensationalism, or even materialism, do yet assure us that the essential distinction between mind and matter is now broken down.

(2) I have already referred to the circumstance, that Brown stands up resolutely for intuitive principles, and in this respect is a genuine disciple of the Scottish school. He calls them by the very name which some prefer as most expressive, -- " beliefs; " and employs the test which Leibnitz and Kant have been so lauded as introducing into philosophy. He everywhere characterizes them as "irresistible,"-a phrase pointing to the same quality as "necessary,"-the term used by the German metaphysicians. No one, not even Cousin, has demonstrated, in a more effective manner, that our belief in cause and effect is not derived from experience. " When we say, then, that B will follow A to-morrow, because A was followed by B to-day, we do not prove that the future will resemble the past, but we take for granted that the future is to resemble the past. We have only to ask ourselves why we believe in this similarity of sequence; and our very inability of stating any ground of inference may convince us that the belief, which it is impossible for us not to feel (observe the appeal to necessity, but it is an appeal to a necessity of feeling), is the result of some other principle of reasoning." (" Cause and Effect," P. 111.) " In ascribing the belief of efficiency to such a principle, we place it, then, on a foundation as strong as that on which we suppose our belief of an external world, and even of our own identity, to rest. What daring atheist is he, who has ever truly disbelieved the existence of himself and others? For it is he alone who can say, with corresponding argument, that he is an atheist, because there is no relation of cause and effect." " The just analysis, then, which reduces our expectation of similarity in the future trains of events to intuition, we may safely admit, without any fear of losing a single argument for the existence of God." By this doctrine he has separated himself for ever from sensationalists, and given great trouble to those classifiers {328} of philosophic systems who insist, contrary to the whole history of British philosophy, that all systems must either be sensational or ideal. It is quite obvious that such men as Butler, Brown, and Chalmers, cannot be included in either of the artificial compartments, and hence one ground of their neglect by the system-builders of our age.

(3) His account of sensation is characterized by fine analysis: in particular, his discrimination of the sensations commonly ascribed to touch, and his separation of the muscular sense from the sense of touch proper. About this very time Charles Bell was establishing the distinction

of the nerves of sensation and motion. " I was finally enabled," says Sir Charles, to show that the muscles had two classes of nerves; that on exciting one of these the muscles contracted, that on exciting the other no action took place. The nerve which had no power to make the muscle contract was found to be a nerve of sensation." Contemporaneously, Brown was arguing, on psychological grounds, that by the muscular sense we get knowledge which cannot be had from mere feeling or touch. "The feeling of resistance is, I conceive, to be ascribed not to our organ of touch but to our muscular frame." Hamilton, by his vast erudition, has been able (note appended to Reid's works) to detect anticipations of these views; but they were not so clearly stated, and they were not conclusively demonstrated. Brown started, and carried a certain length, those inquiries regarding the variety of sensations commonly ascribed to touch, which have ever since had a place in psycho logical treatises.

(4) Nor must we omit his ingenious and felicitous mode of illustrating the succession of our mental states, called by him "suggestion," to intimate that there is no connection in the nature of things between the ideas, and not " association," which might leave the impression that there was a nexus joining them. He is particularly successful in showing how by association the various ideas and, he adds, feelings blend, and, as it were, coalesce. He has called attention to an important phenomenon, which has been little noticed ever since he brought it out to view, and which he himself did not see the significance of. " In our mental sequences, the one feeling which precedes and induces another feeling does not necessarily on that account give place to it; but may continue in {329} that virtual sense of combination, as applied to the phenomena of the mind, of which I have often spoken, to coexist with the new feeling which it excites, outlasting it, perhaps, and many other feeling to which, during its permanence, it may have given rise. I pointed out to you how important this circumstance in our mental constitution is to us in various ways: to our intellectual acquirements, since without it there would be no continued meditation, but only a hurrying confusion of image after image, in wilder irregularity than in the wildest of our dreams; and to our virtue and happiness, since, by allowing the coexistence and condensation of various feelings in one complex emotion, it furnishes the chief source of those moral affections which it is at once our happiness to feel and our virtue to obey." He has here got a glimpse of a great truth, which needs to be developed more fully than it has yet been it is the power of a motive principle, and of a strong purpose and resolution abiding in the mind to sway the train of thoughts and feelings. Had he followed out his own hint, it would have led him to discover deep springs of action directing the flow of suggestions.

While he illustrates the laws of suggestion under the three Aristotelian heads of contiguity, resemblance, and contrast, he intimates his belief that they may all be reduced to a finer kind of contiguity. As the latest speculations have not yet got down to the depths of this subject, it may be useful to know the hints thrown out by Brown, who seems to me to be so far on the right track, but not to have reached the highest fountain from which the

stream issues: --

"All suggestion, as I conceive, may, if our analysis be sufficiently minute, be found to depend on prior existence, or at least on such immediate proximity as is itself very probably a modification of coexistence." He begins with resemblance: "if a portrait be faithfully painted, the effect which it produces on the eye that perceives it is the same, or very nearly the same, as the effect produced on the eye by similar light reflected from the living object; and we might therefore almost as justly say, that when any individual is seen by us repeatedly he suggests himself by resemblance, as that he is thus suggested by his portrait." This surely comes very close to Hamilton's principle, that resembling objects, so far as they are alike, are the same, and to his law of repetition or identity. The following brings us quite as near his law of redintegration In many other cases, in which the resemblance is less complete, its operation may, even without such refinement of analysis as that to which I have alluded, be very obviously brought under the influence of contiguity. Thus, as the drapery forms {330} so important a part of the complex perception of the human figure, the costume of any period may recall to us some distinguished person of that time. A ruff like that worn by Queen Elizabeth brings before us the sovereign herself, though the person who wears the ruff may have no other circumstance of resemblance: because the ruff and the general appearance of Queen Elizabeth, having formed one complex whole in our mind, it is necessary only that one part of the complexity should be recalled -- as the ruff in the case supposed -- to bring back all the other parts by the mere principle of contiguity. The instance of drapery, which is but an adjunct or accidental circumstance of the person, may be easily extended to other instances, in which the resemblance is in parts of the real and permanent figure." " In this manner, by analyzing every complex whole, and tracing, in the variety of its composition, that particular part in which the actual similarity consists, -- and which may therefore be supposed to introduce the other parts that have formerly coexisted with it, -- we might be able to reduce every case of suggestion from direct resemblance -- to the influence of mere contiguity." " By the application of a similar refined analysis to other tribes of associations, even to those of contrast, we may perhaps find that it would be possible to reduce these also to the same comprehensive influence of mere proximity as the single principle on which all suggestion is founded." I am far from holding that this analysis into parts of the concrete idea starting the suggestion, furnishes a complete solution of the difficulties connected with fixing on one ultimate law; but it seems to set us on the right track.

He gives us a somewhat crude, but still important, classification of what he calls the secondary laws of suggestion, which induce one associate conception rather than another. He mentions longer or shorter continuance;

more or less liveliness; more or less frequently present; more or less purity from the mixture of other feelings; differences of original constitution; differences of temporary emotion; changes in the state of the body; and general tendencies produced by prior habits. Had this arrangement been presented by another he would have proceeded to reduce it to simpler elements.

(5) His distribution of the relations which the mind can discover is worthy of being looked at: they are --

I. COEXISTENCE.

(1) Position.
(2) Resemblance or Difference.
(3) Degree.
(4) Proportion.
(5) Comprehension (whole and parts).

II. SUCCESSION.

(6) Casual Priority.
(7) Causal Priority.

{331} This classification is worthy of being placed along side that of Locke and Hume. It may be compared with Kant's " Categories of the Understanding; " but it should be observed that the German metaphysician makes his categories forms imposed by the mind on things, whereas the Scotch psychologist simply gives to the mind the power of discerning the relations in things. The arrangement of Brown is superior to that of Hamilton, to be afterwards discussed, and vastly more comprehensive and just than that of those later physiological psychologists who reduce the relations which the mind can perceive to the single one of resemblance and difference, thus restricting the powers of intelligence within far narrower limits than have been assigned by nature, and all to make it somewhat easier to account for the whole on materialistic principles.

(6) His biographer declares his account of the general notion to be a great advance on all that had been proposed by previous philosophers. Brown states the process to be the following: "We perceive two or more objects, -- this is one state of the mind. We are struck with the <feeling> of their resemblance in certain respects, -- this is a second state of the mind. We then, in the third stage, give a name to these circumstances of felt resemblance, a name which is, of course, applied afterwards only where this relation of similarity is felt. " He has here seized some of the characteristic steps in the process of forming the general notion. He is right in giving a prominent place to the discovery of resemblance, but he should have called it a perception of resemblance, and not a feeling of resemblance, -- language which seems to ascribe the whole to the emotive rather than the cognitive part of our nature. And he has missed, after all, the essential, the consummating step,-the placing of the objects under a head or in a class which embraces all the objects possessing the resembling qualities, to which class thus formed the name is given. He has a searching review of nominalism, which be charges with

overlooking the resemblance. He asks, " Why do I class together certain objects, and exclude certain others from the class which I have formed? " He shows that the infant must reason before it has acquired language, " He has already calculated distances long before he knew the use of a single word expressive of distance. "

(7) He has some fine remarks on beauty. He separates from {332} Alison, who resolves it into the general feelings of our nature, and argues resolutely that there is an original and unresolvable class of feelings excited by the beautiful. He remarks that in the emotion of beauty, "by a sort of reflex transfer to the object which excited it, we identify or combine our agreeable feeling with the very conception of the object, whether present or absent." He is able to come to the conclusion: " It is mind alone that is the living fountain of beauty, because it is the mind which, by reflection from itself, embodies in the object or spreads over it its own delight. " He overlooks, however, the objective beauty arising from the harmony of sounds and colors, and from proportion and harmony.

(8) Some place higher than any of his other excellencies his eloquent exposition of the emotions,-- an exposition which called forth the laudations both of Stewart and Chalmers, the latter of whom wrote a preface to that part of his lectures which treats of the feelings. He is particularly successful in showing that man is not by his nature and constitution a selfish being, but is possessed of social and benevolent affections. His lectures on the emotions are radiant all over with poetry, and will repay a careful reading much better than many of the scholastic discussions or anatomical descriptions which are furnished in some of the chairs of mental science.

(9) It would be injustice not to add that he has some very splendid illustrations of natural theism, fitted at once to refine and elevate the soul. I have never heard of any youth being inclined towards scepticism or pantheism, or becoming prejudiced against Christian truth, in consequence of attending or reading the lectures of Brown. In note E, appended to his work on " Cause and Effect, " he has a powerful argument in favor of the possibility of a miracle, showing that it is not inconsistent with the intuitive law of cause and effect. " There is no violation of a law of nature, but there is a new consequent of a new antecedent."

Over against these excellencies I have to place certain grave deficiencies and errors.

(1) I take exception to the account which he gives of the very object and end of mental science. According to him, it is to analyze the complex into the simple, and discover the laws of the succession of our mental states. There is a great {333} and obvious oversight here. The grand business of the science of the human mind is to observe the nature of our mental states, with the view of co-ordinating them and rising to the discovery of the laws which they obey and the faculties from which they proceed. Taking this view, analysis becomes a subordinate though of course an important instrument; and we have to seek to discover the faculties

which determine the nature of the states as well as the laws of their succession.

(2) In his analysis he often misses the main element of the concrete or complex phenomena. In referring ideas to sensation he neglects to consider how much is involved in body occupying space, and how much in body exercising property; and the account of memory he fails to discover how much is implied in recognizing the event remembered as having happened in time past,-that is, he omits the idea of time. Often, too, when he has accomplished an analysis of a complex state, does he forget the elements, and reminds us of the boy who imagines that be has annihilated a piece of paper when he has burnt it, forgetting that the elements are to be found in the smoke and in the ashes. It is by a most deceitful decomposition -- it is by missing the very <differentia> of the phenomena -- that he is able to derive all our intellectual ideas from sensation and simple and relative suggestion.

(3) He grants that there are intuitive principles of belief in the mind; but he has never so much as attempted an induction of them, or an exposition of their nature and of the laws which regulate them, or a classification of them. In this respect he must be regarded as falling behind his predecessors in the school, and behind Hamilton, who succeeded him in the estimation of students of mental science. The intelligent reader is greatly disappointed to find him, after he has shown so forcibly that there is an intuition involved in our belief in personal identity and in causation, immediately dropping these intuitions and inquiring no more into their nature. He takes great credit for reducing the faculties and principles enumerated by Reid to a much smaller number; but if we gather up all the elements which he is obliged to bring in, we shall find the list to be as large as that of Reid or Stewart. {334}

(4) Thus he represents consciousness as merely a general term for all the states and affections of mind; and then, in order to account for our belief in the sameness of self, he is obliged to call in a special instinct. " We believe our identity, as one mind, in our feelings of to-day and our feelings of yesterday, as indubitably as we believe that the fire which burned yesterday would in the same circumstances burn us to-day, not from reasoning, but from a principle of instinct and irresistible belief, such as gives to reasoning itself all its validity." It is this irresistible belief, involved in the very nature of consciousness, this belief in self and the identity of self, which makes consciousness -- I mean self-consciousness (and not a vague consciousness) -- a separate faculty. This faculty is a source to us of a separate set of cognitions and ideas, the knowledge of self and of the states of self, -- such as thinking, feeling, resolving.

(5) According to Brown, in perception through the senses we look immediately on a sensation in the mind, and not on any thing out of the mind. Hamilton has severely criticised this doctrine. Hamilton had a discriminately searching classification of the forms. which ideal sense-perception bad assumed, and he makes Brown's theory one of

the forms of idealism. But the truth is, Brown's doctrine can scarcely be called idealism. It might be appropriately called inferentialism. It is the same substantially as that of Destutt de Tracy and the French ideologists, who, maintaining the existence of body, argued that infants reach a knowledge of it by a process of inference. The argument is unfolded by Brown at great length and with much ingenuity. The mind can never perceive any thing directly but the sensation, but then this sensation as a -- phenomenon must have a cause. He argues this on the principle, perceived to be intuitively certain, that every effect has a cause. The sensation then must have a cause; but then it has not, like some other of our mental states and affections, -- such as our sentiments and perceptions of duty, -- a cause within the mind itself; it must therefore have a cause without the mind, and this cause is matter. It is clear as to this inference, that it will be acknowledged frankly only by those who look on causation as an intuitive conviction. If belief in causation be merely experimental, it is doubtful whether {335} we should ever discover the law to be universal, for by far the greater number of our sensations would be phenomena of which we could discover no cause. We might group the phenomena in some way, but we should not be able to say logically whether they have a cause or not. But leaving this, as perhaps only a doubtful point, we can affirm confidently that even if, by such a process, we could infer that these sensations have a cause, it must be an unknown cause, a cause of which we have no experience. But matter seems to be something known. We certainly have an idea of extension, or rather of something extended -- I would add, a belief in an extended substance. Our belief is not in an unknown cause, but in a known existence,-- known as existing and extended. But we never could reach the belief, we never could reach even the idea of space which we certainly have, by any logical process proceeding on the existence of a sensation. From a sensation, which is unextended, we cannot rise to the idea of an extended thing. Logically and consequentially, Brown's theory of the cognition of matter prepared the way for that of J. S. Mill, who makes our idea of body to be of a mere possibility of sensations.

(6) He overlooks some of the distinguishing attributes of the reproductive powers of the mind. Conception, memory, and imagination are merely exercises of simple suggestion. He does not give the phantasy or imaging power a separate place. "Memory is not a distinct intellectual faculty, but is merely conception or suggestion combined with the feeling of a particular relation, -- the relation to which we give the name of priority." Observe what confusion of things we have here: memory is a " suggestion, " but implies a " relation, " which is represented as a ,feeling;" and "priority," implying the idea of time past, present, and future, comes in so quietly that we are not expected to notice it, though it is one of the most profound of our ideas. In imagination, he overlooks that high intellectual power which binds the scattered images in a unity, often of a very grand character. A simplification gained by overlooking these characteristic qualities is altogether illusive.

(7) In his account of the faculties of relative suggestion, he mixes up two things which ought to be carefully distinguished, -- the suggestion, which is a mere law of the succession {336} of our ideas, and comparison, by which we discover the relations of things. He cannot make these one by calling them by the one name of relative suggestion.

(8) He has discovered an important element in the process of reasoning. He sees that in reasoning there is the explication of what is involved in the conceptions; but he does not notice the laws of comprehension and extension involved in drawing one conception from another or others.

(9) He has a fine exposition of the emotions, dividing them according to the principle of time, -- as immediate, retrospective, and prospective; but be overlooks two essential elements. One is, the idea or phantasm as the basis of the emotion. We cannot have a feeling towards a mother unless we have an idea of her. He is guilty of a greater oversight: he has taken no notice of those springs of action or motive principles, dwelt on by Stewart,-such as the love of self, of our neighbors of society, of power, -- which call forth and guide the emotions in certain channels.

(10) He does not distinguish between our emotions on the one hand and the wishes and volitions on the other, -- a distinction always drawn in one form or other by our highest moralists, and strongly insisted on by Kant and his school in Germany. Surely there is a difference in kind between such an emotion as that of hope or fear on the, one hand and a purpose or determination to act on the other. With Brown, will is merely the prevailing desire, and desire an emotion.

(11) His view of the moral faculty is very defective. It is represented by him as a mere class of emotions. He calls them " emotions of approbation and disapprobation." The very epithets employed by him, "approbation" and " disapprobation, " might have shown that judgment is involved. Conscience is not only an emotive, it is a cognitive power, revealing to us what ought and ought not to be done. Dr. Chalmers shows that be has overlooked the great truth brought out by Butler, that conscience is a power in the mind, not simply co-ordinate with the others, but authoritative and supreme, claiming subjection from all the voluntary powers. Nor ought it to be omitted that be does not bring out fully that the moral faculty declares man to be a sinner. He thus constructed an ethical system, and delivered it in Edinburgh, -- which sometimes {337} claims to be the metropolis of evangelical theology, without a reference to redemption or grace. No teachers ever inculcated a purer moral system than Reid, Stewart, or Brown; but they do not seem willing to look at the fact that man falls infinitely beneath the purity of the moral law. They give us lofty views of the moral power in man, but forget to tell that this power condemns him. Taking up the demonstrations of the Scottish metaphysicians in regard to the conscience, an inquiry should be made,-How are they affected by the circumstance that man is a sinner? This was the grand topic started by Chalmers, and by which he effected a reconciliation between the philosophy and the

theology of Scotland.

(12) He has not been able to give an adequate account of some of the profoundest ideas which the mind of man entertains; such as, that of personal identity, of power in substances, of infinity and moral good. The tendency of his philosophy was counteracted in the next age by Coleridge, Cousin, and Hamilton, drawing largely from German sources.

XLV.-FRANCIS JEFFREY.[85]

FRANCIS JEFFREY was not specially a metaphysician, but he studied metaphysics and wrote upon them, and so deserves a passing notice. He was the son of a depute clerk of the Court of Session, and was born on a " flat " in Charles Street, Edinburgh, October 23, 1773. At the age of eight, he entered (in an intensely excited state) the high school, at that time presided over by Dr. Adam, a scholar and a man of character; and at fourteen be entered Glasgow College with some idea of getting an Oxford exhibition, and there he was under Jardine, the professor of logic and rhetoric, of whom he says:" It is to him and his most judicious instruction I owe my taste for letters, and any literary distinction I may since have been enabled to attain." A fellow-student, afterwards Principal Macfarlan of Glasgow, reports of him that in the first year " he exhibited nothing remarkable, {338} except a decree of quickness, bordering, as some thought, on petulance; " and another fellow-student, afterwards Principal Haldane of St. Andrews, describes him as a little black creature whom he had not observed, but was noticed by him as haranguing some boys on the college green against voting for Adam Smith as lord rector, and who was opposed by young Jeffrey because he was the candidate of the professors. In the second year he broke upon them very brilliantly as one of the most acute and fluent speakers, his favorite subjects being criticism and metaphysics. While at college be was most diligent in writing, in a terribly illegible hand, whole volumes of notes of his professors' lectures, mixed with remarks of his own, and innumerable essays, most of them of a critical character. Francis Jeffrey was absolutely destined to be a critic. Any one might have seen this in these restless eyes, ever scintillating, and might have argued it from his quick and clear apprehension, from his searching spirit and his sound judgment on all subjects not requiring wide comprehension or original genius. On leaving Glasgow, he went home to the "dear, retired, adored little window " of his Lawnmarket garret, and again scribbled papers, sixty of which remained in the time of his biographer. Jeffrey was the genuine product of the lecture-hearing, essay-writing, debating-society privileges of the Scottish colleges. In 1791 he went up to Oxford, the instruction in which, as requiring quiet study and no writing, he did not enjoy so much as that of Glasgow, and he describes his fellow-students as "pedants, coxcombs, and strangers." He eagerly sought when in England to get rid of his Scotch pronunciation, and succeeded in acquiring a clipped and affected English. At the end of the academic year, he went back to Scotland, where he got into the heart of a body of clever and ambitious youths. His peculiar talents were specially called forth by the "

Speculative Society," which had been instituted in 1764, and which reached its highest reputation at the time he attended it; and there he had to wrestle with such men as Francis Horner, Henry Brougham, Lord Lansdowne, and David Boyle, afterwards president of the Court of Session; and Henry Cockburn tells us how enraptured he was with speeches by him on national character, by Horner on the immortality of the soul, and Brougham on the power of Russia. I doubt much whether any of them threw {339} much light on these subjects; but they discussed them ably, and to the great delight of the aspiring youths of Edinburgh. His business consisted in attending law lectures, and his amusement in writing thousands of lines of poetry, the moon being the special object of his admiration among, natural beauties. His ambition then was, " I should like, therefore, to be the rival of Smith and Hume." He joined conscientiously and eagerly the Whig party, which included such men as James Gibson (afterwards Sir James Gibson Craig), the Rev. Sir Henry Wellwood Moncreiff, John Allen, John Thomson in the medical profession, and Dugald Stewart and John Playfair in the college and in doing so he knowingly cut himself off from all hope of receiving government patronage.

We now come to the most important event in his life, the establishment of the " Edinburgh Review," the first number of which appeared in October, 1802. The account is given by Sydney Smith: " One day we happened to meet on the eighth or ninth story or flat [it was actually the third, but the whole party wished to make their descriptions lively and telling] in Buccleuch Place, the elevated residence of the then Mr. Jeffrey. I proposed we should set up a Review: this was acceded to with acclamation. I was appointed editor (not formally), and remained long enough in Edinburgh to edit the first number." The most influential writers were Jeffrey, Smith,[86] Brougham, and Horner; but the ruling spirit and the guiding hand was Jeffrey, who now found the sphere for which he was fitted by native taste and capacity, and for which he had been prepared by his whole training in reading miscellaneously and writing systematically, and in his legal learning. Horner describes him at this period, " when the genius of that little man was almost unknown to all but his roost intimate acquaintances. His manner is not at first pleasing; but, what is worse, it is of that cast which almost irresistibly impresses upon strangers the idea of levity and superficial talents. Yet there is not any man whose real character is so much the reverse. He has, indeed, a very sportive {340} and playful fancy; but it is accompanied with an extensive and varied information, and a readiness of apprehension almost intuitive, with judicious and calm discernment, with a profound and penetrating understanding."

The starting of the " Edinburgh Review," with its blue and yellow cover, undoubtedly constituted an era in the history of literature. There had been magazines and even reviews, such as the earlier " Edinburgh Review," but none of the same comprehensive, independent, and fearless character. Hitherto literary periodicals had been very much the organs of booksellers; but these bold youths undertook to make the publisher their mere agent, and required him to pay decently for the articles. In the first number seven

articles were written by Smith, four by Horner, four commonly ascribed to Brougham, and five by Jeffrey. None of the writers were learned, in the proper sense of the term none of them were engaged in profound investigations: but they were all well informed men, and possessed of brilliant talents, if not of genius. They wrote quickly, easily, clearly, pungently, with quite as much information as their readers wished. The early writers did little fitted to advance science, or the higher forms of literary genius; but they cut down pretension of every kind Unmercifully, and they were ever in favor of good taste and good sense. They have left nothing permanent themselves; but they produced a mighty influence on their own age and through it on the succeeding age. They failed to discover the rising genius of Byron; they did not appreciate Wordsworth; they did not encourage the study of Goethe,[87] and of the great German writers; they ridiculed {341} missionary effort when it appeared in the churches, and proclaimed that heathen nations must be civilized before they can be Christianized, -- as if to teach men that they have a soul were not the most potent means of awakening thought and thereby starting civilization. But the " Review" promoted a healthy tone of writing and a liberal spirit in politics, and helped more than any other literary organ to effect a reform in the legislature. From this Lime forth, Francis Jeffrey became the terror of all authors about to publish, and of all bigoted Tory politicians. While thus an object of dread to strangers, be seems to have been loved by all who knew him. He was editor of the " Review" for twenty-seven years, and wrote two hundred and sixty-one articles. He published a selection from these in 1843.

Though obnoxious to the government of the day, and without political or family patronage, and not a favorite with some of the old writers to the signet who had the means of sending cases to him or keeping them back, he rose steadily at the bar, and in the course of years stood in the first rank. He was well read in law, was particularly fitted to discuss questions of right and equity, was clear and philosophical in his arrangement, ingenious in his arguments, fluent in utterance, tasteful in language, ready at reply, poignant in repartee, and sharp in his strokes of with judges came to appreciate his legal ability, juries liked his point and life, and church courts enjoyed his ingenious defences of bad causes, which he was often called to defend.

We are now arrived at the second great literary epoch of the capital of Scotland. In the first, that of the last half of the previous century, had appeared a number of grave and thinking men, each striking out a path for himself. This second consisted of a brilliant circle of writers, critics, and talkers. They formed a club of which Scott, Jeffrey, Stewart, Playfair, Sydney Smith, Brougham, the " Man of Feeling," Cockburn, {342} Horner, Alison, and Thomas Brown were members. In this circle, the two most eminent men were Walter Scott, the poet and reputed novelist, and Francis Jeffrey, the critic. " Edinburgh was at that time, to a far greater extent than it is now the resort of the families of the gentry, who used to leave their country residences and enjoy the gayety and the fashion which their presence tended

to promote. Many of the curious characters and habits of the preceding age -- the last purely Scotch age that Scotland was destined to see-still lingered among us." After this time the ambitious youths of Scotland trooped to London, and left Edinburgh as specially a lawyers' city, relieved by a healthy mixture of university professors, of eminent doctors, and high-class teachers. When Jeffrey's professional income became large, he had as his residence Craigcrook, three miles north west of Edinburgh, on the eastern slope of the Corstorphine Hill, and he lived there thirty-four seasons. Thither a select but miscellaneous band of visitors resorted on the Saturday afternoons " The Craigcrook party began to assemble about three, each taking to his own enjoyment. The bowling-green was sure to have its matches in which the host joined with skill and keenness; the garden had its loiterers; the wall, not forgetting the wall of yellow roses, their worshippers; the hill its prospect seekers. The banquet that followed was generous; the-wines never spared, but rather too various; mirth unrestrained except by propriety; the talk always good, but never ambitious, and those listening in no disrepute."

As he had promoted the cause of parliamentary reform so steadily and consistently, there was an appropriateness in his being sent to the House of Commons, where he spoke in behalf of the Reform Bill, and, after the Reform Bill passed, in his being the representative of the city of Edinburgh. One of the great speeches in behalf of the bill was by him, and he carried through the Scotch Reform Bill and the Borough Reform measure. Still his career in Parliament was not eminently successful. I remember that, when he was first sent to St. Stephen's, the question was eagerly discussed in Edinburgh, whether their great literary critic was likely to prove a parliamentary states man and orator, when Chalmers decided, " he wants momentum." He retired from the House of Commons in 1834, and became a judge, his decisions being always wise and weighty. In particular {343} he defended the ancient rights and the independence of the church of Scotland in a very able paper, showing that he had a very clear apprehension of the distinction between the spiritual and temporal powers. When between four and five hundred ministers threw up their livings rather than submit to have the spiritual privileges of the church and the liberties of the people trampled on, he exclaimed: " I am proud of my country." He died January, 1850, giving so far as is known no religious sign either in life or in death.

In his " Contributions to the Edinburgh Review," he has a number of articles on metaphysical subjects. He has a long review, afterwards republished in the " Encyclopaedia Britannica," of Alison on Taste. He argues against the notion of beauty being a simple sensation, or the object of a separate and peculiar faculty, and urges the difference of tastes as a proof of this: an analogous argument might show that there was no faculty to discern truth or moral good. He also opposes the idea of beauty being a real property of objects. He then expounds his own theory. " In our opinion, then, our sense of beauty depends entirely on our previous experience of simpler pleasures or emotions, and consists in the <suggestion> of agreeable or interesting sensations with

which we had formerly been made familiar by the direct and intelligible agency of our common sensibilities; and that vast variety of objects to which we give the name of beautiful become entitled to that appellation, merely because they all possess the power of recalling or reflecting those sensations of which they have been the accompaniments, or with which they have been associated in our imagination by any other more casual bond of connection." This theory differs slightly from that of Alison; but is not an improvement of it, and is liable to the same objections. In one point, he seems to have the advantage of the author he reviews. Jeffrey holds the perception of beauty " to be, in most cases, quite instantaneous, and altogether as immediate as the perception of the external qualities of the object to which it is ascribed." I believe that Alison is right when he says that there is a flow of imagination; but then there must be something to start it, and this something -- be it a color, a form, a sound, a harmony -- raises a feeling at once, and is entitled to be called beautiful. He maintains that objects are sublime or beautiful when, along with other qualities, {344} they act as " natural signs and perpetual concomitants of pleasurable sensations, or, at any rate, of some lively feeling or emotion in ourselves, or in some other sentient beings." I am inclined to think that beautiful objects act as signs, but they do so by suggesting ideas of the true and the good.

He has a review of Priestley, and in it examines materialism. He shows that " the qualities of matter are perceived, but perception cannot be perceived." " If the eye and the ear, with their delicate structures and fine sensibility, are but vehicles and apparatus, why should the attenuated and unknown tissues of the cerebral nerves be supposed to be any thing else?" "Their proposition is, not that motion produces sensation, which might be as well in the mind as in the body, -- but that sensation is motion, and that all the phenomena of thought and perception are intelligently accounted for by saying that they are certain little shakings in the pulpy part of the brain." There may be little shakings in the brain for any thing we know, and there may even be shakings of a different kind accompanying every act of thought or perception; but that the shakings themselves <are> the thought or perception we are so far from admitting that we find it absolutely impossible to comprehend what is meant by the assertion."

He has a review of Stewart's " Life of Reid " and of Stewart's Philosophical Essays." He writes in the most laudatory terms of both, and of the Scotch philosophy generally. But he ventures to criticise them, and blames Reid for multiplying without necessity the number of original principles and affections: he sees no reason for admitting a principle of credulity or a principle of veracity in human nature, or for interpreting natural signs. He commends his exemplary diligence and success in subverting the ideal system, but adds: " We must confess that we have not been able to perceive how the destruction of the ideal can be held as a demonstration of the real existence of matter," -- as if Reid had ever claimed that it did so, or as if he had not expressly rested our belief on

body on the principle of common sense. He labors to show that mental science cannot bring with it any solid issues, and represents " the lofty estimate which Mr. Stewart has made of the <practical> of his favorite study as one of those splendid visions by which men of genius have been so often misled in the enthusiastic pursuit of {345} science and virtue." No doubt psychology cannot directly add to our animal comforts, as chemistry can, but surely when we know approximately and <provisionary> (which is all we know in chemistry) the laws of the senses, of memory, of association, imagination, judgment, reasoning, feeling, and conscience, we may get <practical> benefits of another kind in being better able to regulate our own minds and influence the minds of others. On one point he seems rather to have the advantage of Stewart. In his review of Stewart's " Life and Writings of Reid," he maintains that it is principally by <experiment>, and not by mere observation, that those splendid improvements have been made which have erected so vast a trophy to the prospective genius of Bacon." Stewart replied, in his " Philosophical Essays " and " Dissertation," showing that experiment is a species of observation and that mind can be and has been experimented on: " Hardly any experiment can be imagined which has not already been tried by the hand of nature." But Jeffrey has a truth which however, he has not elaborated successfully. The physical investigator has much more accurate tests than the mental philosopher in the means which modern science has provided for weighing and measuring the results; and this, I apprehend, is the main reason for the fact that there is less disputing about physical than mental laws. On the other hand, we have more immediate, constant, and familiar access to our thoughts and feelings than we have to any facts of natural philosophy; and thus our knowledge of mind, scientific and practical, may, without being so much observed by the vulgar, be as useful as our knowledge of physics, as it may at all times be restraining and constraining us, though unconsciously, and enabling us to sway the minds and actions of others. {346}

XLVI.-SIR JAMES MACKINTOSH.[88]

"I /WAS\ born," he tells us, " at Aldowrie, on the banks of Loch Ness within seven miles of the town of Inverness, in Scotland, on the 26th of October, 1765." His father was a subaltern and younger brother, possessed of a small family property, and his mother was pressed with many anxieties; but she and the whole female kindred combined to lavish kindness upon the child and possibly fondled him too much. In 1775, he was sent to the school at Fortrose. The boarding mistress was very pious and orthodox, and at times rebuked the usher who was suspected of some heretical opinions. He betook himself early to reading thoughtful works, some of them beyond his years, such as Burnet on the Thirty-Nine Articles, and he formed opinions of his own, and became a warm advocate for free-will.

"About the same time," be says,

> "I read the old translation (called Dryden's) of Plutarch's 'Lives' and Echard's 'Roman History.' I well

remember that the perusal of the last led me into a ridiculous habit. from which I shall never be totally free. I used to fancy myself emperor of Constantinople. I distributed offices and provinces amongst my school fellows; I loaded my favorites with dignity and power, and I often made the objects of my dislike feel the weight of my imperial resentment. I carried on the series of political events in solitude for several hours;. I resumed them, and continued them from day to day for months. Ever since, I have been more prone to building castles in the air than most others. My castle-building bas always been of a singular kind. It was not the anticipation of a sanguine disposition, expecting extraordinary success in its pursuits. My disposition is not sanguine, and my visions have generally regarded things as much unconnected with my ordinary pursuits and as little to be expected as the crown of Constantinople at the school of Fortrose. These fancies, indeed, have never amounted to conviction, or, in other words, they have never influenced my actions; but I must confess that they have often been as steady and of as regular recurrence as conviction itself, and that they have sometimes created a little faint expectation, a state of mind in which my wonder that they should be realized would not be so great as it rationally ought to be. The indulgence of this dreaming propensity produces good and bad consequences. It produces indolence, improvidence, cheerfulness; a study is its favorite scene; and I have no doubt that many a man, surrounded by piles of folios and apparently engaged in the most profound researches, is in reality often employed in distributing the offices and provinces of the empire of Constantinople." {347}

The instruction he received at school was loose and far from accurate. " Whatever I have done beyond has been since added by my own irregular reading But no subsequent circumstance could make up for that invaluable habit of vigorous and methodical industry which the indulgence and irregularity of my school life prevented me from acquiring, and of which I have painfully felt the want in every part of my life." In 1780 he went to college at Aberdeen. " I bought and read three or four books this first winter, which were very much out of the course of boys of fifteen anywhere, but most of all at Aberdeen. Among them was Priestley's " Institutes of Natural and Revealed Religion," and Beattie's " Essay on Truth," which confirmed my disposition to metaphysical inquiries, and Warburton's " Divine Legation," which delighted me more than any book I had yet read, and which perhaps tainted my mind with a fondness for the twilight of historical hypothesis, but which certainly inspired me with that passion for investigating the history of opinions which has influenced my reading through life. At the college he formed an intimacy with a most engaging and promising youth, Robert Hall, who afterwards became the most brilliant preacher of his age. " His society and conversation had a great influence on my mind; our controversies were almost unceasing. We lived in the same house, and we were both very disputatious. He led me to the perusal of Jonathan Edwards's book on Free Will, which Dr.

Priestley had pointed out before. I am sorry that I never got the other works of that most extraordinary man, who, in a metaphysical age or country, would certainly have been deemed as much the boast of America as his great countryman Franklin." In their joint studies the two youths read much of Xenophon and Herodotus and more of Plato; and so well was this known -- exciting admiration in some, in others envy- that it was not unusual, as they went along, for their class-fellows to point at them and say: " There go Plato and Herodotus." But the arena in which they met most frequently was that of morals and metaphysics. "After having sharpened their weapons by reading, they often repaired to the spacious sands upon the sea-shore, and still more frequently to the picturesque scenery on the banks of the Don above the old town, to discuss with eagerness the various subjects to which their attention had been directed. There was scarcely an important {348} position in Berkeley's "Minute Philosopher," or Butler's " Analogy," or in Edwards on the Will, over which they had not thus debated with the utmost intensity. Night after night, nay month after month, for two seasons, they met only to study or dispute, yet no unkindly feeling ensued." (Gregory's " Memoir of Robert Hall.")

In 1784 he entered on the study of medicine, and was under the famous Dr. Cullen, but attached himself to the fancies of John Brown, author of the Brunonian system, which had its little day. At Edinburgh he became a member of the famous Speculative Society, which did so much to stimulate the intellectual life of young men. He is able to testify of Edinburgh University, " that it is not easy to conceive a university where industry was more general, where reading was more fashionable, and where indolence and ignorance were more disreputable. Every mind was in a state of fermentation. The direction of mental activity will not indeed be universally approved. It certainly was very much, though not exclusively, pointed towards metaphysical inquiries." To the " Royal Physical Society," he read a paper on the instincts and dispositions of animals, and showed that animals had memory, imagination, and reason in different degrees; declining to enter on the difficult question: "To what circumstance are we to attribute the intellectual superiority of man over other animals?" He took his medical degree with credit, but it does not appear that he ever had the taste for the patient observation of physiological facts which would have made him eminent in the profession. It is quite clear that, while a hard student, he mingled freely in the excesses for which the Edinburgh lawyers and students were noted at that period. It is proper to add that, when in Edinburgh, he attended the lectures of Dugald Stewart, with whom he carried on an occasional correspondence through life.

He was now seized with the disposition attributed to his countrymen of going south when they have to seek a settlement for life, and he went to London in the spring of 1788. There he meant to follow the medical profession, but he was easily turned aside from it. He became deeply interested in the politics of the time, which took their direction from the revolt of the American colonies, and from the fermentation preceding the revolutionary outburst in France. He listened eagerly to the {349} orations of Burke

and Sheridan; and became a speaker him self in one of the numerous political societies of the period. He was led by his social dispositions to mingle in the society that was open to him. "His company was sought after, and few were the occupations which induced him willingly to decline a pleasant invitation." Feeling a difficulty in sustaining him self, he sold his little highland estate, and bravely entered into the state of matrimony. He now betook himself to the study of the law, and, had he kept to it steadily, would undoubtedly have risen to great eminence in certain departments of it requiring thought and lofty eloquence. But an opportunity now presented itself to call forth his special gifts, and enable him at once to rise to distinction.

About this time there was a wide difference of opinion in England in regard to the tendency and influence of the French Revolution. Young minds of a liberal tendency were strongly impressed with the need of political reformation in France. But, as the revolution advanced, not a few who at first favored it became alarmed at the infidelity and the cruel excesses. Burke, in particular, denounced the whole movement in language of extraordinary power and eloquence in his " Reflections." But multitudes were not disposed to abandon the hope which they cherished. Many were the replies to Burke, but they were all feeble compared with that now issued, in April, 1791, -- the " Vindiciae Gallicae," by Mackintosh. The work has not the magnificent glow of Burke; but it is philosophical and eloquent, and had a rapid and wide circulation. At a later date, when some Frenchmen at Paris complimented him on the " Vindiciae Gallicae," he replied: " Messieurs, vous m'avez si bien refute."

In 1795 he was called to the bar, and gradually acquired a considerable practice. But his native tendency was still toward speculation, and in 1799 he delivered a course of thirty-nine "Lectures on the Law of Nature and Nations." This work does not exhaust the grand topic of which it treats; but it was a most important contribution to the science of natural and international law, and furnished ample evidence of the eminently philosophical mind of the author. " The foundation of moral government and its tests he examined at great length and with much acuteness; he entered into a question which, many years after, received from him almost as much elucidation as can be {350} hoped, -- the relation of conscience and utility as the guides of moral conduct; he showed the vanity of every system that would sacrifice the particular affections to general benevolence; the origin and use of rules and of habits to the moral being." Parr wrote him a characteristic letter: " You dog, nobody can do it better; nobody I say, -- not Hume, not Adam Smith, not Burke, not Dugald Stewart; and the only exception I can think of is Lord Bacon. Yet, you dog, I hate you, for you want decision. 0 Jimmy! feel your own powers, assert your dignity, out upon vanity and cherish pride." In writing to Dugald Stewart about the state of philosophical opinion at this time (1802), he says: " One might give a just account of the state of learning at Paris, by saying that the mathematical and physical sciences were very actively and successfully cultivated, polite literature neglected, erudition extinct, and that moral and political

speculation were discountenanced by the government and had ceased to interest the public." " Germany is metaphysically mad. France has made some poor efforts which have ended in little more than the substitution of the word ideology for metaphysics."

His next great effort was his defence of M. Peltier, an emigrant royalist, for a libel on Napoleon Bonaparte, at that time first consul of France. His oration is regarded by some as one of the most eminent displays of forensic eloquence which modern times have produced. But he has now to consider two very important points,-- one is how he is to execute what he intends to make his life-work, and the other is how is he to get a living suited to his tastes and habits. He has all along been cherishing ambitious literary projects, not always very clearly defined, but pointing towards a great work on moral philosophy and a history of England or certain eras of it. But these schemes could not very well be carried into execution by one who had to toil at the bar. And then he was fond of society, and had not sufficient moral restraint to curb expenditure. In these circumstances he was led to accept (1804) the office of Recorder of Bombay, which was handsomely offered by the tory government, and he became Sir James Mackintosh. He thought he would now be able to undertake and complete, as he expressed it, " my intended work on morals and politics, which I consider as the final cause of my existence." But his hopes were not realized. He had not sufficient decision to contend with the relaxing {351} influence of the climate. " Our climate may be endured: but I feel that, by its constant though silent operation, existence is rendered less joyous and even less comfortable. I see around me no extraordinary prevalence of disease, but I see no vigorous cheerful health." He longed for letters from England and wrote letters to his friends which are full of thought. Philosophy is my trade, though I have hitherto been but a poor workman, I observe you touch me with the spur once or twice about my book on morals; I felt it gall me, for I have not begun; and I shall not make any promises to you till I can say that it is well begun: but I tell you what has either really or apparently to myself retarded me; it was the restless desire of thoroughly mastering the <accursed> German philosophy." "It is vain to despise them. Their opinions will, on account of their number and novelty, occupy more pages in the history of philosophy than those of us humble disciples of Locke and Hartley. Besides, their abilities are not really contemptible. It seems to me that I am bound not only to combat these new adversaries, but to explain the principle and ground of their hostility, which is in itself a most curious confutation in detail."

He discharges the duties of his office, and instituted the Literary Society at Bombay and had a plan for forming a comparative vocabulary of Indian languages, read a great number and variety of books, and often writes critiques upon them, some of them distinguished by great ability and worthy of being preserved in a more permanent form than in the memoir written by his son. In philosophy, he reads Reinhold, Tiedemann, and says: " I shall begin with Descartes" `Meditations' and `Objections,' Spinoza, Hobbes on `Human Nature,' Berkeley's `Principles' and `Dialogues,' Hume on

`Human Nature,' then Kant." " The German philosophy, under its present leader Schelling, has reached a degree of darkness in comparison of which Kant was noonday. Kant, indeed, perplexed all Europe; but he is now disdainfully rejected by his countrymen as a superficial and popular writer "! While engaged in this reading, he says: " My nature would have been better consulted, if I had been placed in a quieter situation, where speculation might have been my business, and visions of the fair and good my chief recreation." I venture to affirm that, if be had been placed in such a position, he would not have remained in it a month. He {352} remembers the feelings and projects of his youth, when "my most ardent ambition was to have been a professor of moral philosophy." He writes to Dugald Stewart: " I am now employed in attempting to throw into order some speculations, on the origin of our notions of space and time, of poor Tom Wed wood." "I am very desirous of seeing what you say on the theory of ethics. I am now employed on what the Germans have said on that subject. They agree with you in rejecting the doctrine of personal or public interest, and in considering the moral principle as an ultimate law. I own to you that I am not a whit more being a Kantian than I was before; yet I think much more highly of Kant's philosophical genius than I did when I less comprehended his writings." He reads one hundred pages of Fichte's Lectures on " The Characteristic Features of the present Age," " a very ingenious book with most striking parts." " Finished Fichte, -- a book, certainly, of extraordinary merit, but so mysterious and dogmatical as to be often unintelligible and often offensive. Read one hundred pages of Kieswetter's I Introduction to the Kantian Philosophy.' It is the first clear book on this subject which I have seen." I have given so many extracts from his journal and letters, because they exhibit so vividly the process through which in that age many a young mind had to pass, in trying to cross from the British to the German philosophy.

Thus did he pass eight years of his life. He returned to England in 1812; and, as his opinions had undergone consider able modification since he wrote against Burke, he had flattering political offers from Perceval and Canning. But he conscientiously stuck by his whig friends and whig principles. He was soon in the whirl of London society, the charms of which he could not resist. He and Madame de Stael became for a season the most brilliant conversers in the literary and political circles. " She treats me as the person whom she most delights to honor: I am generally ordered with her to dinner, as one orders beans and bacon; I have in consequence dined with her at the houses of nearly all the cabinet ministers." Through the influence of his whig friends, he became M. P. for the County of Nairn, and in the House of Commons promoted every liberal measure, and, from time to time, made speeches of a very high order,-- in thought, expression, in tone, far above the {353} ordinary level of statesmen. He also wrote miscellaneous articles in the " Edinburgh Review." But what of his cherished work? He had not formally abandoned it. But he had not the courage to resist the pleasures of society, and the excitement of politics, and devote himself to what he knew to be his proper sphere.

Two opportunities presented themselves for returning to his favorite philosophic pursuits. In 1818 he was appointed professor of law and general politics in the college instituted for the education of the civil servants of the East India Company at Haileybury. There he treated of moral science, dividing it into ethics and jurisprudence; and of law, civil, criminal, and constitutional. He did not commit his lectures to writing, and nothing is preserved of them but the barest outline. Another opportunity, and the last, presented itself. On the death of Thomas Brown in May, 1820, he was offered the chair of moral philosophy, in the university of Edinburgh. It was the very place for him. He would have been one of the three mighty men in the capital of Scotland, the others being Walter Scott and Francis Jeffrey. He would have been constrained to complete his philosophical reading, and thoroughly work out his system, and might have left works worthy of being ranked with those of Reid, Stewart, and Hamilton, though not equal to the first and last of these in originality. But he is sucked back into the amenities of London society and the agitations of politics.

He was the favorite of every society he entered, by his good-nature, his urbanity, his extensive knowledge, his keen sense of the ludicrous, his pleasant humor, his good-natured wit, and his profound wisdom. As a parliamentary orator, he was thoughtful, always thoughtful; and thoughtful bearers were pleased to notice that he was evidently thinking as he spoke. His speeches had also the charm of elegant diction and brilliant illustration. But for popular effect they were too candid, and wanted coarseness, invective, satire, and passion. His whig friends never made him a member of the cabinet, and Sir James Scarlet commented: "There is a certain degree of merit which is more convenient for reward than the highest." The students of Glasgow University paid him an appropriate honor when they elected him lord rector. At length be set {354} himself vigorously to write a history of England. The work is calm, candid, full of fine generalizations and analyses of character; but wants liveliness of narrative, and a searching detection of motives, especially bad motives, -- he was too charitable, or, rather, too genial, to believe in human wickedness. His greatest work might have been a " History of the Revolution in England," as he had such a sympathy with the wisdom and moderation of the event , but he left the book unfinished. He was persuaded with some difficulty to write a " Dissertation of the Progress of Ethical Philosophy," for a new edition of the " Encyclopedia Britannica." He took an active part in promoting Catholic emancipation and the Reform Bill. He was now evidently hastening to fulfil the grand work which he had allotted to himself. But he was seized with illness ere he completed it. He had not identified himself much with the religion of Jesus in his life, but he turned to it at his dying hours. His son reports: " He would speak of God with more reverence and awe than I have almost ever met with." "Our Lord Jesus was very frequently the subject of his thoughts; he seemed often perplexed and unable to comprehend much of his history. He once said to me: 'It is a great mystery to me, -- I cannot understand it.' " " His difficulty lay in the account given

of the manner in which he became the Saviour of men." " I said to him at one time: 'Jesus Christ loves you;' he answered slowly and pausing between each word: `Jesus Christ -- love -- the same thing.' After a long silence, he said: `I believe-' We said, in a voice of inquiry: 'In God?' He answered: ' In Jesus.' He spoke but once more after this."

We have very imperfect means of knowing what his philosophy would have been had he fully formed it. We can judge of it only by the skeleton of his lectures at Haileybury, preserved in the Memoir, and by his historical and critical dissertation in the Encyclopaedia. He has a clear idea of the end to be served by ethical science " Not what <is>, but what <ought to be>. Here a new world opens on the mind: the word, the idea, <ought> has no resemblance to any object of natural science; no more than colors to sound, not so much. Both are phenomena. The question by what rules the voluntary actions of men ought to be governed. This important word ought, which represents no fact, is yet intelligible to all mankind; a correspondent term in {355} every language, -- the terms `right,' `wrong,' `moral,' `immoral,' `duty,' `crime,' `virtue,' `vice,' `merit,' `demerit,' distinguished and contrasted." He has evidently kept three ends before him in his " Dissertation: " The progress of the science, especially during the two previous centuries a critical examination of the more eminent ethical writers and an exposition of his own views. These three ends are not kept separate, but run through the whole work. We may first take a cursory view of the historical exposition, and then critically examine his own theory.

He has a retrospect of ancient ethics. His sketches are not equal to those of Adam Smith in his "Theory of Moral Sentiments," but are worthy of being placed near them. They are not very erudite or very profound, but they are by no means superficial. He can sketch admirably the practical tendency of a philosophic system such as that of the Stoics. He has then a retrospect of scholastic ethics. It could scarcely be expected of a whig that he should have much reverence for mediaeval times; but, in his treatment of the schoolmen, he is appreciative in the highest degree of their excellencies. It is evident that he has not that thorough acquaintance with their discussions and individual opinions which later research on the part of historians of philosophy and of the church might have enabled him to attain. He enters on a more congenial theme when he comes to modern times.

He begins with Grotius and Hobbes, of both of whom he has a high admiration, but remarks of Hobbes' system, that " a theory of man which comprehends in its explanations neither the social affections nor the moral sentiments must be owned to be sufficiently defective." He then enters on the controversies concerning the moral faculties and social affections, and gives a critical exposition of Cumberland, Cudworth, Clarke, Shaftesbury, Bossuet, Fenelon, Leibnitz, Malebranche, Edwards, and Buffier. He has formed a higher estimate of the merits of Edwards than most Europeans, whether British or German. He had studied the " Treatise on the Will " when a student in Aberdeen, and he favors the view taken by Edwards that virtue consists in love to being

as being, according as being has claims on it. But whence the claims of being? An answer to this question must bring us, whether we wish or no, to an ethical {356} principle guiding the direction and flow of the affection. The discussion by Edwards is certainly a very profound one, and he brings out deep truths of which Mackintosh did not discover the importance.

He goes on to men who are represented as laying the foundations of a more just theory of ethics; that is, as approaching nearer the theory of Mackintosh. He gives just and valuable accounts of the systems of Butler, Hutcheson, Berkeley, Hume, Smith, Price, Hartley, Tucker, Paley, Bentham, Stewart, and Brown. He perhaps, exaggerates the originality of Butler, who was much indebted to Shaftesbury, but passed far beyond him in maintaining the supremacy of conscience. " In these sermons he has taught truths more capable of being exactly distinguished from the doctrines of his predecessors, more satisfactorily established by him, more comprehensively applied to particulars, more rationally connected with each other, and, therefore, more worthy of the name of discovery, than any with which we are acquainted; if we ought not, with some hesitation, to accept the first steps of Grecian philosophy towards a theory of morals." Mackintosh does not seem to be aware that, lofty as was Berkeley's idealism in its moral tone, his ethical system is based on pleasure as the ultimate good. " Sensual pleasure is the <summum bonum>. This is the great principle of morality. This once rightly understood, all the doctrines, even the severest of the gospels, may clearly be demonstrated. Sensual pleasures, qua pleasure, is good and desirable by a wise man. But if it be contemptible, 'tis not <qua> pleasure, but <qua> pain, or (which is the same thing) of loss of greater pleasure." (" Berkeley's Works, by Fraser, vol. iv. 457). He has a great admiration of Hartley, but points out his defects. ,The work of Dr. Hartley entitled `Observations on Man' is distinguished by an uncommon union of originality with modesty in unfolding a simple and fruitful principle of human nature. It is disfigured by the ab surd affectation of mathematical forms then prevalent; and it is encumbered by a mass of physiological speculations, ground less, or at best uncertain." He was particularly struck with the shrewdness and graphic though homely illustrations of Tucker, who was always a great favorite with him. He criticises Bentham at considerable length. He blames him, in particular, for maintaining that, " because the principle of utility {357} forms a necessary part of every moral theory, it ought therefore to be the chief motive of human conduct." But he has not seized on the fundamental defect in Bentham's theory, for he himself has so far given in to it by reckoning tendency to produce happiness as the constituent of virtue. As setting so high a value on the social affections, he was specially offended with Mr. James Mill, who" derives the whole theory of government from the single fact that every man pursues his interest when he knows it."

Altogether, these sketches have not the calm wisdom nor some of the other admirable qualities of those drawn by Dugald Stewart, who had evidently devoted his life to the study, and contemplated the subject on all sides. But they

are often searching, generally just, and always candid, sympathetic, and comprehensive.

He criticises the ethical writers, as we might expect, by a standard of his own, which is ever cropping out, and at the close of his dissertation he expounds his own theory. He insists, very properly, on a distinction being drawn between the inquiry into right and wrong, and into the mental power which discerns them. In answer to the first, he maintains that virtue consists in beneficial tendency, and to the second that it consists of a class of feelings gendered by association. In both these points, he goes a step in the descending progress beyond Brown, who makes moral good a simple unresolvable quality, and the feeling of moral approbation an original one. I propose to consider both these points in the reverse order to that which he follows.

(1) He lays down the principle that morality is not affected by the way in which we explain the rise of the moral emotion, whether we trace it to moral reason, to an original feeling, or to association. I am not prepared to give in to this. If it is to be ascribed with Brown to mere feeling, it will always be competent to argue that the distinction between good and evil depends on human temperament, and does not imply an original, a necessary, and eternal distinction between good and evil. If it is regarded with Mackintosh, as a mere feeling gendered by association, then it is simply the product of circumstances, and may shift with circumstances. It is vain on this theory to appeal, as Mackintosh would wish to do, to conscience as having {358} authority, and supreme authority; it has merely the authority of association, and cannot claim the authority of God, or even of our essential constitution. I rather think that Mackintosh would have shrunk from his doctrine, had he foreseen how physiologists, by means of heredity and undesigned natural selection, manufacture moral feeling out of animal sensations. The authority of conscience depends on the source from which it is derived.

According to Brown, conscience is a mere class of feelings, and Mackintosh follows him. But Mackintosh makes the feelings to be gendered by association. In order to support this theory, he is obliged to give to association a larger power than was given to it even by Brown. He correct, the erroneous but prevalent notion, that the law of association produces only such a close union of thought as gives one the power of reviving the other; " and insists that " it forms them into a new compound, in which the properties of the component parts are no longer discoverable, and which may itself become a substantive principle of human nature. They supposed the condition, produced by its power, to resemble that of material substances in a state of mechanical diffusion; whereas, in reality, it may be better likened to a chemical combination of the same substances from which a totally new product arises" (Sect.VII). But what does he mean by association? I suppose merely the succession of ideas. The laws of the association of ideas are merely the laws of their succession. It is quite a straining of the word to give association the power of creating a new idea. We place oxygen and hydrogen in a certain relation to each other, and

water is the product; and the water possesses properties not discernible in the elements separately. But chemists do not ascribe this to the mere association of the two: they derive it from the properties of the oxygen and the hydrogen. In like manner when a new idea springs up, we are not to attribute it to the association of feelings, but to a property of the feelings, a property proceeding from a power actual or potential. We have thus to go back to a power deeper and more fundamental, and to get a source of ideas, not in mere association, but in the <intellectus ipse> of Leibnitz, or in the feelings themselves; and this is the moral power.

(2) If we thus prove that there is an original moral faculty {359} of the nature of moral perception, discerning between good and evil, we are in a position to settle the further question: Whether virtue can be resolved into benevolence? Mackintosh stands up for the existence and authority of conscience as a class of feeling. He holds that our business is to follow conscience, even when we do not see the consequences of the acts we perform. But what is the common quality in the acts which conscience approves of? He maintains that, in the last resort, it is beneficial tendency which distinguishes virtuous acts, and dispositions from those which we call vicious. He allows that the virtuous man may not see the beneficial consequences of the acts he performs, that the man who speaks truth may never think that to speak truth leads to happiness: he does it simply because it is right. Still, if we inquire into it, it will be found that beneficial tendency is the essential quality in virtuous acts. I dispute this statement, appealing to conscience as the arbiter. For conscience affirms that justice, that veracity, that candor, are good, quite as much so as benevolence itself, and it is difficult, I believe impossible, to resolve justice and the virtues embraced under it, such as veracity and the love of truth, into benevolence.

Altogether Sir James Mackintosh never fulfilled the expectations that were formed by Robert Hall and his other friends. He went from medicine to law, and from law to politics; and with first-rate intellectual powers, failed to reach the highest positions in any one of these departments. He was without firmness of purpose to resist temptation and concentrate his energies on what he acknowledged to be his life-work, and so was at the mercy of circumstances, and attained the highest eminence only as a <talker> in the best social circles of London, where he had a perpetual stimulus to excel. If he had only had the courage to devote himself to what he knew to be his forte, but which could not bring him immediate fame; had he read systematically, instead of discursively, and made himself as well acquainted with the higher forms of the Greek and German philosophy, as he did with the later forms and of British philosophy, -- he might have ranked with the highest thinkers of his age, As it is he has left us little that will endure beyond these able and candid sketches of ethical writers. {360}

XLVII. -- HENRY (LORD) BROUGHAM.[89]

L/ORD\ B/ROUGHAM\ was born in Scotland, was the son of

a Scotch mother, was trained in the Scotch metaphysics, and employed them with advantage in his work on natural theology, and was swayed by them, often unconsciously, in his addresses at scientific associations, in his speeches, his sketches of statesmen and philosophers, and in his legal opinions and decisions which, when they relate to moral themes, are evidently founded on sound ethical principles, caught from Stewart and the Scottish professors. We are therefore entitled to claim him as belonging to the fraternity.

He was born in Edinburgh, September, 1779. His father was Henry Brougham, of Brougham Hall, Westmoreland, who came to Edinburgh after the death of his first wife, and there married Eleanor Lyme, a niece of Principal Robertson, the historian. He was educated at the high school of Edinburgh, where he early showed his great capacity and his power of application. At the university he devoted himself closely and systematically to higher learning, and at times took excessive fits of study. If tradition speaks true, he had also fits of drinking, from the visible effects of which he was kept by his strong mind and bodily constitution. He attended Dugald Stewart's lectures; and we see traces of a happy influence produced on his restless temper by the calm, moral wisdom of that true philosopher and great teacher. But he was specially addicted to physical and mathematical studies, and profited greatly by the instructions of Play fair, Black, and Robison. " Great as was the pleasure and solid advantage of studying under such men as Playfair and Stewart, the gratification of attending one of Black's last courses exceeded all I ever enjoyed." At a very early age, from sixteen to twenty, he had papers on optics and porisms inserted in the " Philosophical Transactions " of Edinburgh. He acquired at this time an immense body of information which be turned to profitable use as a pleader and a statesman, and which greatly increased his usefulness. No doubt his admirers ascribed to him, and he probably ascribed to himself, a larger amount of learning than he really possessed: still he had attained and mastered a vast amount of real knowledge. He continued all his life an ardent and laborious student; and he had laid, in his college days, a solid foundation on which to build his acquirements.

He became, as we might expect, a stirring member of the Speculative Society, which at that time embraced, among its younger members, Jeffrey, Horner, Murray, Moncreiff, Miller, Loch, Adam, Cockburn, Jardine, Charles (afterwards Lord) Kinnaird, Lord Webb Seymour, and at a some what later date the two Grants, Glenelg and his brother Sir Robert. " After the day's work we would adjourn to the Apollo Club, where the orgies were more of the 'high jinks' than of the calm or philosophical debating order, or to Johnny Dow's, celebrated for oysters. Sometimes, if not generally, these nocturnal meetings had endings that in no small degree {361} disturbed the tranquillity of the good town of Edinburgh." He became a member of the Society of Advocates in 1800, and in 1808 he was called to the bar at Lincoln's Inn, London. The profession was at first distasteful to him in the highest degree, but he soon got reconciled to it when it brought him into scenes of excitement, as when he became counsellor to the Princess Caroline, and earned such fame by his defence

of her.

There would be no propriety in our entering into the details of his London life, where he espoused the liberal side in politics, became member of parliament, and compelled all men to acknowledge at once that he was a debater of extraordinary power. His eloquence was of a very marked kind, full, elaborate, yet pointed and telling. His sentences were complex, often taking in a mighty sweep of arguments and facts; and people wondered how lie was ever to get out of the labyrinth in which he had involved himself, but in the end he always came out perspicuous. His clear arrangement of a difficult subject, the fulness of his information, gained the judgment, while his massive language made the whole argument come down with the power of a sledge-hammer, His speeches did resemble thunder quite as much as those of any modern orator; and if Demosthenes "fulmined" over Greece, Brougham "fulmined" over Westminster Hall and St. Stephen's, and popular meetings all over England. His sarcasm was very biting and his invective terrific, and the effect was increased by a nervous curl of the lip, resembling the snarl of a dog. He had every quality of a great orator except tenderness and pathos.

He was a powerful (the most powerful in his day) advocate of every measure of reform, political and social. He uttered the most withering denunciations of slavery; he advocated law reform, and parliamentary reform, and took a deep interest in education and in all social questions, -- becoming president of the Social Science Congress. But perhaps his greatest work was the formation of the Society for the Diffusion of Useful Knowledge, which did so much to extend a knowledge of literature and science and promote reading among the people.

His vast powers, however, were greatly marred by certain weaknesses. He was impelled by a fiery intellect to constant labor, and was often busy when he might have carried his point more effectively by retiring. He was intensely fond of popular applause, -- partly through his sympathy with man kind, and often sought fame in quarters where he got only infamy. All this wrought in him a restlessness and an inequality of temper; and his party, even his friends, complained that they could not trust him. When the Whigs carried the Reform Bill he was made Lord Chancellor, -- unfortunately for himself, for be had not all the qualities necessary to make a dignified and a wise supreme judge in a great country with such complicated interests. His predecessor, Lord Eldon, had hesitated and delayed in his judgments, so that there was an immense accumulation of undecided cases; and Brougham cleared them all off in an amazingly brief time. Many of his decisions were reckoned rash by the wisest lawyers; but his opinions in all cases involving equity -- in which he had been instructed by his ethical training in Edinburgh -- will ever be reckoned of great value. As he had excessive self-will and little prudence, his colleagues were in a constant {362} state of alarm as to what he might do next. They felt that he was dragging the Great Seal through the dirt in a tour which he took through Scotland, receiving congratulations from quarters which did not add to his dignity.[90] At one

of his meetings he boasted that he would write that evening to his sovereign, King William, telling him how great was the honor which bad been conferred on him. His colleagues took advantage of the occasion to part with him, and henceforth he held a somewhat ambiguous position in political life; cast off by the liberals and not willing to join the tories, not withstanding his excessive admiration of the Duke of Wellington and Lord Lyndhurst. Still he led a useful life, helping on every educational cause, such as Mechanics' Institutes and the London University.

He was elected, as so many eminent men have been, lord rector of Glasgow University, and delivered, in 1825, a very able and elaborate defence of learning; but declared that man is no more responsible for his belief than for the color of his skin. He may have imagined that the supporters of Calvinism would not frown on such a doctrine; but he was immediately met by Chalmers, Wardlaw, and a host of others, who could not stand such a perversion of the doctrine of necessity, and who showed that the will had much to do with the formation of opinions, for which man, therefore, was responsible, if not to his neighbors, at least to God.

Prompted by a boundless ambition and activity of mind, he threw him self into an infinite number and variety of works, in no one of which, except oratory, did he reach the highest eminence. He continued to cultivate science, physical and mathematical, but had not leisure nor patience to widen the boundaries of any one department. He wrote innumerable articles and papers, especially sketches of statesmen and philosophers. These are always able, candid, kindly, but are deficient in delicate appreciation of character and motive. In his later years he employed a portion of his time in writing an autobiography.

He had been all along an able defender of the great truths of natural religion. He had spoken with reverence of the scriptures, and delighted to show that the theology of nature had sustained revelation. But it was only in his later days that be seemed thoroughly to bow down before God. it is believed that he was much affected by a change which bad taken place in the character of Lord Lyndhurst, whose clear and sharp intellect he so much admired. Certain it is that in old age he gave forth utterances which show that be was thoroughly penetrated with the importance of divine realities. He spent a good deal of his later life at Cannes, and died there May 9, 1868.

I believe that there is a philosophy-underlying most of the criticisms, {363} and even the orations, of Brougham. His metaphysical principles especially appear in his "Discourse on Natural Theology," prefixed to his edition of Paley a work executed when he held the Great Seal of England. This discourse professes to be logical, but does not throw much light on the method of inquiry, or on the nexus of the parts of the theistic argument. He professes to proceed throughout on the method of Bacon, of whom he entertained, as all the Scottish metaphysicians did, a high admiration. He maintains that natural theology " is strictly a branch of inductive theology, formed and supported by the same kind of reasoning upon which the physical and

psychological sciences are founded." He argues that " the two inquiries, that into the nature and constitution of the universe and that into the evidence of design which it displays, are to a large extent identical." Turning to psychology, he expresses his wonder that writers in modern times have confined themselves to the proofs afforded by the visible and sensible works of nature, while the evidence furnished by the mind and its operations has been neglected. " The structure of the mind, in every way in which we can regard it, affords evidence of the most skilful contrivance. All that adapts it so admirably to the operations which it performs, all its faculties, are plainly means working to an end." He refers in proof to the processes involved in reasoning, association, habit, memory, and to the feelings and affections so adapted to their end. In speaking of habit, he gives a powerful description of what no doubt was his own experience as a speaker. " A practised orator will declaim in measured and in various periods; will weave his discourse into one texture; form parentheses within parentheses; excite the passions or move to laughter; take a turn in his discourse from an accidental interruption, making it the topic of his rhetoric for five minutes to come, and pursuing in like manner the new illustrations to which it gives rise; mould his diction with a view to attain or to shun an epigrammatic point, or an alliteration, or a discord; and all this with so much assured reliance on his own powers, and with such perfect ease to himself, that be will even plan the next sentence while he is pronouncing off-hand the one be is engaged with, adapting each to the other, and shall look forward to the topic which is to follow, and fit in the close of the one he is handling to be its introducer; nor will any auditor be able to discover the least difference between all this and the portion of his speech he has got by heart or mark the transition from the one to the other." I do believe that there is proof of design in the structure of a mind that is capable of bringing forth such products; but to ascribe all this to habit while there are a great many other principles involved, argues a defective power of mental analysis on the part of our author. He thinks to the ordinary argument an addition of great importance remains to be made. " The whole reasoning proceeds necessarily upon the assumption that there exists a being or thing separate from and independent of matter and conscious of its own existence, which we call mind." So he sets him self against materialism.

He sets no great value on the argument <a priori>, and examines it, not very powerfully, in the form in which it is put by Clarke. He admits, how ever, that, after we have, by the argument <a posteriori>, "satisfied ourselves {364} of the existence of the intelligent cause, we naturally connect with this cause those impressions which we have derived from the contemplation of infinite space and endless duration, and hence we clothe with the attributes of immensity and eternity the awful Being whose existence has been proved by a more vigorous process of investigation." Brougham, it is evident, was ignorant of the terrible criticism to which the theistic argument bad been subjected half a century before by Kant, with whose philosophy he seems to have been utterly unacquainted. He does not see clearly what Kant bad proven, that the <a priori> principle of cause and effect is

involved in the argument from design. We look on design as an effect, and infer a designer as a cause, on the principle that every effect has a cause. At the same time he treats of cause and effect. " Whence do we derive it? I apprehend only from our consciousness. We feel that we have a will and a power; that we can move a limb. and effect, by our own powers excited after our own volition, a change upon external objects. Now from this consciousness we derive the idea of power, and we transfer this idea and the relation on which it is founded, between our own will and the change produced, to the relations between events wholly external to ourselves, assuming them to be connected as we feel our volition and our movements are mutually connected. If it be said that this idea by no means involves that of necessary connection, nothing can be more certain. The whole is a question of fact, -- of contingent truth." This statement is exposed to criticism. Whence this transference of what we feel, or rather the legitimate application of it, to the objective world? If there be not a necessary principle involved, how are we entitled to argue that world-making, of which we have no experience, implies a world-maker. He argues in behalf of the immortality of the soul, and that it is quite possible to prove a miracle. It has to be added that be has some papers on instinct, on which he throws no great light as he had not caught the idea that instinct is the beginning of intelligence, and that it is capable, within a limited degree, of being cultivated and made hereditary.

XLVIII.-- JAMES MYLNE.

IT is a curious circumstance that systems of philosophy so like each other should have been formed, simultaneously in the end of last century, and propounded at the beginning of this, by three men so different in temperament as James Mylne of Glasgow, Thomas Brown of Edinburgh, and James Mill of London. But the phenomenon can be explained. They could not have borrowed from each other, but they felt a common influence. All felt that Hume had undermined a great many received principles, that Hartley had resolved into association many operations of the mind before referred to independent faculties; all three, but especially Mylne and {365} Brown, were acquainted with the analyses of Condillac, De Tutt Tracy, and the ideologists of France; and all lived under the reaction against the excessive multiplication of first principles by Reid and Stewart. Of the three, Brown had the greatest genius and the keenest analytical power; Mill, of London, the greatest tenacity of purpose, of consistency, and in the end of influence: but, Mylne, of Glasgow, had quite as much of searching ability as either of the others. He died without publishing any philosophic work but for upwards of forty years he delivered to large classes in Glasgow a course of lectures which set many minds a working There was nothing attractive, certainly nothing stimulating, in his manner, his language, or his system; but the author of this work remembers him, as he lectured every winter morning at half-past seven in the dingy old class-room in Glasgow College, as the very embodiment and personification of wisdom, which had viewed a subject on all sides and looked it through and through.

He was the son of the Rev. James Mylne, of Kinnaird, near Dundee; was born in the same shire as James Mill of London; was licensed to preach in 1779; was soon after ordained as deputy chaplain Of 83d Foot; and admitted minister of the Abbey Church, Paisley, in 1783. He was appointed professor of philosophy in Glasgow College in 1797, resigned on the 3d and died on the 21st Of September, 1839. His business was to preach or provide preachers for the students in the college chapel. The students felt his preaching and that of his substitutes to be cold, and regarded him as secretly a rationalist or a Socinian. After the revival of evangelical faith in the city of Glasgow under Chalmers, loud complaints were uttered as to the doctrine taught in the college chapel.

Opposed to the national creed of Scotland, and an adherent of liberal principles, he was regarded as a dangerous man by the government of the day. On Sunday, March 26, 1815, news came of the escape of Bonaparte from Elba, and in the chapel he happened to give out the paraphrase used in the Scotch worship, " Behold, be comes ! your leader comes! " and it was interpreted as a welcome to the restored emperor, and he was subjected to a prosecution by the Lord Advocate. He answered with spirit in a pamphlet, " Statement of the Facts connected with a Precognition taken in the College on March 30 and 31, 1815." He speaks of Bonaparte as "a man whom he had long regarded with sentiments of the deepest abhorrence and detestation, not only as the disturber of the peace and happiness of nations, but as the greatest enemy to the civil and political liberties of mankind."

His philosophy was a sufficiently simple one: he made it very clear, and he saw no difficulties. There are three, and only three, faculties of the mind, -- sensation, memory, and judgment. With certain explanations he adopts the principle "nihil in intellectu quod non prius fuerit in sensu." He sees that it may be necessary to have a separation of the senses usually represented as touch, gone sense to receive sensations from solids, and another from such qualities as heat. He does not get rid of memory so readily as Brown and Mill. He opposes the theory of the French philosophers who affirm that memory is a mere modification of former impressions, and from Hume who makes conceptions differ merely in degrees from sensation. The eye, indeed, after long looking at a bright object, when shut retains {366} the brightness; but this, lie argues, is a proof that memory is not a sensation, for frequently, at the very time the spectrum, as it is called, remains in the eye, we can remember that it is not the same. He is obliged to make judgment a separate faculty; but then it consists merely in perceiving the difference of feelings. He starts the question, whether our ideas are images of external objects, and answers that external objects are rather pictures of our sensations. He distinguishes between ideas and sensations. An idea is a feeling in the mind which it has distinguished and recognized as different from the other feelings, and feeling becomes an idea as soon as this distinction is made.

It seems to him easy to explain all the operations of the mind by these three faculties. He accounts for attention by showing that some of our sensations and feelings are more strong and lively than others. He thinks the laws of association may be reduced to two, -- contiguity and (taking the hint from Stewart) relationship. As most of our perceptions are furnished in combinations, no wonder that they are again brought together before the mind in combination. But the associations of relationship are much more numerous than those of contiguity. Abstraction is nothing more than the attention directed in a particular way. He explains the peculiarity of habit by the circumstance that, by the frequent repetition of an action, we become acquainted with all the means necessary towards its accomplishment. This is surely not the whole truth, for habit is often carried on without any exercise of will; but there may be some truth in his idea that there may be volitions which are not remembered. Feelings are nothing but modifications of sensation, -- the effect of sensations. Conscience is a decision of the judgment, accompanied in many cases by strong and vivid emotions. Desire is the conception of an object as good, as absent, and as attainable. He succeeds in this cool way to account for all the deeper and higher acts and ideas of the mind; but it is by simply overlooking their Peculiar and distinguishing properties.

He dwells at length on principles of action. The ultimate principle is a desire to secure pleasure and avoid pain. He traces the intellectual operation of conception in all affections and passions, following out the Stoic resolution of passion as developed by the representative of Stoicism in Cicero's "Tusculan Disputations" (lib. iv.),[91] and by which they thought that passion might be brought thoroughly under the control of judgment by a proper regulation of the conception. The Stoic moralists and Mylne did service to philosophy by giving the proper place to the idea or conception; but then he does not see that the conception must be of something appetible or inappetible, derived from a spring of action in the heart or will. He has a good division of the affections into: (1) Those in which the object of them is regarded as in possession, including joy and all its modifications; (2) Those in which the object is absent, though attainable: this produces desire; (3) Those in which the object either already attained, or about to be attained, is produced by ourselves, which produces self-satisfaction; (4) Those in which the agency of others is concerned, giving rise to affection and esteem. He held firmly by the doctrine of philosophical necessity in its sternest and most unrelenting form. Altogether, he had much of the character of an old Stoic philosopher, but without those lofty ideas about following nature and the will and decree of God which elevated the systems of Zeno, Cleanthes, Epictetus, and Marcus Aurelius.

XLIX.-- JOHN YOUNG.[92]

T/WO\ pupils of Professor Mylne's created and sustained for a number of years a strong taste for mental science in the Irish province of Ulster, from which the founder of the

Scottish philosophy bad come. These were professors in the Belfast College, which imparted a high and useful education to the young men of the north-east of Ireland for a considerable number of years, and till it gave way to Queen's College, Belfast. One of these was John Young, professor of moral philosophy, and the other William Cairns, professor of logic and belles-lettres.

John Young was the son of a seceder elder, and was born in Rutherglen in the neighborhood of Glasgow in 1781. He early showed, in the midst of business pursuits, a taste for reading of a high order, for composition, and for spouting. He had difficulties n getting a learned education; but he taught a school, became a clerk in a bleach-field in the neighborhood, and then in a mercantile house in Glasgow; and struggled on, as many a Scotch youth has done, till in 1808, at the age of twenty-seven, he became a student in the University of Glasgow, where he distinguished himself in the classes of logic and moral philosophy, taught by Professors Jardine and Mylne, and took an active part in the college societies, where be displayed, as was thought, extraordinary eloquence. He next attended the divinity hall in the university, and, losing his faith in the stern principles of the seceders, bad his thoughts directed towards the ministry in the established church. But his destination was fixed when, in 1815, the spirited inhabitants of Belfast set up the Belfast Academical Institution, embracing a college. Mr. Young, on the recommendation of the Glasgow professors, was appointed professor of moral philosophy.

Belfast was at that time a much smaller place than it is now, but a place of great enterprise; and among its merchants, its flax spinners, its linen manufacturers, and its ministers of religion, it had a body, if not of very refined yet of very intelligent men, many of them inclined to the Unitarian, or non-subscribing faith; and these men desired to have a good education {368} for their sons, and were proud of the pleasant, the accomplished, and public-spirited man who now came to live among them. His manners were genial; he had acquired a very varied knowledge; he was a ready and instructive talker and an eloquent speaker. The consequence was that he became a favorite in the best society of the place, and, it is to be added, spent too much of his time in dining out, and in entertaining the citizens by his humor and his sparkling conversation.

But he was an able and a most successful teacher, expounding his views with great clearness and fire, and creating a taste for the study, even among the mercantile classes, but especially among the ministers of religion, subscribing and non-subscribing, in Ulster. His lectures were at first carefully written out; but, as years rolled on, he became less dependent on his papers, and expanded like a flood on his favorite topics, and had difficulty in compressing his superabundant matter in the limited course allowed him. He collected for the college a vast number of books published from the time of Locke down to his own day in mental philosophy: these were subsequently bought by the Queen's College. He continued a popular and useful member of society and of his college down to his death, March 9,1829. His lectures were edited by his colleague, Dr. Cairns, and

published in 1834. These published lectures scarcely do justice to him, as they are taken from his manuscripts written in the early years of his college life, and do not contain the oral illustrations and emendations which be was accustomed to pour forth from day to day in his class-room.

At the basis of his whole system, we discover the threefold division of the intellectual faculties by Mylne into sensation, memory, and judgment. Yet his lectures were of a more quickening and comprehensive character than those of his preceptor. We discover, too. that as Dr. Brown's views were given to the world, Professor Young grafted many of the living buds of that ingenious analyst on the old and drier stock. He is obliged like Stewart, and unlike Mylne, -- who used to speak of that "undescribed and undescribable faculty of the mind" denominated common sense, -- to call in fundamental laws of belief, and places among these causation and personal identity. "Experience itself does not reveal to reason the relation of cause and effect." "Cause is not that only which in a particular instance precedes a change; but that which, in similar circumstances, we believe must always have been followed by a similar change, and will always be so followed in future: our belief in the relation of cause and effect thus presents us with a universal truth." "The belief is irresistible and is derived from an instinctive principle in our nature." He says "another important idea connected with the fundamental laws of belief is that of personal identity." " If we ask why each of us believes in his own identity, or regards the feelings which he formerly experienced as belonging to the same person which he now calls himself, does not the very statement of the question show its absurdity? Is it not obvious that, even in the casual expressions which we employ, we take the fact for granted by the use of the pronouns, I and he? It is to be referred. therefore, to a primary law of our nature."

He dwells fondly on the senses, in the operation of which he took a keen {369} interest. He holds that, in perception, there is involved sensation, memory, and judgment. There are sensations; they are remembered; and then a judgment pronounced that the sensations must have a cause, which cause is body. "All our sensations are connected with the conviction of certain external things as their cause; and things which are independent of us, because we cannot command their existence by our volition." "We not only believe that, in the act of perception, we are conscious of knowing two different things, matter and mind, which are at the moment distinct; but we believe that they are permanently distinct and independent." It is not very clear to me how he reaches this result. He seems to refer it, like Reid and Hamilton, to an original belief. "The belief is of the same kind and rests on the same grounds with our belief in the permanence of the laws of nature." (Lect. L.) l believe the principle he appeals to, is that of cause and effect. and he hold-- that we are bound by our very constitution to believe that every effect has a cause. This might entitle him to argue, by this instinctive principle of causation, that our sensations, having no cause within the mind, must have a cause without the mind; if indeed we could in such circumstances rise to the idea of a Without. But lie knows that what a cause is we must learn

from experience; and from a sensation, which is unextended, we could never reach the idea of any thing extended. But our idea of body is of something extended; and we never can reach this except by some original perception as is maintained by Reid and Hamilton. He is thus in all the difficulties of the inferential theory, in the illogical process of arguing from something unextended within to an extended existence without.

He argues powerfully that our knowledge of motion is prior to our knowledge of extension, and that, in motion, there is implied time and the observation of the succession of our thoughts.

L. -- WILLIAM CAIRNS.

T/HE\ Belfast College was modelled on the Scotch colleges, and was meant to give a liberal education to a large body of students. Dr. Cairns was the professor of logic and belles-lettres. He was born in Calton, in the suburbs of Glasgow, about 1780-85. His father was so anxious he should be a scholar that he carried him in his arms to his first school. He received his higher education in the grammar-school and the college of Glasgow, took license as a preacher in connection with the secession church about 1804, and was ordained a minister in Johnshaven in 1806. From his known intellectual ability, he was appointed professor of Belfast in 1815, and continued to give instruction there till his death in 1848. His knowledge of English and classics was extensive, his taste pure and highly refined, and his reading and elocution of a high order. He was greatly respected by all for his talents and accomplishments; he endeared himself to his friends, and was {370} greatly beloved in his family circle. He took great pains in instructing his pupils in the art of English composition, and helped to produce a fine taste among the ministers of religion and the educated men of Ulster. His nature was too sensitive, and the younger pupils took advantage of this infirmity to irritate him and disturb the class. In his later days the institution with which he was connected was greatly disquieted by disputes between the Trinitarians, who composed the great body of the people, and the Unitarians, who had the chief control of the school and college; and Dr. Cairns was often in great perplexity, as he was a man of liberal spirit on the one hand, and a firm supporter of evangelical religion on the other. The breach was not heated till the institution of Queen's College, in 1849.

He published an elaborate treatise on " Moral Freedom," 1844. It is not easy to give an analysis of it: in fact it is not easy to understand it. He starts with the very defective view, for which the teaching of Mylne of Glasgow had prepared him, that all the mental phenomena consist of sensations and ideas, a doctrine which James Mill of London was contemporaneously turning to a very different purpose. He finds a difficulty in rearing his loftier view of man's spiritual nature on such a basis. He dwells fondly on a principle of particular reference and comparative survey as

the highest intellectual exercises, carrying us upward to volition, motive, and moral freedom. He is resolute in claiming for man an essential freedom; and opposes Edwards and those divines who, as Chalmers, were connecting the philosophical doctrine of necessity with the Scripture doctrine of predestination. He regards it as a contracted view to indentify moral freedom and freedom of will. He finds moral freedom not in mere volition, but in the great influential principle of comparative survey. He unfolds, not very clearly, a whole theory of human nature. The truth in his system seems to be, that more is involved in moral freedom than mere volition , that the whole soul, including the intellect, is involved in it; and that a preferential feeling, as he calls it, is an essential part of it, -- pointing to the fact that there may be preference or choice not amounting to full volition, but implying responsibility. He shows that the freedom he advocates may be compatible with divine foreknowledge.

LI. -- JAMES MILL.[93]

T/HE\ author, as he writes this article, has before him a photograph of a house which stood at Upper North Water Bridge, on the south side of the North Esk River, which there divides Angus from Mearns, and flows into the German Ocean a few miles below. The house consists of two apartments "a but and a ben," with possibly a closet, and a lower addition at one end {371} for a workshop. Here, a hundred years ago, lived a shoemaker, named James Mill, with several men under him; he was also a crofter farming some acres of land. His wife was Isabel Fenton, said to have been a woman of superior manners and intelligence, the daughter of a farmer who was out in the forty-five" on the pretender's side. In this house on April 6, 1773, was born James Mill, destined to exercise such an influence on thought. He was one of a family of three, having a brother William, who died young; and a sister Marjory, who married William Greig, who succeeded to her father's trade and left descendants in the district. He seems to have been educated at the school of his native parish, Logie-Pert. His abilities were discovered by his minister, Rev. Dr. Peter, of Logie-Pert, and by Rev. James Foote,[94] of Fettercairn, some miles off, where was the family seat of Sir John Stuart, to whose notice Dr. Foote introduced him; and he was sent to the university of Edinburgh, his son says, " at the expense of a fund established by Lady Jane Stuart [the wife of Sir John Stuart], and some other ladies for educating young men for the ministry." In the university of Edinburgh, he pursued the usual course in arts and theology, and attended the lectures of Dugald Stewart. We have no account of his student's life or his preacher's life;[95] for he became a licentiate of the Church of Scotland. " or a few years he was a private tutor in various families in Scotland, among others that of the Marquis of Tweeddale." He expected, it is said, to receive a presentation to the parish church of Craig, which, however, was given to Dr. James Brewster, brother to (the afterwards) Sir David Brewster. People may speculate as to what sort of minister in faith and practice he would have become, had he been settled in that country parish of farmers and fishers.

We may believe that at no time had the ministry of the gospel any particular charm for him. In the year 1800, he went to London, where it is said that he preached in the Presbyterian churches. But he soon devoted himself to literature and authorship. {372} We do not know to which of the two strong parties in the church of Scotland he had attached himself, whether to the moderate or rationalistic, -- which Burns and most literary men favored,-or to the evangelical, to which Dr. Peter and Mr. James Foote belonged. It is not uncommon for Scotchmen, when they bury themselves in London, to lose their religious faith, which is so sustained by public opinion-as Mill would have said by association of ideas -- in their native land. With his usual reticence he has not furnished us with any account of the struggle which must have passed in his mind when he abandoned his belief, not only in the Bible, but in the very existence of God and providence. Such a record would have given us a deeper insight into the depths of human nature than all his refined metaphysical analyses. If he ever belonged sincerely to the evangelical party, there must have been a tremendous revulsion of feeling in the change. If he belonged to the moderates, he had little to abandon beyond the doctrines of natural religion.

He married -- it is curious that the son never refers to the lady -- not long after his settlement in London, and when he had no resource but the precarious one of writing in periodicals. He must have had a hard struggle in these times, but he bore it resolutely. A writer in the "Edinburgh Review" (July, 1873) describes him. " In appearance he was strikingly like the portraits of Charles XII. of Sweden, with a lofty forehead, a keen and cutting face. His powers of conversation were extraordinary; but, both in his family and among his disciples, he was to the last degree tyrannical, arbitrary, and impatient of contradiction." "He was a harsh husband and a stern father." The first great literary work planned by him was the " History of British India," which he commenced and completed in about ten years, and published in 1817-18. In 1819 the Court of Directors of the India Company appointed him to the high post of assistant examiner of India correspondence, and he held this office till within four years of his death. He wrote articles in the " Encyclopaedia Britannica, " on government, education, jurisprudence, law of nations, liberty of the press, colonies, and prison discipline. He was also a contributor to the " Westminster Review," and the " London Review," which after a few months was merged in the " London and Westminster." In 1821-22 he published his " Elements of Political Economy; " in {373} 1829 his "Analysis of the Human Mind;" and in 1835 the " Fragment on Mackintosh," being the last work before his death, which took place 23d June, 1836.

For the last fifteen or twenty years of his life he was an important member of a thinking and writing circle, he himself being the centre of a smaller circle within that circle. In morals and politics he attached himself to Bentham, at that time obnoxious in the extreme to many, but adored by a select few. " Mr. Bentham, " says Mrs. Grote, " being a man of easy fortune, kept a good table, and took

pleasure in receiving guests at his board, though never more than one at a time. To this one guest he would talk fluently, yet not caring to listen in his turn." James Mill was often the one guest so highly favored. " Bentham lived in Queen's Square Place, Westminster, close to the residence of Mill and his family, and his house was lent to the historian of India." Acquainted with mental science (at that time not studied in London), through his training in Scottish philosophy, and his reading of Hartley, he became the leader in metaphysical thought in the metropolis. He had qualities which fitted him to influence young men. He was earnest; he was clear; he was strongly impressed with the evils of the past and present; he spoke authoritatively and dogmatically, and with contempt of those who opposed him, and facile minds bent before him. We have a friendly picture of him drawn by Mrs. Grote as he began to exercise a powerful influence over her husband. " Before many months the ascendancy of James Mill's powerful mind over his younger companion made itself apparent. George Grote began by admiring the wisdom, the acuteness, the depths of Mill's intellectual character. Presently he found himself enthralled in the circle of Mill's speculations; and, after a year or two of intimate commerce, there existed but little difference, in point of opinion, between master and pupil. Mr. Mill had the strongest convictions as to the superior advantages of democratic government over the monarchical or the aristocratic -- , and with these he mingled a scorn and hatred of the ruling classes which amounted to positive fanaticism. Coupled with this aversion to-- aristocratic influence (to which influence he invariably ascribed most of the defects and abuses prevalent in the administration of public affairs), Mr. Mill entertained a profound prejudice against the Established Church, {374} and, of course, a corresponding dislike to its ministers. These two vehement currents of antipathy came to be gradually shared by George Grote, in proportion as his veneration of Mr. Mill took deeper and deeper root. Although his own nature was of a gentle, charitable, humane quality, his fine intellect was worked upon by the inexorable teacher with so much persuasive power that George Grote found himself inoculated, as it were, with the conclusions of the former almost without a choice, since the subtle reasonings of Mr. Mill appeared to his logical mind to admit of no refutation. And thus it came to pass that, starting from acquired convictions, George Grote adopted the next phase; viz., the antipathies of his teacher,-- antipathies which colored his mind through the whole period of his ripe meridian age, and may be said to have inspired and directed many of the important actions of life. Originating in an earnest feeling for the public good, these currents gradually assumed the force and sanction of duties, prompting George Grote to a systematic course both of study, opinion, action, and self-denial, in which be was urgently encouraged by the master-spirit of James Mill, to that gentleman's latest breath in 1836. This able dogmatist exercised considerable influence over other young men of that day as well as over Grote. He was indeed a propagandist of a high order, equally master of the pen and of speech. Moreover, he possessed the faculty of kindling in his auditors the generous impulses towards the popular side both in politics and social theories; leading them at the same time to regard the cultivation of

individual affections and sympathies as destructive of lofty aims and indubitably hurtful to the mental character." Mr. Grote says in 1819: "I have met Mill often at his (Ricord's) house, and hope to derive great pleasure and instruction from his acquaintance, as he is a very profound-thinking man and seems well disposed to communicate, as well as clear and intelligible in his manner. His mind has indeed all that cynicism and asperity which belong to the Benthamian school; and what I chiefly dislike in him is the readiness and seeming preference with which he dwells on the faults and defects of others, even of the greatest of men. But it is so very rarely that a man of any depth comes across my path, that I shall almost assuredly cultivate his acquaintance a good deal farther." We have a less favorable picture in an article in the " Edinburgh Review" (July, 1873), {375} which says of the son His fine and loving temper was constantly struggling against the imperious dictates of his master, who had taught him to regard, as Mr. Grote tells us, the cultivation of individual affections and sympathies as destructive of lofty aims, and hurtful to the mental character. In the course of years several young men devoted to the study of metaphysics and mental philosophy were accustomed to meet twice a week at Mr. Grote's in the city, at half-past eight in the morning, for an hour or two. Jeremy Bentham was regarded by them as a kind of deity, whose utterances were closely watched and reverently received. James Mill was their prophet, who exercised uncontrolled sway over their minds." Mrs. Grote gives an account of the men and their studies. " They read Mr. Mill's last work, " The Analysis of the Phenomena of the Human Mind," Hartley" On Man," Dutrieux's "Logic," Whately's works, &c., discussing as they proceeded. Mr. John Stuart Mill, Mr. Charles Buller, Mr. Eyton Tooke, (son of Mr. Thomas Tooke), Mr. John Arthur Roebuck, Mr. G. H. Graham, Mr. Grant, and Mr. W. G. Prescott formed part of their class."

He now became a leader of opinion, and imparted his own character to a whole school. His intellect was clear, but not comprehensive; was strong, but one-sided. He saw what he wished to see, and did not go round the object to view the other side. Hence be was not troubled with uncertainties or doubts, and he laid down his opinions coolly and dogmatically, wondering how every man did not see as he did, and bearing no contradiction. The school of which he was a leader -- or, rather, I believe, <the> leader -- came to be called " Philosophical Radicalism," or sometimes the "Westminster Review" school, from that review being its organ. It was founded on Utilitarianism in morals and on sensational empiricism in philosophy; and Mill gave it its earnestness, its narrowness, its exclusiveness, and its fanaticism. The school had at first the general sentiment against them; but they persevered, and came in a few years to exercise a potent influence, which is felt at this day, in consequence mainly of the able men, then young, but now old or deceased, who became attached to it.

He has left us no account of the religious crisis through which he passed, but his son has told us the results which he {376} reached: "The turning point of his mind on the subject -- as reading Butler's `Analogy.' That work, of

which he always continued to speak with respect, kept him, as he said, for some considerable time a believer in the divine authority of Christianity, by proving to him that, whatever are the difficulties in believing that the Old and New Testaments proceed from, or record the acts of, a perfectly wise and good Being, the same and still greater difficulties stand in the way of the belief that a Being of such a character can have been the Maker of the universe. He considered Butler's argument as conclusive against the only opponents for whom it was intended. Those who admit an omnipotent as well as perfectly just and benevolent Maker and Ruler of such a world as this can say little against Christianity but what can, with at least equal force, be retorted against themselves. Finding, therefore, no halting place in deism, he remained in a state of perplexity, until, doubtless after many struggles, he yielded to the conviction that, concerning the origin of things, nothing whatever can be known. This is the only correct statement of his opinion; for dogmatic atheism he looked upon as absurd, as most of those whom the world has considered atheists have always done." " He found it impossible to believe that a world so full of evil was the work of an Author combining infinite power with perfect goodness and righteousness." He saw, what natural religion shuts its eyes to, that there were manifold evils in the world; so say the Scriptures, and tell us how they sprang up, and point to the remedy,-a remedy which Mr. Mill was not pre pared to adopt, and so was left without any relief from the dark prospect. We do not wonder in these circumstances that " he thought human life a poor thing at best, after the freshness of youth and of unsatisfied curiosity had gone by."

He was thoroughly discontented with the education commonly given to the young. "In psychology his fundamental doctrine was the formation of all human character by circumstances, through the universal principle of association, and the consequent unlimited possibility of improving the moral and intellectual condition of mankind by education." So he took the education of his oldest son into his own hand. At three he taught him Greek; and by the age of eight the boy had read " the whole of Herodotus, of Xenophon's' `Cyropaedia' and {377} `Memorials of Socrates,' some of the `Lives of the Philosophers' by Diogenes Laertius, part of `Isocrates ad Demonicum' and `Ad Nicoclem.'" At the age of nine he had read the first six Dialogues of Plato, from the "Euthyphron" to the "Theaetetus" inclusive. He was made to begin Latin in his eighth year; and from his eighth to his twelfth year he read the "Bucolics" of Virgil and the first six books of the "Aeneid," all Horace except the "Epodes," the "Fables" of Phaedrus, the first five books of Livy, with the remainder of the first decade, all Sallust, a considerable part of Ovid's " Metamorphoses," some plays of Terence, two or three books of Lucretius, several of the orations of Cicero and of his writings on oratory and his "Letters to Atticus;" and this while he was adding largely to his Greek and devouring elaborate volumes of history. At the age of twelve he entered on the study of logic, beginning with the " Analytics " of Aristotle. Everybody feels that it was a dangerous thing to lay such a load on the mind of one so young; and that there was an imminent risk either of his

brain being overworked or of his being turned into a pedant. The success of the trial proves that a boy of good ability may learn much more by systematic teaching than most people imagine. In the morning walks with the father the boy was induced to give an account of what he had read the day before.

There were surely great oversights in this training, as, for instance, in not allowing him to mingle with other boys, and in restraining natural emotions. " For passionate emotions of all sorts, and for every thing that has been said or written in exaltation of them, he expressed the greatest contempt. He regarded them as a form of madness. The intense was with him a byword of scornful disapprobation." In respect of religion the son says: " I am thus one of the very few examples of one who has not thrown off religious belief, but never had it: I grew up in a negative state with regard to it." The father " looked forward to a considerable increase of freedom in the relations between the sexes, though without pretending to define exactly what would be or ought to be the precise conditions of that freedom." A writer in the " Quarterly " (July, 1873) says: " He was full of what we should call the fanaticism of Malthusianism; to such a degree that he risked his own fairly earned reputation {378} with decent people, and involved in the like discreditable danger the youth of his son, by running a Malay muck against what he called the superstitions of the nursery with regard to sexual relations, and giving the impulse to a sort of shameless propaganda of prescriptions for artificially checking population. We should not even have alluded to this grave offence against decency, on the part of the elder and younger Mill, had it not been forced on our notice by recent events." The result was what might have been expected. We can understand how the son's natural feelings, so repressed, should have been ready to flow forth towards a lady who entered thoroughly into his peculiar views on all subjects, and that he did not seek to restrain these feelings, and had no compunctions of conscience, though that lady was married to another man. I believe we can see the result of the training in a younger son, represented as an engaging youth, who went to a warm climate for his health, and when there insisted on the physician telling him whether there was any hope of his recovery, and, on receiving an unfavorable reply, went and shot himself to avoid a lingering death.[96]

The work with which we have to do, is his " Analysis of the Human Mind." The title indicates the aim of the treatise. It is not an inductive observation of facts; it is not a classification of facts in a cautious and careful manner: it is a determined attempt to resolve the complex phenomena of the mind into as few elements as possible. Mental analysis, called by When the decomposition of facts, is undoubtedly a necessary agent in all investigation: but it should be kept as a subordinate instrument; and it requires to be preceded, accompanied, and verified throughout, by a microscopic and conscientious inspection of facts, with particular attention to residuary phenomena and apparent exceptions; if this is neglected the whole process may lead to most fallacious results. Thomas Brown had proceeded very much in the method of analysis, and

accomplished a great many feats in the way of decompounding the faculties enumerated by Reid and Stewart; and, encouraged by his success, Mill advances a great way further on the same route. Brown had stood up resolutely for the existence and validity of intuition, {379} maintaining in particular that we have an intuitive belief in cause and effect; had allotted a place, though an inadequate one, to judgment, under the name of "relative suggestion;" had poured forth a most eloquent exposition of the emotions, and defended the great truths of natural religion, including the existence of the deity and the immortality of the soul. Mill resolves all mental exercises into sensations and ideas, with laws of association connecting and combining them , and has left himself avowedly no religious belief whatever.

Dugald Stewart's teaching seems to have exercised little influence on his mind except to suggest the order in which he takes up his topics. I suspect he derived more from Hume than from Stewart. With Hume there is nothing in the mind but impressions and ideas; with Mill, only sensations and ideas; and both undermine our belief in the reality either of mind or body. He took advantage of all that has been done, in illustrating the influence Of association, by Hutcheson, Smith, Hume, Beattie, Alison, and Brown, and accounted by it for principles which these men reckoned original. He had also profoundly studied Hartley (" Observations on Man "), who had accounted for our complex mental feelings by sensations, ideas of sensations and association, connecting the whole with a theory of nerve vibrations, which Mill, following the Scottish school, abandoned.

Following the sensational school of France and Brown, he calls all the exercises of the mind " feelings." He begins with sensations, and goes over (Chap. I.) smell, hearing, sight, taste, touch, carefully separating from touch as Brown had done, and as Mr. Bain has since done, the feeling of resistance, extension, and figure, which he refers to muscular sensation; he also dwells fondly, as Mr. Bain has done, on the sensations of disorganization in the alimentary canal. He then treats of idea (Chap. II.); and now " we have two classes of feelings, one which exists when the object of sense is present, another that exists after the object of sense has ceased to be present. The one class of feelings I call sensations; the other class of feelings I call ideas." At this stage we wonder where or how he has got objects of sense with nothing but sensations and ideas. " As we say sensation, we might also say ideation: " " sensation would in that case be a general name for one part of our constitution, {380} ideation for another." It is clear that Mill's analysis has been the main book, or the only book on mental science, care fully studied by a certain class of London physiologists, -- such as Carpenter, Huxley, and Maudesley, -- who seldom rise above the contemplation of sensations and sensations reproduced. Verily it is an easy way of enunciating and unfolding all the varied processes of the mind to represent them as feelings, and put them under two heads, sensations and ideas; the ideas being copies of sensations, so that he is able to say: " There is nothing in the mind but sensations and copies of sensations." There is no room left for knowledge of objects or belief in objects,

internal and external, no judgment or reasoning, no perception of moral good and evil. It is a more inadequate resolution than that of Condillac, who called in a sort of alchemical power, and spoke of "transformed sensations." Mr. Grote writes to the younger Mill: " It has always rankled in my thoughts that so grand and powerful a mind as he should have left behind it such insufficient traces in the estimation of successors." I do not wonder that such a meagre exposition should not have carried with it the highest minds of the age, which turned more eagerly towards the German speculators, and towards Cole ridge, Cousin, and Hamilton. But his book has had its influence over the school to which he belonged, including Mr. Grote, and over certain physiologists, who, if they have only sensations and copies of sensations to account for, are tempted to imagine that they can explain them all by organic processes. His son, John Stuart, and Mr. Bain, have been greatly swayed by the elder Mill, but have clearly perceived the enormous defects of the analysis, which they have sought to rectify in the valuable edition of the work published in it; the fundamental defects however remain, and the corrections admit principles which these authors have not dared to avow or to carry out, as they involve so many other mental operations beyond sensations and ideas.

In Chap. III. he goes on to his favorite subject, association of ideas. Ideas have a synchronous and a successive order. When sensations have occurred synchronically, the ideas also spring up synchronically," and thus he fashions many of our complex ideas, as of a violin with a certain figure and tone. He resolves the ideas of successive associations into the one {381} law of contiguity. This resolution has been criticised by Hamilton (" Reid's Collected Works " Note D. . . . 2), and also by his son (Note to Chap. III.), who endeavor to show that the suggestion of similars cannot be thus accounted for, which they certainly cannot be unless we call in some intermediate processes. He shows how, by these associations, we get certain complex ideas, as the ideas of metals from the separate ideas of several sensations, -- color, hardness, extension, weight. In illustrating this point, he says, that " philosophy has ascertained that we draw nothing from the eye whatever but sensations of color." In opposition to this, Hamilton has demonstrated that, if we perceive color, we must also perceive the line that separates one color from another (Met. Lect. 27). The result he has reached is summed up: "We have seen first that we have sensations secondly, that we have ideas, the copies of these sensations thirdly, that those ideas are sometimes simple, the copies of one sensation; sometimes complex, the copies of several sensations so combined as to appear not several ideas but one idea and, fourthly, that we have trains of these ideas, or one succeeding another without end."

He turns to naming (Chap. IV.), and treats of the various parts of speech, but throws little light on them. He goes on to explain the various processes of the mind, beginning with consciousness (Chap. V.). " To say I feel a sensation, is merely to say I feel a feeling, which is an impropriety of speech; and to say I am conscious of a feeling is merely to say that I feel it. To have a feeling

is to be conscious, and to be conscious is to have a feeling." "In the very word 'feeling' all that is implied in the word 'consciousness' is involved." There is a palpable oversight here. When I feel a sensation it is of a sensitive organ as affected, and knowledge is involved in this. To be conscious is to know self as feeling or in some other state. " When I smell a rose, I am conscious." True, but I am conscious not of the rose, but of self as having the sensation. In explaining consciousness, he overlooks the very peculiarity of the thing to be explained.

He then (Chap. V., VI., VII., VIII., IX.) treats of conception, imagination, classification, abstraction. " Conception applies only to ideas and to ideas only in a state of combination. It is a general name, including the several classes of complex {382} ideas." But the question arises, What intellectual bond combines things generally? and we have no satisfactory answer. He thus misses one of the most important capacities of our mental nature. " An imagination is the name of a train but what combines so many scattered things into one image, often so grand? He has a long disquisition on classification. The word `man,' we shall say, is first applied to an individual it is first associated with the idea of that individual, and acquires the power of calling up the idea of him; it is next applied to another individual, and acquires the power of calling tip the idea of him, so of another and another, till it has become associated with an infinite number, and has acquired the power of calling up an indefinite number of these ideas indifferently." " It is association that forms the ideas of an indefinite number of individuals into one complex idea." Here again he has explained every thing by overlooking the <differentia> of the process, -- the resemblance between the individuals; the perception of the resemblances; the placing the resembling objects into a class of which so many predications may be made; and, as might be expected, he has no idea that there is such a thing as classes in nature. By taking a superficial view, he is able to throw ridicule on the theory of ideas by Plato, by Philo, by Cudworth, and Harris, in which there is no doubt much mysticism, but also much truth, which it should be the business of a correct analysis to bring out to view. The father thus set his son to what he is so fond of in his " Logic " and other works, -- the exposure of the error of looking on concepts as if they were individual existences. True, universals are not the same as singulars, yet they may have a reality which we should try to seize: some of them <ante rem>, in the Divine mind arranging classes in nature; in re, in the common attributes which join the objects in the class; and <post rem>, in the concepts formed by the mind, and performing most important functions in thought. Both Mr. Grote and Mr. John Stuart Mill in their notes have tried to improve Mill's doctrine of generification, but have left it, and their own doctrine as well, in a most unsatisfactory state. Abstract terms " are simply the concrete terms with the connotation dropped," whereon his son annotates. " This seems a very indirect and circuitous mode of making us understand what an abstract name signifies. Instead of aiming {383} directly at the mark, it goes round it. It tells us that one name signifies a part of what another name signifies, leaving us to infer that part." Neither father nor son has seen that

abstraction in all cases implies a high exercise of judgment or comparison, in which we perceive the relation of a part to a whole, a process which is the basis of so many other intellectual exercises.

He turns (Chap. X.) to memory, which has so puzzled the son, who says: "Our belief in the veracity of memory is evidently ultimate: no reason can be given for it which does not presuppose the belief and assume it to be well grounded." The subject presents no difficulties to the father. He acknowledges that in memory there is not only the idea of the thing remembered; there is also the idea of my having seen it: and he shows that this implies "the idea of my present self, the remembering self; and the idea of my past self, the remembered or witnessing self? " But where has he got self? Where a past self? He brings in, without attempting to explain them, <self>, and <time present>, and <past>, which are' not sensations nor copies of sensations. All that is done is " to run over a number of states of consciousness called up by the association." There is here, as in so many other cases, simply the shutting of the eye to the main element in memory, the recognition of an object as having been before the mind in time past: in which there is involved, first, belief, and, secondly, time in the concrete, from which the mind forms the idea of time in the abstract.

There follows (Chap. X -- I.) an elaborate discussion of belief, which both his son and Mr. Bain have been seeking to amend without success; because their own views, starting from those of the older Mill, are radically defective. In all belief, as it appears to me, there is a conviction of the reality of the object believed in. When the object is present, I would be disposed to call this knowledge; but, if any one calls it belief, the question between him and me would be simply a verbal one, provided he acknowledges the existence of a conviction. In other cases the conviction or belief is the result of judgment or reasoning. Let us now look at the account given by Mill. " A sensation is a feeling, but a sensation and a belief of it is the same thing. The observation applies equally to ideas. When I say I have {384} the idea of the sun, I express the same thing exactly as when I say that I believe I have it. The feeling is one: the names only are different." Here again the resolution is accomplished so dexterously, because the main elements of the thing resolved are not noticed. In a sensation I have not only a feeling, but a belief in the existence of a sentient organ. To have a belief in the existence of the sun is something more than merely to have an idea of the sun. The belief, be it intuitive, or be it derivative, is a different thing from the sensation and the idea, and should have a separate place in every system of psychology.

It is at this place that he develops most fully the principle for which he has received such praise from his son, -- the principle of inseparable association. " In every instance of belief, there is indissoluble association of the ideas," and he defies any one to show that there is any other ingredient. But, surely, there is often belief without any inseparable association: thus I may believe that a

friend is dead, though in time past all my associations have been of him as alive. But, even in cases of indissoluble association, the belief is different from the association. One of the grand defects of the whole theory consists in accounting by association of ideas for what is assuredly a different process, for judgment, for judgment proceeding on a knowledge of things. At no other point do we see so clearly the tendency of the whole school to degrade the dignity and undermine the trustworthiness of the human intellect.

By this indissoluble association he can account easily for our belief in causation. " I hear words in the street,-- <event>; some one of course is making them, -- <antecedent>. My house is broken and my goods are gone, -- event; a thief has taken them, -- <antecedent>. This is that remarkable case of association in which the association is inseparable." " We cannot think [in the sense of having an idea] of the one without thinking of the other." Once more the essential element is left out; we not only have an idea, we judge, decide, and believe; and when we judge, decide, and believe, that everywhere, at all times, and for ever, an event has and must have a cause, the process seems to me to be justifiable, but to involve an intuitive principle. Mr. John Stuart Mill is only following out the principles advocated by his father, when he holds that there may be worlds {385} in which two and two make five, and in which there may be an effect without a cause. In another subject James Mill has led his son to a point where the father has stopped, while the son has gone on. " In my belief, then, of the existence of an object, there is included the belief that, in such and such circumstances, I should have such and such sensations. Is there any thing more?" "I not only believe that I shall see St. Paul's church-yard, but I believe that I should see it if I were in St. Paul's church-yard this instant." This is on the very verge of the son's definition of body and of mind. We see how needful it is to examine the fundamental assumptions of a philosophy which has culminated in such results, and is undermining our belief in the reality of things.

In Chap. XII. we have a short and feeble account of ratiocination, in which he proceeds on the syllogistic analysis without comprehending the principles involved in it. He takes as his example, " All men are animals. Kings are men. Therefore kings are animals; " and he shows that in all this there is only association, and the belief which is part of it. In the proposition "kings are men," the belief is merely the recognition that the individuals named kings are part of the many of whom men is the common name. "Kings" is associated with "all men," " all men " with " animals; " " kings," therefore, with animals. The account of evidence, in the short chapter which succeeds, is merely a summation of what had gone before, and is exceedingly meagre.

He now turns (Chap. XIV.) to "names requiring particular explanations," and explains, according to his theory of sensations and ideas, such profound subjects as relations, numbers, time, motion, identity. Mr. Bain represents him as here "endeavoring to express the most fundamental fact of consciousness, the necessity of change

or transition from one state to another, in order to our being conscious. He approaches very near to, without exactly touching, the inference, that all consciousness, all sensation, all knowledge, must be of <doubles>," as if we could not have a sensation of pain till there is a change into pleasure, or of pleasure till we have also pain. This is to reverse the natural process in which we have first the individuals, and thus and then discover relations between them, -- it may be, many and varied, according to the knowledge we previously have of {386} the individuals. According to Mill, that a feeling of red and a feeling of blue is "different and known to be so, are not two things but one and the same thing;" thus doing away with all relation, in fact with all comparison and judgment, and reasoning as founded on comparison. "Space is a mere abstract term formed by dropping the connotation. Linear extension is the idea of a line, the connotation dropped; that is, the idea of resisting dropped." We ask what is the line? Infinite is the concrete term, here denoting line: drop the connotation, and you have infinity, the abstract." It is a convenient but certainly a most fallacious way of reducing realities to nonentities. Time is "pastness, presentness, and futureness" joined by association; but he can render no account of pastness, presentness, and futureness. The idea of motion and the idea of extension are the same. Identity is merely the name of a certain case of belief. " Reflection (Chap. XV.) is nothing; but consciousness is the having the sensations and ideas:" most people would say it is a knowledge of self, as having an idea, a sensation, or some other mental exercise.

He treats from Chap. XVI.-XXII. of the active powers of the mind, or the powers which excite to action. All throughout, he gains a delusive simplicity, simply by overlooking an element, commonly the main element, in the phenomenon. Desire is the same thing as the idea of a pleasure, " and the number of our desires is the same with that of our pleasurable sensations; the number of our aversions, the same with that of our painful sensations."I hold that desire is something superadded to mere sensation, and indicating a higher capacity, and that we may and ought to desire many things beside mere sensations of pleasure. He then proceeds to show us in the way the Scottish metaphysicians had done, from Hutcheson and Turnbull downwards; how the desire of pleasure gives rise to other impulses, which may by association become ends, and not mere means; such as, wealth, power, dignity, friendship, kindness, family, country, party, mankind. A man looks upon his child as a cause to him of future pains and pleasures, much more certain than any other person; " and thus gathers round it a whole host of associations that constitute parental love. All this I admit will mingle with and strengthen family affection; but in the heart of the affection there is a natural {387} love on the part of parents for their children. In accounting for the love of beauty, he takes advantage of Alison's theory, a theory not favored by those who have discovered mathematical relations in beautiful forms. The following quotation will en able us to understand what he means by motives: "As every pleasure is worth having, -- for otherwise it would not be a pleasure, -- the idea of every pleasure associated with that

of an action of ours as the cause is a motive; that is, leads to the action. But every motive does not produce the action. The reason is, the existence of other motives which prevent it. A man is tempted to commit adultery with the wife of his friend: the composition of the motive is obvious. He does not obey the motive. Why? He obeys other motives which are stronger. Though pleasures are associated with the immoral act, pains are associated with it also; the pains of the injured husband, the pains of the injured wife, the moral indignation of man kind, the future reproaches of his own mind. Some men obey the first rather than the second motive. The reason is obvious. In them the association of the act with the pleasure is, from habit, unduly strong: the association of the act with the pains is, from want of habit, unduly weak. This is a case of education." I believe that if men were trained to think that chastity has no other foundation than Mr. Mill has given it, the husband would be little attended to when he claimed to be injured, and the wife would cease to believe that she had injured any one, and the moral indignation of mankind would disappear; thus perilous would it be to remove morality from its foundation in moral principle, and place it on the shifting sand of association.

We are prepared for his analysis of the moral sense. "It is interesting here to observe by what a potent call we are summoned to virtue. Of all that we enjoy more is derived from those acts of other men on which we bestow the name I virtue,' than from any other cause. Our own virtue is the principal cause why other men reciprocate the acts of virtue towards us: with the idea of our own acts of virtue there are naturally associated the ideas of all the immense advantages we derive from the virtuous acts of our fellow-creatures. When this association is formed in due strength, which it is the main business of a good education to effect, the motive of virtue becomes paramount in the human breast." By all means let us try to collect {388} good associations round virtuous acts; but, as the centre and bond of the whole, let us have the principle that virtuous acts should be done because they are right. Discard this restraint, and attractive associations will be sure to gather round vice. He tells us (" Fragment on Mackintosh "), that his analysis of virtue into the love of pleasure and association does not lessen the influence of the motive. " Gratitude remains gratitude, resentment remains resentment, generosity, generosity in the mind of him who feels them, after analysis, the same as before." Yes in the mind of him " who feels them; " but the feeling may be undermined, and remorse for sin be quieted.

He closes the work with a discussion as to will and intention. Will is the peculiar state of mind or consciousness by which action is preceded. He treats of its influence over the actions of the body, and over the actions of the mind. He shows that sensations and ideas are the true antecedents of the bodily actions, and so he does not need to call in a separate capacity called the will. He then turns to the power which the mind seems to possess over its associations. He proves, as Brown and others had done, that we cannot will an absent idea before us, -- for to will it is already to have it; and the recalling is always a process

of association. He does not see that, by a stern act of will, we can detain a present thought, and thus gather around it a whole host of associations. He speaks of ends, but has no idea of the way in which ends spring up and influence the mind. He takes no notice of the essential freedom belonging to the will, and thus leaves no ground on which to rear the doctrine of human responsibility.

LII. -- JOHN BALLANTYNE.[97]

H/E\ was born at Piteddie, parish of Kinghorn, Fifeshire, May 8, 1778, and received his early education in the village school of Lochgelly. He matriculated in the university of Edinburgh in 1795, and seems there to have enjoyed the privilege of sitting under the instructions of Dugald Stewart. His parents belonged to the church of Scotland, but from conscientious motives, and from perceiving the want of religion in the students intending for the ministry in that body, he joined the burgher branch of the seceders, and attended their theological hall, where his metaphysical abilities were noticed by his professor Dr. Lawson. After being licensed to preach the gospel, he taught schools at Lochgelly, and at Colinsburgh. In 1805, he was settled as minister in the shire of Kincardine, at Stonehaven, a some what exposed place on the German ocean, but made interesting by bold rocks in the neighborhood, and a grand old ruined castle where the covenanters had been imprisoned. There he ministered to a small congregation of fifty members, and specially exerted himself in establishing sabbath schools, at that time very much unknown in the district. He lived a sly and retired life, cheerful in his own home, but not much known beyond, except by a few who noticed him taking his solitary walk daily along the links of Cowie, with tall and well-proportioned frame, and high capacious forehead, pondering, they supposed, some deep ecclesiastical or philosophic subject. In 1824, he published anonymously, "A Comparison of Established and Dissenting Churches by a Dissenter," and, in 1830, an enlarged edition of the same with his name prefixed. This work may be regarded as starting the voluntary controversy, which was carried on vigorously by the religious body to which he belonged, for years agitated Scotland from one end of it to the other, in the course of time spread into England, and, directly or indirectly, has been followed by far-reaching results, that have not yet exhausted themselves. There is reason to believe that he foresaw the consequences; he told his friend, Mr. Longmuir, that he expected to see him out of the established church and a dissenting minister like himself.

But he was also speculating on other topics. In 1828, he published An Examination of the Human Mind." It should be interesting to any one who has had to contend with adverse circumstances to contemplate this man in his quiet seceder manse on that bare coast, and among a people who appreciated his piety and devotedness, but had no comprehension of his philosophy, devoting himself so earnestly to the original study of the human mind. He could have been swayed by no inferior hope in the shape of an expected chair in one of the Scottish colleges; for these, while open to persons adhering really or nominally to established-church

Presbyterianism and Episcopacy were practically closed to a dissenting minister. This was doubtless one of the rankling causes that prompted the seceders to espouse the voluntary side so eagerly. They felt, in an age which was moving on towards the reform bill, that they had a title to complain of being consigned to an inferior position: it should be added that they felt that they had to abandon their strict covenanting principles, which were seen to be exclusive. Nor was this man or his book likely to get a favorable. hearing from the literary or metaphysical readers in Scotland, where the influential thinkers were James Mylne and Thomas Brown, to whose philosophy he was entirely opposed; and, as to England, it felt little interest in such inquiries. The work, though clearly written, has no such literary beauties as drew many towards the writings of Stewart and Brown, and it had some difficulty in getting into notice. There is no evidence that any of the professors {390} in the chairs of mental science took any interest in it, or were disposed to lift the author out of his obscurity. Nevertheless there were some in his own religious communion, and beyond it, who perceived the merit of the work, which is distinguished for its independence, and its rising above the philosophy of his time. " A gentleman," says Mr. Longmuir, " eminent both for his wealth and literary distinction, (the late Mr. Douglas of Cavers?) having seen the manuscript, and been informed of the limited means of the author, kindly offered to run the risk of its publication; but Mr. Ballantyne, having found that he had accumulated sufficient means to publish it himself, gratefully declined the generous offer. Some time after, a considerable sum of money was sent by the same gentleman, and placed entirely at Mr. Ballantyne's disposal. Instead of applying it, however, to the publication of his book, he paid it over for the benefit of the missionary operations that his presbytery was then promoting." A disparaging notice of his work appeared in "The Edinburgh Literary journal," a periodical long since consigned to oblivion, but he was not moved by it: he had done his work, and left it to speak for itself. Thus lived, and thus died, Nov. 5, 1830, one who was, above all things, resolute in maintaining his independence, both of action and thinking, -- independence not of God, but of man.

He finds it necessary to criticise Dr. Brown, and has anticipated some of the objections, afterwards propounded more formally by Hamilton. The system of Dr. Brown certainly discovers great ingenuity, and is expounded with great eloquence; but it appears to betray a want of that persevering diligence and scrupulous caution, without which metaphysical enquiries are in a great measure unavailing." He begins with a discussion of the sensitive principle." He distinguishes between sensations and ideas of sensation. "The sensations and ideas of extension, as far as can be ascertained, are suggested at the very same instant," where, it may be observed, that he uses the very objectionable word " suggest." Almost the whole of the body, whether external or internal, is sensitive and an impression on every sensitive part, whether occasioned by an external or internal influence, is accompanied with a sensation." " It is also accompanied, I imagine. with an idea of extension corresponding to the form and magnitude of the impression." " We always find that an impression on the organ of taste is

accompanied not only with a sensation, but with an idea of the part of the organ affected." " It is highly probable that the organ of smell also affords ideas of extension." " The sense of hearing seems to be governed by the same laws." Locke taught that we get our ideas of extension solely from sight and touch. Ballantyne maintains that we have them from all the senses, because by all the senses we have " an idea of the part of the organ affected," here anticipating favorite positions of Hamilton and the physiologist Muller.

He criticises the doctrine of Brown, that by the eye we discern only color, not in so climbing a manner as Hamilton, but in a like spirit. Some indeed contend that sight affords only sensations of color, and no idea of extension at all; but this opinion has never been established by adequate evidence and appears to be incompatible with not a few phenomena. At any rate, in the present state of our knowledge, we certainly have {391} by sight ideas of extension and ideas of greater or smaller portions of it, other things being equal, according to the impression on the organ, and are bound, therefore, to regard this as an ultimate principle, till it be traced to one more general. This, so far as I know, has never yet been done, and I am utterly unable to perceive how it can be done."

" We never but find that an impression on a sensitive organ is accompanied with an idea of duration, as well as with a sensation and an idea of extension." " Every impression, besides suggesting a sensation and an idea of extension, suggests in connection with them an idea of a portion of duration corresponding to the duration of the impression." And here he has again to criticise Brown, and by anticipation Mill. " There are no doubt many analogies between duration and extension; but to assume that they are literally one and the same thing, as Dr. Brown most evidently does, is one of the most unwarrantable assumptions that ever was hazarded." "That doctrine is, that duration and extension are substantially one and the same thing, and that a cubical foot, or a cubical yard, is not essentially different from an hour or a day." The sensations and ideas of extension " will give rise to the notion of length of duration as occurring in different points of duration, and of course as occurring in succession; but, unless length of duration be the same thing with length of extension, they can evidently give us no manner of notion of this latter species of length at all."

He has a very elaborate inquiry into the associative principle, "a branch of our constitution still involved in considerable obscurity." As I believe him to be right in affirming that at this point there are many unsettled questions, and as his observations are original and independent, I will quote from him at considerable length. He shows that ideas suggest each other, not according to relation among their objects, but among the ideas themselves. He dwells on what he calls the law of precedence. " One idea acquires power to suggest another by immediately preceding it," using the word "power" in the sense in which it is commonly used in physical inquiries. It follows, (1) "If one idea acquire power to suggest another by immediately preceding it, the greater the number of ideas

that it immediately precedes, the greater the number it will acquire the power of suggesting." (2) If one idea acquire power to suggest others by immediately preceding them, the more frequently it precedes, the greater power it must acquire to suggest them. He thus explains the circumstance that, when we meet with a person whom we have formerly seen only in one particular place, there is usually, to our recollection, a very distinct idea of that place; but when we meet with a person whom we have seen in a great many different places, there is seldom recalled an idea of any of them. (3) If an idea acquire power to suggest others by immediately preceding them, the greater the number of ideas that immediately precede any others, the greater will be their power when they recur to suggest these ideas. (4) If an idea acquire power to suggest another by immediately preceding it, the more vivid the idea that precedes any other, the greater will be its power when it recurs in a state equally vivid to suggest it.

He says that the law of contiguity in point of time is really three laws, -- {392} that "an idea will acquire power to suggest another by immediately preceding it, by existing at the same with it, and by immediately following it. The first of these laws is that of precedence, and into it he resolves all the others. Thus he resolves the law of coexistence into precedence. " Let A and B be two ideas which coexist for two sensible points of time, then A, while existing in the first point, precedes B while B is existing in the second; and B, while existing in the first point, precedes A while A is existing in the second point." Proceeding on the principle that the greater the number of ideas that coexist with any other, the greater the number afterwards suggested by i@ he explains how the longer an idea continues in the mind, the more readily will it afterwards recur; how the more frequently it has been in the mind, it will come up the more readily; how the longer it continues, it will be the more likely to recur; and how the more frequently it has been in the mind, it will be the more likely to continue. He resolves in the same way the law of contiguity in place, and the law of cause and effect; and affirms that the idea of cause has no power, independently of the law of precedence, to suggest the idea of an effect. He tries hard to explain in the same way the law of similarity. " Yesterday I saw a winged animal, to-day a winged animal of the same species." "When I yesterday saw the first animal, I obtained ideas of its peculiar qualities, and likewise of those common to it with all the individuals of the species to which it belonged. To-day, when I saw the other animal, I also obtained ideas of its peculiar properties, and of those common to it with all the species to which it belonged, that is, along with the ideas of the peculiar properties of the second animal, I obtained a number of ideas which coexisted with those of the peculiar properties of the first. According to the doctrine of coexistence, formerly explained, they would suggest ideas of the peculiar properties of the first. When they do so, I have ideas both of the common and of the peculiar properties of the first animal; in other words, I have an idea of the first animal itself, for that idea can be nothing but the aggregate of the ideas of its common and peculiar properties." He explains the law of contrast by showing

that, in every case where contrasted ideas suggest one another, it will be found that there is a considerable degree of similarity along with the contrast. He accounts by the same law of precedence for the secondary laws of Brown. Some of these resolutions seem to me over subtle, but they are worthy of consideration by those who would sound the depths of the subject.

He treats at length of the voluntary principle, and offers many judicious remarks. He criticises Stewart's doctrine of power, according to which " the author of nature has bestowed on matter no powers at all, of course never preserves its powers in being, nor even employs them in accomplishing his purposes, as there are no powers to be exercised. In the second volume (Part I 1.), he treats of moral law, of right, jurisprudence, and politics, somewhat after the manner of Stewart, with considerable sweep of style, but no great power of metaphysical analysis. {393}

LIII. -- THOMAS CHALMERS.[98]

H/ITHERTO\ there has been a severance, at times an opposition, if not avowed yet felt, between the Scottish philosophy and the Scottish theology. The one had magnified human nature, and tended to produce a legal, self-righteous spirit; whereas the other humbled man and exalted God, enjoining such graces as faith, humility, and penitence. But there never was any real opposition between the facts gathered by the one and the truths taken out of God's Word by the other. The metaphysicians had shown that there is such a faculty in man as the conscience; and the conscience proclaims that man is a sinner, while the Bible provides a forgiveness for the sinner in a way which honors the moral law. The reconciliation between the philosophy and the religion was effected by Thomas Chalmers, who has had greater influence in moulding the religious be lief and character of his countrymen than any one since the greatest Scotchman, John Knox.

He was born at Anstruther, in the "East Neuk" of Fife, and was the son of a reputable merchant there. In his boyish days he had to suffer not a little from a nurse and from a teacher who ruled by the rod; but he was " joyous, vigorous, and humorous." He manifested his natural character from an early age, being eager and impetuous in pursuing his favorite ends. He was not a very diligent pupil, but was a leader in fun and frolic. At the age of twelve he entered the University of St. Andrews, which about that time had such pupils as John (afterwards Sir John) Leslie, James Mylne, and John (afterwards Chief justice) Campbell. He is described as " enthusiastic and persevering in every thing he undertook, giving his whole mind to it, and often pursuing some favorite and even, as we thought, some foolish idea, whilst we were talking around him and perhaps laughing at his abstraction, or breaking in upon his cogitations and pronouncing him the next thing to mad;[99] and then he would good-naturedly join in the merriment with {394} his common affectionate expression 'very well, my good lads.'" It was in 1793 that he was awakened intellectually, and became excited with and absorbed in geometry, for which he had a strong taste and talent.

"St. Andrews," he tells us in after years, "was at this time overrun with moderatism, under the chilling influence of which we inhaled not a distaste only, but a positive contempt, for all that is properly and peculiarly gospel; insomuch that our confidence was nearly as entire in the sufficiency of natural theology as in the sufficiency of natural science." He has left it on record that he profited by the debating societies of the college. At this time he studied Godwin's "Political Justice," and was staggered by Mirabaud's "System of Nature." His friend, Professor Duncan, tells us that , he studied Edwards on Free Will with such ardor that he seemed to regard nothing else, could scarcely talk of any thing else, and one was almost afraid of his mind losing its balance." His favorite study, however, continued to be mathematics, towards which, as the science of quantity, he had a strong predilection, as shown in his propensity to count his steps as he walked. Still, even at this time, he had aspirations after something higher. One common expression in his college prayers was Oh! give us some steady object for our mind to rest on." I remember when a student of divinity, and long ere I could relish evangelical sentiment, I spent nearly a twelvemonth in a sort of mental Elysium, and the one idea which ministered to my soul all its rapture, was the magnificence of the godhead and the universal subordination of all things to the one great principle for which he evolved and was supporting creation. I should like to be impressed over again, but with such a view of the Deity as coalesced and was in harmony with the doctrine of the New Testament."

He was licensed to preach the gospel in 1799. His brother writes: " We are at some pains in adjusting his dress, manner, &c.; but he does not seem to pay any great regard to himself." Mathematical studies continue to engross his attention. He spent a winter in Edinburgh, studied under Robison, for whom he entertained a profound reverence, and Stewart, and devoted himself to chemistry and moral philosophy. Of Stewart he says: "I have obtained a much clearer idea than I ever had of {395} the distinctive character of Reid's philosophy. I think it tends to a useless multiplication of principles, and shrinks even from an appearance of simplicity." He was ordained minister at Kilmany, in his native county, in 1803. He still contrived to teach mathematics and chemistry in St. Andrews, -- a divided work from which be would have shrunk in later years, when he attained a higher idea of the importance of the ministerial office. In 1806, Napoleon Bonaparte issued his famous Berlin decree, shutting continental ports to British goods. Chalmers had all along a predilection for political economy: he was convinced that Great Britain had resources which made it in dependent of any other country, and in 1807 he published " An Inquiry into the Extent and Stability of National Resources."

We are now approaching the crisis of his life. In 1818 he was required to write an article for the " Edinburgh Encyclopedia," at that time under the editorship of Dr. Brewster, on the " Evidences of Christianity , " and he had to study the Christian religion and the proof which can be adduced in its favor more carefully and earnestly than he

had ever done before. Meanwhile there occurred a number of deaths among his relatives, and he was deeply affected. He now felt himself called on to strive after a pure and heavenly morality. March 17, 1810, -- I have this day completed my thirtieth year; and, upon a review of the last fifteen years of my life, I am obliged to ac knowledge that at least two-thirds of that time have been uselessly or idly spent, sometimes to while away an evening in parish gossip or engaging in a game at cards." A change has evidently come over him he did not yet open it fully, but he made allusions to it. I find that principle and reflection afford a feeble support against the visitations of melancholy." He was subjected to a period of confinement, and was led to read Wilberforce's " Practical View." " The conviction was now wrought in him that he had been attempting an impossibility; that he had been trying to compound elements which would not amalgamate; that it must be either on his own merits wholly or on Christ's merits wholly he must lean." He now betook himself in earnest to the study of the Bible. A visible change appeared in him. He became more diligent in the visitation of his parish, and his sermons had a power over his people such as they never had before. {306}

One so able, so earnest, must take an active part in the affairs of his country and of his age. He sets out with an excessive admiration of the parochial system of Scotland, not just as an end in itself, but as fitted to accomplish the ends which his great heart cherished. It seemed to him to provide every thing which the good and the elevation of a country required. It secured a school in every parish, and a minister to preach to and to visit every man and woman, and a body of assistant elders to watch over the morals of the community. It provided, too, for the wants of the poor by a voluntary relief which did not interfere with their spirit of independence. The whole system bulked in magnificent proportions before his splendid imagination. No doubt he saw that the church was not realizing this pattern: he knew that there were ministers around him who were not fulfilling these high ends. But then the church, by the exercise of the high prerogatives given it by Christ, could restrain the evils of patronage, and carry out thoroughly the original design of the Church of Scotland. He did not foresee the difficulties he would have to meet in carrying out his grand ideal,-difficulties arising from the State, which did not wish too zealous and too powerful a Church, and on the part of the people, who were jealous of too strong an ecclesiastical organization.

He was called to Glasgow in 1815, and there labored with all his might to put his idea in execution, first in the Tron Church and then in St. John's Church, -- built expressly for him. He preached as no man in Glasgow had ever preached before. He visited from house to house, and thus became aware of, and hastened to proclaim to all men, the awfully degraded condition to which Glasgow, and, as was soon discovered by others, to which all the great cities in Scotland and England had been reduced. The world, as well it might, was startled and awed by the scene disclosed. The philosophers had made no inquiry into the subject, and had no remedy for the evil. The refined city ministers were satisfied with preaching well-composed sermons, moral or

evangelical, to the better classes. The dissenters ministered zealously to their own select congregations, but were not able for the Herculean task of cleansing the impurity which had been accumulating for ages. But the evils must be remedied. So he set about erecting chapels, and {397} called on the paternal government to endow them. But he met with opposition from statesmen not willing to tax the community for the benefit of one sect, and from dissenters who believed that their own method of spreading the gospel was the better. The voluntary question was started, and he threw himself into the fight, and defended religious establishments on the ground that man, being carnal, would not seek for spiritual things, which could not, therefore, be left to the ordinary political principle of demand and supply, -- thereby, as some of us think, overlooking the power in the living converted members of the church, who are more likely than the State to supply what is wanted to the careless and the outcast. He certainly did not estimate, as he ought to have done, the enmity of the world toward the church,-an enmity which met him at every point. But he persevered manfully, never losing sight of his grand aim. His course may seem an inconsistent one to a superficial observer; but there was a unity given to it by the end which he pursued as steadfastly as the sun moves in the heavens above the winds and clouds of the earth. He must have the glorious gospel of Jesus Christ preached to every creature, and he supported the Established Church as fitted to accomplish this end, at the same time holding resolutely by the spiritual independence of the church as given it by Christ, and as necessary to enable it to fulfil its grand ends. And when he found that the church he so loved was interfered with in carrying out its designs, he went on bravely to the disruption of 1843, and amidst convulsions led on an exodus towards a land which he saw before him, but into which he could scarcely be said to enter. Ere he departed in 1847, he had by his wisdom established a sustentation fund for the benefit of the ministers of religion, which he hoped would secure the stability and other benefits of an established church without its temptations. He lived to see churches multiplied by means of the secession far beyond his most sanguine expectations; but he did not live to see such a union among churches as is fitted to secure the grind end which he kept ever before him, -- the spread of the gospel in all the destitute and depraved districts of the land.

I regard Chalmers as the greatest preacher which Scotland has produced. Those who have heard him can never forget {398} the impression he produced. As he spoke, he stood firm upon his legs, and looked with a broad, honest face on his audience. At first there was a flabbiness, a sort of cheesiness, about his look and a blankness in his expression; but he uttered a clear, broad, emphatic sentence, and gained the attention of his hearers; and as he advanced he was evidently interested him self and thoroughly interested the congregation; and soon he became absorbed as did all who listened to him; and in the end there was mind and heart manifested in every member and in every action (often uncouth) of his body, and the people were carried along to the close by a torrent which they could not resist, and to which they enthusiastically yielded. His

pronunciation was Scotch, -- provincially Scotch. His style was not pure, not classical, was scarcely English; but it was his own, as is Thomas Carlyle's. It was clear, manly, broad, and massive. But when he spoke no one ever thought of his manner or language: everybody was so carried along by his earnestness and his matter. He commonly began by a clear enunciation of some philosophic or moral principle of great practical moment, and then proceeded to unfold and illustrate it. He did not turn aside himself and he did not distract his hearers by the introduction of a variety of topics; he keeps to his one principle, but he presents it under a vast variety of aspects, all contributing towards the one impression. He is marching up a hill, and he takes us with him; he often lingers by the way and gives us glorious retrospects of the ground we have traversed and glorious prospects of the heights to which he is to conduct us, and he carries us at last to a lofty height with a magnificent scene spread all around. The result is that he has gained our convictions: he has done more, we are ready, by the impulse he has given, to execute what he proposes. At the close, as we feel that he has forgot himself, so we forget our selves, and forget him as a speaker in an admiration of the truth he has expounded or an eager desire to perform what he has inculcated. What he has said has become incorporated with us, like food to strengthen us and go with us. He has planted a principle in the heads and hearts of his hearers to continue there for ever, to send out roots downward and stems and branches upward. The consequence was, that, if be was not the most intellectual or emotional speaker of his age, {399} he was the most practically influential, spreading his power over the length and breadth of Scotland.

Even in the most active operations, and the keenest controversies thereby excited, he retained his academic and philosophic tastes. He delivered in 1815-16 his " Astronomical Discourses," which drew on week-days the busiest Glasgow merchants from their offices and warerooms. In these discourses he obviates the prepossession apt to be created and fostered in intelligent and refined minds by the Scripture doctrine of the Son of God dying for man, and he does so by showing how great care God takes of the most minute objects and events. In most of his sermons he proceeds upon and unfolds some important philosophic principle. In his "Mercantile Discourses" he lays down the moral principles of business transactions, and shows how a rigid attention to them would restrain injurious speculation and promote a healthy trade. In those on " Human Depravity," he proves that there may be the deepest sinfulness in hearts which yet have many amiabilities. In his " Commentary on the Epistle to the Romans," he is not always able to enter into the thoughts of the apostle, or follow him in his subtle transitions; but he powerfully defends the grand doctrines of revelation by showing that they are sustained by a profound philosophy. His doctrine, drawn from Scripture, is substantially that of the old Scotch divines from Knox downwards: but every one feels that it is pervaded by a new and fresh spirit; it has less of a stern aspect; it is tolerant; it is catholic. The stream has descended from the stern rocks of the sixteenth, and is sweeping along amid the fertility of the nineteenth, century.

I never met any man who had so large a veneration for all that is great and good. It was primarily a veneration of God, and derivatively for all excellence. He had a profound reverence for royalty, for greatness, for rank and station; was essentially a conservatist in politics; and felt very keenly when by his unflinching adherence to principle he seemed to be separating the upper classes from the Church of Scotland. Without being a hero-worshipper, for he worshipped God only, he had a great admiration of intellectual greatness, at least when it was associated with humility. He never wearied to dilate on the greatness of Sir Isaac Newton, and often introduced him some {400} what inappropriately. Jonathan Edwards he admired for his profound metaphysical ability and his consuming piety; and he employed the arguments of that great man on behalf of philosophical necessity to support, what is a different thing the Scripture doctrine of predestination. But the author from whom he derived most, and who again was indebted to him for eloquent expositions of his philosophy, was Bishop Butler. He was vastly impressed with his enlarged views and with his cautious, practical wisdom; and learned from him the habit of connecting nature and revelation.

With such tastes and aims we can conceive that he would look with a favorable predilection towards the occupation of an academic position. So in 1823 he accepted the call to become professor of moral philosophy in the University of St. Andrews. Here he exercised a very great influence in attracting students, in exciting a prodigious enthusiasm among them, and in setting them forth with high purposes to noble works. He gained the position of highest influence when he was appointed in 1827 to the chair of theology in the University of Edinburgh. I am not sure that Scotland has ever had a higher instructor than Chalmers, in respect of all the qualities that go to constitute a successful teacher. He was always well prepared: he was as orderly as a mathematician could be; even his very prayers were often written out. He was a very methodical examiner on his text-books and his lectures, having his very questions ready, but departing from his prepared queries when circumstances required. As a lecturer he did more than delight his audience: he entranced them. They gazed upon him; and at times had difficulty in taking notes, they were so moved and elevated. He did not carry on his students very rapidly or over much ground; but he made them thorough masters of the subject, and imparted an impulse which led them to enter fields of their own. He was particularly interesting and successful when he was expatiating in the border country which lies between theology and philosophy. His course of moral philosophy in St. Andrews, and that on natural theology in Edinburgh, were particularly relished by all students capable of appreciating high truth. He expatiated with great delight on the analogies between natural and revealed religion. His special lectures on the ,Evidences of Christianity" were not so eminently {401} successful, though they were very valuable. In his early and immature work on the " Evidences," he was particularly anxious to make the whole proof inductive, and missed some of those great principles of our moral nature, which, how ever, he afterwards expanded so fully and so effectively in the work

as it took its later forms. The student feels that he is deficient in scholarship, and that he gives us metaphysics when he should have presented us with history. In his theology proper, it is evident that he is not specially an exegete. No one would reckon him a high authority in the exposition of a passage of Scripture. But he presents the great truths of the Bible in noble and attractive forms. His creed is essentially Calvinistic; that is, he holds by the same views as Calvin drew out of the Scriptures; but they appear with a more humane and benignant aspect, and with a more thorough conformity to the principles of man's nature.

In his philosophical works he unfolds and enforces a number of very important principles, not, it may be, absolutely original, but still fresh and independent in his statement and illustration of them, and setting aside error on the one side or other. His " Sketches of Moral and Mental Philosophy " cannot be said to be a full work on ethics, but it enforces great truths in a very impressive and eloquent way. He draws the distinction between mental and moral philosophy: the one has to do with <quid est>, and the other with <quid oportet>. He holds by the distinction between will and desire, maintaining that the former may be moral or immoral, whereas the latter is not. It seems to me that he has scarcely hit on the essential ethical distinction, which is not between will and desire, but between emotion and will; the latter of which may embrace not only volition, but wishes; in short, every thing optative, every thing in which is choice. He treats of the emotions, and shows that there is always a conception (the better expression is phantasm) involved in them. He dwells on the command which the will has over the emotions and of the morality of the emotions. Nothing is either virtuous or vicious unless the voluntary in some way intermingles with it; but then the will has influence over a vast number of the operations of the mind. " It may be very true that the will has as little to do with that pathological law by which the sight of distress awakens in my {402} bosom an emotion of pity, as with that other pathological law by which the sight of a red object impresses on my retina the sensation peculiar to that color; yet the will, though not the proximate, may have been the remote, and so the real cause both of the emotion and sensation notwithstanding. It may have been at the bidding of my will that, instead of hiding my self from my own flesh, I visited a scene of wretchedness, and entered within the confines, as it were, of the pathological influence, in virtue of which, after that the spectacle of suffering was seen, the compassion was unavoidable." He has very just remarks, propounded with great eloquence, on the final cause of the emotions.

His views on natural theology appeared first in the "Bridge water Treatise," on" The Adaptation of External Nature to the Moral and Intellectual Constitution of Man." The feeling of admiration excited was mingled with disappointment. The bulk was too great for the matter, and the work had the appearance of a hasty recooking of his old thoughts which were grand in themselves, but were not formed into a duly proportioned whole. His arguments and his illustrations have a much better form given them in his subsequently published work, "Natural Theology." He begins

with a discussion of the <a priori> argument for the existence of God, and examines Samuel Clarke's " Demonstration." He objects that Clarke would make the test of a logical and mathematical truth to be also the test of a physical necessity in the existent state of actual nature, and that he confounds a logical with a physical impossibility. He turns to the <a posteriori> argument, but is obliged, without his being aware of it, to call in an <a priori> principle. "The doctrine of innate ideas in the mind is totally different from the doctrine of innate tendencies in the mind, which tendencies may be undeveloped till the excitement of some occasion have manifested or brought them forth." He proceeds, as every one must, in constructing the argument from design, on the principle of cause and effect, but identifies that principle with what is surely a different thing, -- with the expectation of a uniformity in the succession of events. At this point he draws the distinction, which has been accepted by J. S. Mill, and has ever since been identified with Chalmers's name, between the laws of matter and the collocations of matter. It is from the {403} collocations of matter rather than the laws of matter that he draws his argument for the divine existence. The distinction seems to be deep in the constitution of things, but might be better represented, perhaps, as the distinction between the properties of matter and the dispositions of matter, these dispositions manifesting design, and consequently intelligence.

He is most successful when he is arguing from the constitution of the human mind. He dwells with great fondness and force on the supremacy of conscience and the inherent pleasure of virtuous and the misery of vicious affections, and gives a powerful exposition of the law of habit. He has a clear, masterly, and eloquent exposition of Leibnitz's theory of the origin of evil, not positively adopting it, but using it as an hypothesis to obviate objections. Here and elsewhere he unfolds a very favorite principle, that hypotheses may be advanced in theology to answer objections even when they do not establish positive truth. The logical meaning of this principle is that the hypothesis sets aside the unlimited major premise necessary to establish the infidel objection. He seeks to answer the objection to prayer drawn from the uniformity and fixed character of the laws of nature by showing that we can trace the agencies of nature only a little way back, and that interferences may take place in that outer region which lies beyond the ken of man. It may be replied that, by just inference, we can trace the agencies far beyond the immediate inspection of man, and that we find them everywhere uniform. It might be wiser in these circumstances to trace up both the prayer and its answer to the pre-established harmony of things appointed by God. He closes his work by showing that natural theology is as useful in exhibiting man's needs, and thus preparing him to receive the remedial complement supplied by the Bible, as even in the positive truths which it has established.

We have seen in the cases of Stewart, Brown, and Mackintosh what difficulties those trained in the Scottish metaphysics had in comprehending the German philosophy and accepting the truth. Hamilton, we shall find, labored to

combine the two. Chalmers, meanwhile, was engrossed with philanthropic work; he did not understand the German language, and it was not till the last year of his life, when he got a little lull in 1847 after the disruption storm, that he became acquainted with the {404} German philosophy, to which he was introduced by Mr. J. D. Morell's well-written and interesting work, " An Historical and Critical View of the Speculative Philosophy of Europe in the Nineteenth Century." He entered on the study with a youthful enthusiasm, and reviewed the work in the " North British Review." " It is long since an), work has made its appearance before a public in a state of greater expectancy and readiness for its lessons." With a mind of similar openness and candor, he is ready to receive whatever truth Kant and the Germans may offer. He confesses his gratification on finding, "amid all these conflicting systems and speculations, that our theology is safe." He rejoices to find profound points of agreement between Reid and Kant, and is willing to take the truth in either form. " Now, for comparing the Scottish and German philosophies, whether as it respects their similarities or their differences, it is of importance to mark how these primary beliefs of Dr. Reid are at one with the primitive arguments of Kant, or with his forms of the understanding. They may have been the better named by the latter of these two philosophers he may have probed more deeply into their foundations, or, rather, perhaps, into their method of development; he may have constructed a fuller and more accurate list of them, and, without pronouncing on his scheme for their application, or by which he would bring his categories to bear on the objects of the external world, it might be fully conceded that, altogether, be has enlarged and in some respects amended the philosophy of Dr. Reid. Yet let us not, because of the altered nomenclature, or of the new garb that has been thrown over them, overlook the substantial identity, and that, in respect of almost all, between the principles of the Scottish school and those from which Kant has earned his chief reputation." It is clear that he was not sufficiently far advanced in his knowledge of Kant and of the German philosophy to discover that there was a subtle scepticism in the philosophy which made the forms of the reason merely subjective; whereas Reid gave them an objective validity, an external validity when they related to external objects.

With great shrewdness he seizes on an incipient error, which has since grown into a formidable error. "We demur to the proposed substitution of Mr. Morell for Dr. Reid's account {405} of perception, that it is altogether an act of the mind. He affirms that the very essence of perception consists in the felt relation between mind and matter. And what we affirm is, that matter might be perceived, and, with the strongest sense and conviction in the mind of its reality, when the mind itself is altogether out of the reckoning." " It is not more necessary to be conscious of the mind in the business of perceiving than to be conscious of the eye in the business of seeing." " We can perceive without thinking of the mind, as we can perceive without thinking of the eye; and he complains of the " undue mixing up of the subjective with the objective, in which chiefly it is that the erratic movements of the German philosophy have

taken rise." He here opposes at the entrance that doctrine of relativity which was developed by Hamilton, and has been applied by Herbert Spencer.

He also makes good use of the distinction, as drawn by M. Cousin, between the spontaneous and the reflex exercises of the human understanding. "We have long been in the habit of recognizing these under the title of the mind's direct and reflex processes, and we shall continue so to name them." Though it be only by looking inwardly or looking back upon ourselves that we take cognizance of our various beliefs, these beliefs must be formed so as to exist ere they can be recognized or reflected on." So he blames Mr. Morell for constantly " mixing up consciousness and the facts of consciousness," and M. Cousin for finding the ground of our belief in an external world in a subjective act. "He looks for it, and imagines that he has got his first hold of it among the reflections of the psychological tablet within, whereas, if it is to be had at all, spontaneous as it is, it will be the primary act of looking direct on that radiance that cometh from the object of contemplation without." In following this train of thought he comes near to, and yet does not reach, a distinction on which I set great value, -- the distinction between our primitive apperceptions or intuitions as they spontaneously act and as they are generalized into maxims, axioms, or fundamental truths by the metaphysician. Considered under the first aspect, they act whether we observe them or no, and act best when, like the physiological processes of breathing, they are not noticed, and they cannot in any circumstances be supposed to err; whereas under the other {406} aspect they are the result of a discursive process of abstraction and generalization, in which there may be much error, by our adding to, or taking from, or mutilating the spontaneous process in the reflex account given of it by those who would put what is concrete and individual into a universal form.

This was one of the last compositions of Thomas Chalmers, who was found dead in his bed on the morning of May 31, 1847. His soul was transparently ready for the new truth to be disclosed to him in heaven, where what he saw as through a glass darkly on earth, appeared to him face to face.

LIV.-- JOHN ABERCROMBIE.

C/AN\ mental science be made popular and practical? It is certainly desirable that it should become so. It is of moment that the great body of educated men and women, in knowing something of history and physics, should also be acquainted with the laws of their own mind, and this though they have no predilection for the abstruse discussions of metaphysics. We have admirable compends of physical science made comprehensible to the common understanding' If we are to preserve the intelligent mind of the country from falling under the influence of the advancing materialism, we should have like expositions of mental and moral investigation for the use of upper schools, male and female, and the reading population who have not the advantage of a collegiate

education. We have such works in Abercrombie's " Intellectual Powers " (1830),and his " Philosophy of the Moral Feelings" (1833). He proceeds throughout on the method of Reid, and his treatises summarize some of the best results of the philosophy of Scotland. They are also valuable for the admirably reported cases illustrative of the influence of mind on body and body on mind. Nor is it to be omitted that there runs through all his works a vein of evangelical piety, decisive and outspoken without being offensive.

He was the son of a minister of the Church of Scotland, and was born at Aberdeen in 1780. He studied medicine in the University of Edinburgh, and became, after the death of Dr. Gregory, the most eminent Scotch physician of his time, being distinguished for his great skill and judgment. He wrote a number of medical works, treating of the brain, spinal cord, and of disease. He died in 1844.

In his "Intellectual Powers," he begins with stating what be regards as the object of science: it is to observe facts and trace their relations. He here treats of cause and effect, which he confounds with the uniformity of nature. He makes our belief in it an original instinct, but awkwardly brings observation and inference as involved in it. He distinguishes, in the manner of Reid and Stewart, between physical and efficient cause, regarding {407} the former as the only object of philosophic inquiry. He opposes materialism, but not very effectively. He then treats of the faculties of the mind arranging them: sensation and perception, consciousness and reflection, memory, abstraction, imagination, reason or judgment. Under the last he treats of first truths. But by far the most interesting and useful parts of his works are those in which he treats of the practical application of metaphysical subjects, as, for instance, of the laws of investigation, of fallacies, attention. He is in his own field when he is illustrating dreaming, somnambulism spectral illusions, and insanity. He makes a most useful application of the whole to the study of medicine. His statement of cases may always be depended on for its accuracy. I may give a few examples. He says of Dr. Leyden that he could repeat correctly a long act of parliament, or any similar document, after having once read it. When he was on one occasion congratulated by a friend on his remarkable power in this respect, he replied that instead of an advantage, it was often a source of great inconvenience. This he explained by saying that when he wished to recollect a particular point in any thing which he had read, he could do it only by repeating to himself the whole from the commencement till be reached the point which be wished to recall. Again, "a distinguished theatrical performer, in consequence of the sudden illness of another actor, had occasion to prepare himself in a few hours' notice for a part which was entirely new to him, and the part was long and rather difficult. He acquired it in a very short time, and went through it with perfect accuracy, but immediately after the performance forgot it to such a degree that, though he performed the character for several days in succession, he was obliged every day to study it anew. Characters which he had acquired in a more deliberate manner he never forgets, but can perform them at any time without a

moment's preparation. When questioned respecting the mental process which he employed the first time he performed this part, he says that he lost sight entirely of the audience, and seemed to have nothing before him but the pages of the book from which he had learned, and that if any thing had occurred to stop this illusion, he should have stopped instantly." I may give another instance. "A lady, in the last stage of chronic disease, was carried from London to a lodging in the country; there her infant daughter was taken to visit her, and, after a short inter view, carried back to town. The lady died a few days after, and the daughter grew up without any recollection of her till she was of mature age. At this time she happened to be taken into the room in which her mother died without knowing it to have been so. She started on entering it, and, when a friend who was along with her asked the cause of her agitation, replied -- "I have a distinct impression of having been in this room before, and that a lady who lay in that room, and seemed very ill, leaned over me and wept."'

The work on the " Moral Feelings " does not seem to me so valuable, and this because he cannot in treating of such a subject, have so many of those cases which he as a medical man had so carefully noted. But it is characterized by a fine spirit, and it has a useful tendency. He has some important remarks on the " Analogy between first Truths or Intuitive Principles {408} of Belief in Intellectual and Moral Science." "In applying to these important articles of belief the name of first truths or primary principles of moral conviction, I do not mean to ascribe to them any thing of the nature of innate ideas. I mean only that they come with a rapid or instantaneous conviction, entirely distinct from what we call a process of reasoning in every well-regulated mind, when it is directed by the most simple course of reflection to the phenomena of nature without and to the moral feelings of which it is conscious within." In his analysis of man as a moral being, he includes: (1) The desires, the affections, and self-love; (2) The will; (3) Moral principle or conscience; (4) The moral relation of man towards the Deity. The discussion of these subjects is not very deep or original, but it is commonly correct and always useful.

LV. -- DAVID WELSH. [100]

A/T\ the time we have now reached there was a strong reaction against moderatism and rationalism, and a tendency to return to the simple faith of the Bible; and a reconciliation of Scotch philosophy and evangelism was openly proclaimed. Ministers from the pulpit, and theologians in the divinity halls, were employing the principles of the mind and of morality to support the peculiar truths of Christianity. If there be a moral law, it points to a law-giver. If that law be immutable and unbending it shows that man is a sinner; it points to the need of an atonement, and requires such evangelical graces as humility, faith, and repentance. We have a fine exemplification of this union of philosophy and evangelism in Dr. David Welsh. He belonged to a " God-fearing " family residing in that somewhat bare but romantic sheep country in which the rivers Clyde, Tweed, and Annan rise. He was born

Dec. 11, 1793, was educated first by a private tutor, next at the parish school of Moffat, then at the high school of Edinburgh, and thence went to the university. There he fell, in 1808-9, under the attractive influence of Dr. Brown, " who admitted him to much and intimate intercourse, directed him in his private studies, discussed with him the subjects of his reading, and aided in cultivating his taste for polite literature." When in the university he devoted himself carefully to composition, and afterwards recommended the habit to his pupils. "I cannot conceive it possible for a young man to think very closely or profoundly upon any subject if he does not commit his thought,; to paper. A confused idea, a kind of half comprehension, a partial glimpse of any subject, will satisfy every person -- I mean every young person -- who has not to make an immediate use of his information upon that subject. But if you have to write upon the subject, an indefinite conception will not suffice: the cur rent of your thoughts is arrested; you are compelled calmly and deliberately to revolve and to consider, and the consequence necessarily must be that you arrive at clear and comprehensive views." {409}

He was licensed to preach in 1816, but in these days of patronage did not get a church till 1821, when lie was settled in Crossmichael, a peaceful country parish among the hills of Galloway. There he was a much beloved and respected pastor for six years, and there he wrote his life of Dr. Brown. In 1827 he became minister of St. David's, Glasgow, and was soon very influential as a preacher. " His delivery wanted some of those outward graces which often gloss over defect in matter. He was far from fluent; and indeed lie preached apparently with effort. In consequence of the weakness of his chest, there was often a straining in the getting out his words, which was at times painful to the listener; though it added to, rather than detracted from, the earnestness with which his discourses were delivered." He gathered a large congregation of thoughtful people, including not a few students of Glasgow University, who were delighted with his clear, chaste language, his fine reflection, and his warm piety. He was a noble example of a philosopher, teaching, not philosophy, but the doctrines of the cross, always in a philosophic manner and spirit. In 1831 he was elected professor of church history in the university of Edinburgh, where he was a conscientious, careful teacher, and a discerner and patron of young men of promise. He did not take a very prominent part in church politics, but was a consistent opponent of church patronage, and a firm supporter of popular rights and the spiritual independence of the church. He was moderator of the general assembly of the Church of Scotland in 1842, which passed a solemn " claim, declaration, and protest against the encroachment of the civil courts." In 1843 he had to preach at the opening of the assembly, and took as his text, " Let every one be fully persuaded in his own mind; " and delivered a sermon, through which there runs a vein of fine philosophy. After reading the protest he headed the imposing procession of ministers, who marched through the streets of Edinburgh to the Canon Mills Hall. In the Free Church of Scotland he especially interested himself in the cause of education. He died April 24, 1845.

In his life of Brown we have a very interesting account of the man, and an able abstract of his philosophy. He gives a full and fair statement of the favorite tenets of Brown, and defends them from objections which have been taken to them. He dwells with fondness on the additions which Brown is regarded as making to philosophy by his theory of causation, by his analysis of the faculties, by his account of suggestion simple and relative, and specially of generalization. As might be expected of one who had felt the fascination and enjoyed the eloquence of his master, be over-estimates his merits. " In the philosophic love of truth, and in the patient investigation of it, Dr. Brown may be pronounced as at least equal, and in subtlety of intellect and powers of analysis as superior, to any metaphysician that ever existed. Or if there ever was any philosopher who might dispute with him the palm for any one of these qualities, of this at least I am certain, -- that no one ever combined them all in equal perfection."

It was hoped by many that Dr. Welsh would write a philosophic work of his own. But he became " fully convinced of the substantial truth of the doctrines originally published by Dr. Gall." He is careful to explain: " The cerebral organs are not the mind, nor is any state of these organs the mind. {410} The mind we believe to be a simple and indivisible substance." In a sketchy article in an early number of the " North British Review," of which he was editor at the time, he showed that he was able to grapple with the deeper problems of the day. We see in all his sermons and papers an underlying philosophy gendered by the study of the Scottish school. But his energy was directed to preaching, to lecturing on church history, and to philanthropic objects.

LVI. -- JOHN WILSON.[101]

A/T\ the end of last century, Paisley had a considerable body of high-class citizens who made money and benefited their town by turning cotton into gauze and other useful products. John Wilson was the son of one of these, and was born in 1785 in by no means a poetical spot in a dingy court at the head of the High Street. We can believe that the boy was " as beautiful and animated a creature as ever played in the sunshine." He received his education first in his native town, and then at the manse of Mearns, -- a bare, wild upland district fitted to call forth a sense of freedom, but with nothing grand or romantic in its scenery. On the death of his father he entered as a student in Glasgow University, and continued there till 1803. In future years he acknowledged in "Blackwood" his obligations to Jardine as "a person who, by the singular felicity of his tact in watching youthful minds, had done more good to a whole host of individuals, and gifted individuals too, than their utmost gratitude could ultimately repay. They spoke of him as a kind, intellectual father, to whom they were proud of acknowledging the eternal obligations of their intellectual being." He indulged freely in dinners, balls, and parties; but Glasgow College made its students work, and Wilson was an ardent student He began to keep a diary, and we have an entry: " Prize for the best specimens of the

Socratic mode of reasoning given out in the logic." " Got the first prize in the logic class." Prizes have always been numerous, often not very discriminating in their subjects, in Glasgow College, and he records: " Prizes distributed; got three of them."

In all his youthful days he luxuriated in fishing and field sports, and nobody could match him at " hop, step, and jump." At an early age, when the " Edinburgh Review " was ridiculing Wordsworth, Wilson was seized with an admiration of him, and wrote him: " In all your poems you have adhered to natural feelings, and described what comes within the range of every one's observation. It is from following this plan that, in my estimation, you have surpassed every poet both of ancient and modern times." Yet he ventures to hint a fault. " No feeling, no state of mind, ought, in my mind, to become the subject of poetry that does not please." {411} In 1803 he entered, as a gentleman commoner, Magdalen College, Oxford, and participated ardently both in the high studies and in the boating and physical sports. Here he began a common-place book, which was doubtless of great use to him: " In the following pages I propose to make such remarks upon the various subjects of polite literature as have been suggested to my mind during the course of my studies by the perusal of writers on the different branches of human knowledge; reflections upon law, history, philosophy, theology, and poetry, will be classed under separate heads." With regard to the department of poetry, original verses of my own composition will be frequently introduced." " Should any reflections upon men and authors occur in my mind, even with regard to the general characters of mankind, or the particular dispositions of acquaintances and friends, they shall be written down as they occur, without any embellishment. In short, this commonplace book, or whatever else it may be called, will contain, so far as it goes, a faithful representation of the state of my mind, both in its moments of study and retirement."

At the close of his Oxford life he passed, in 1806, a brilliant examination. "Sotheby was there, and declared it was worth while coming from London to hear him translate a Greek chorus." On leaving college, having, as he believed, an independent fortune, he betook himself to the Lake country of England, and purchased Elleray, within nine miles of Wordsworth, and henceforth may be regarded as one of the Lake poets. He now divided his activities between poetry and rural sports, and "had a small fleet on Windermere." By 1810 he had written as many poems " as will make a volume Of 400 pages," of which the principal was " The Isle of Palms," descriptive of sea and island scenery, with a love story. In 1811 he was married to Miss Penny. A few years later he lost suddenly the fortune which his father had laid up for him so industriously. He bore the trial manfully, but had to remove to Edinburgh to the home of his mother, and he became an advocate. He did not acquire a large practice at the bar, and had time to write novels and poems, which were noticed favorably in the " Edinburgh Review."

Jeffrey asked him to write for the " Edinburgh," and he furnished an article on Byron. But Wilson was destined to occupy a place of his own. "Blackwood's Magazine" was

started in 1817 by others, but did not become a power till it came under the control of Wilson. He was never formal editor. Blackwood retained the management in his own hand; and, knowing that literary men were commonly both needy and dilatory, he kept them to punctuality by not remunerating them till they produced the articles, and then paying them handsomely. But the winds and the sails were given to the vessel by Wilson, and "Blackwood " immediately became the best literary magazine of its day.

So that city of Edinburgh is still maintaining its high literary reputation. In Jeffrey they have a representative of the talent, and in Scott, with Wilson in an inferior degree, representatives of the genius of their country. The " blue and yellow " is the organ of the one and old " ebony of the other. The one favors taste and judgment; the other originality and literary beauty. The one is seeking to improve things, has no great {412} reverence for the wisdom of the ancients, looks forward to the future, and is considerably cool and indifferent towards religion; the other likes things as they are, has a profound reverence for old customs and feudal castles, and speaks highly of the forms of religion as established by law and custom,

"Blackwood's Magazine" is the great work of Wilson. his tales are full of sentiment too; much in the manner of Mackenzie, -- so much so as to be at times cloying as treacle. He professes to describe the trials and sorrows of the poor; but it is clear that he paints them as one who, with a warm heart, has viewed them at a distance, and who has never truly be come one of them. His poor are certainly not the Scotch poor, with their deep feeling, which oppresses them all the more that it cannot get an out let except in brief and restrained phrases, showing that they are repressing what should be allowed to flow out. His poetry is certainly beautiful in imagery and expression, but has too redundant foliage in proportion to the stem and branches which support it, and often wants a healthy air and a manly bearing. But the whole soil of Wilson comes out in the "Noctes Ambrosianm." We have here an extravaganza full of all excellencies and defects, of fun and frolic, wit and humor, fancies and imaginations, shrewd wisdom and ingenious nonsense, of offensively personal comment and genuine pathos, of drinking, swearing, morality, and religion, -- which, however, always smells of the whiskey punch of the tavern. The whole is a sort of rhapsody which reads like an inspiration, but breathing more of the soil of earth than the air of heaven. It is a waste, newly turned up, and yielding an exuberance of seeds and trees, flowers and fruit; but with weeds and chills and fevers.

In 1820, when Brown died, there was a keen struggle for the chair of moral philosophy. Sir James Mackintosh might have had it, but could not resist the temptations of politics and London society. The contest lay between Wilson and Sir William Hamilton known already as a scholar, but not as an author. The town council was unreformed; the tories had the political power of the city; they were annoyed by the attacks of Jeffrey and jealous of the growing liberal spirit fostered by the philosophical professors of the University. So Wilson was started and warmly supported by

the government. Scott, the literary genius of Edinburgh, threw himself thoroughly into the canvass for Wilson, who received the appointment. Every one felt that Scottish metaphysics had suffered a reverse; but some rejoiced at this, as feeling that the Scottish colleges were too exclusively metaphysical, and introduced students to philosophy at too early an age, and they expected Wilson to give an impulse to literary culture.

We have a record in the "Memoir" of the attempts of the literary man and the poet to produce a course of lectures on philosophy. He would commence with some attractive and eloquent introductory lectures of a "popular though philosophical character, so as to make a good impression at first on his students and also on the public," and so he proposes to give eight or ten lectures on the moral systems of ancient Greece. Then he is to have six or more lectures on the physical nature of man. And now the difficulties meet him. Must he tread in the steps of Reid and Stewart {413} "which to avoid would be of great importance "? " Surely," he says, " we may contrive to write with more spirit and effect than either of them; with less formality, less caution; for Stewart seems terrified to place one foot before another." Then he would branch forth on taste and genius, which he was glad to find had been treated of by the Scotch moralists. Then comes the moral nature, the affections, and conscience, or whatever name that faculty may be called; and he anticipates that the passions and affections will furnish fine ground for description. Then there is the will and all its problems; " but here I am also in the dark." One more lecture on man's spiritual nature will make fifty-eight in all. " I would fain hope that something different from the common metaphysical lectures will produce itself out of this plan." Then he would treat of duties to God and man; of virtues and vices, -- in all, 108 lectures. Such was his projected plan. In later years he modified it, giving more time to the moral faculty, on which he did not throw any light.

He was never very systematic in his course. He enlarged on subjects suited to him, and was always poetical, often eloquent. The writer of this article remembers the impression left as he passed one day into his class-room. The students received him with applause. -- I believe they always did so; and he advanced in a rapid, genial manner, fresh as if he had just come from the Highlands or Lake country. He produced a roll of papers, some of them apparently backs of letters. I could not discover where he was in his course, but I soon found myself carried along pleasantly but irresistibly by a glowing description of faith, of its swaying and elevating influence. On another occasion I found him enlarging on the place which association has in forming our imaginations. I am not able to give his theory, but it seemed to me at the time fresh and original. His pupils felt that it was a stimulating thing to be under such a man. "One indubitable advantage," says Mr. Hill Burton, "was possessed by all Professor Wilson's students who had I eyes to see and ears to hear,' viz., the advantage of beholding closely the workings of a great and generous mind swayed by the noblest and sincerest impulses, and of listening to the eloquent utterances of a

voice which, reprobating every form of meanness and duplicity, was ever raised to its loftiest pitch in recommendation of high-souled honor, truth, virtue, disinterested love, and melting charity." Another pupil, Mr. A. Taylor Innes, describes him: 'His appearance in his class-room it is far easier to remember than forget. He strode into it with the professor's gown hanging loosely on his arms, took a comprehensive look over the mob of young faces, laid down his watch so as to be out of the reach of his sledge-hammer fist, glanced at the notes of his lecture (generally written on the most wonderful scraps of paper), and then, to the bewilderment of those who had never heard him before, looked long and earnestly out of the north window towards the spire of the old Town Kirk, until, having at last got his idea, he faced round and uttered it with eye and hand and voice and soul and spirit, and bore the class along with him. As he spoke, the bright blue eye looked with a strange gaze into vacancy, sometimes sparkling with a coming joke, sometimes darkening before a rush of indignant eloquence, the tremulous upper lip curving with {414} every wave of thought or hint or passion, and the golden-gray hair floating on the old man's shoulders." He had no philosophy himself, and so could not impart it to his pupils. But at times he made a profound remark, as when, in the " Noctes," he says: " Honesty is the best policy, but it is only the honest man who will discover this." Hamilton, who was ardently attached to the man praises his metaphysical acuteness as shown in a review of Brown's theory of cause and effect in " Blackwood" for 1837.

But his true merit consisted in creating a literary taste among his students. He was not a very rigid examiner or exacter of essays, and idle students passed through his class without much severe study. But he read conscientiously the papers given in to him, and was a discerning critic, particularly appreciative of excellence. The more ambitious youths cherished secretly or avowedly the idea that they might be asked by him to write a communication to dear old North for "Blackwood;" but Wilson had to consult the tastes of his readers, and their hopes had often to be disappointed.

Thus did be pass his rather lengthened life, ever looking after the magazine with which he identified himself, lecturing all winter to his students, taking excursions in the summer, and very often dining in company in the evening where the wine and the wit flowed freely, and where he was always the favorite. In 1850 his health began to break down. He retained his universal sympathy all along. His ruling passion was strong in death. " It was an affecting sight to see him busy, nay, quite absorbed, with the fishing tackle scattered about his bed where he lay propped up with pillows." " How neatly he picked out each elegantly dressed fly from its little bunch, drawing it out with trembling hand along the white coverlet, and then replacing it in his pocket-book; he would tell ever and anon of the streams he used to fish in of old." The prospect of death produced more solemn feelings, and he betook himself to the Bible, "for is not all human nature and all human life shadowed forth in these pages? " The tender and anxious question which he asked concerning Robert Burns, " Did he read his Bible?"

may, perhaps, by some be asked about himself. On a little table near his bedside his Bible lay during his whole illness, and was read morning and evening regularly. His servant also read it frequently to him. Thus departed John Wilson, April 2, 1853. {415}

LVII.-SIR WILLIAM HAMILTON.[102]

H/E\ is the most learned of all the Scottish metaphysicians. Not that the Scottish school ought to be described, as it has sometimes been, as ignorant. Hutcheson was a man of learning, as well as of accomplishment, and visibly experienced great delight in quoting the Greek and Roman philosophers, as he walked up and down in his class-room in Glasgow. Adam Smith had vast stores of information; and the ground-plan which he has left of departments of ancient philosophy, and the sketch of the sects which he has given in his " Moral Sentiments," show that he was more competent, had he devoted his attention to the subject, than any man of his age to write a history of philosophy. Hume had extensive philosophic, as well as historical, knowledge; but he was so accustomed to twist it to perverse uses, that we cannot trust his candor or accuracy. Reid was pre-eminently a well-informed man. His first printed paper was on quantity. He taught in Aberdeen College, according to the system of rotation which continued even to his day, natural as well as moral philosophy; and continued, even in his old age, to be well read on all topics of general interest. Beattie and Campbell were respectable scholars, as well as elegant writers; and the former was reckoned at Oxford, and by the English clergy, as the great expounder, in his day, of sound philosophy. Lord Monboddo was deeply versed in the Greek and Roman philosophies, and in spite of all his paradoxes has often given excellent accounts of their systems. Dugald Stewart was a mathematician as well as a metaphysician; and, if not of very varied, was of very correct, and, altogether, of very competent, ripe, and trustworthy scholarship. Brown was certainly not widely or extensively read in philosophy; but, besides a knowledge of medicine, he had an acquaintance with Roman and with modern French literature. Sir James Mackintosh was familiar with men and manners, was learned in all social questions, {416} and had a general, though certainly not a very minute or correct, knowledge of philosophic systems. But, for scholarship, in the technical sense of the term, and, in particular, for the scholarship of philosophy, they were all inferior to Hamilton, who was equal to any of them in the knowledge of Greek and Roman systems, and of the earlier philosophies of modern Europe -- [1] and vastly above them in a comprehensive acquaintance with all schools; and standing alone in his knowledge of the more philosophic fathers, such as Tertullian and Augustine; of the more illustrious schoolmen, such as Thomas Aquinas and Scotus; of the writers of the Revival, such as the elder Scaliger; and of the ponderous systems of Kant, and the schools which ramified from him in Germany.

When he was alive, he could always be pointed to as redeeming Scotland from the reproach of being without high scholarship. Oxford had no man to put on the same level. Germany had not a profounder scholar, or one whose judgment

in a disputed point could be so relied on. Nor was his the scholarship of mere words: he knew the history of terms, but it was because he was familiar with the history of opinions. In reading his account, for example, of the different meanings which the word " idea" has had, and of the views taken of sense-perception, one feels that his learning is quite equalled by his power of discrimination. No man has ever done more in clearing the literature of philosophy of commonplace mistakes, of thefts and impostures. He has shown all of us how dangerous it is to quote without consulting the original, or to adopt, without examination, the common traditions in philosophy; that those who borrow at second hand will be found out; and that those who steal, without acknowledgment, will, sooner or later, be detected and exposed. He experiences a delight in stripping modern authors of their borrowed feathers, and of pursuing stolen goods from one literary thief to another, and giving them back to their original owner. For years to come, ordinary authors will seem learned by drawing from his stores. In incidental discussions, in foot-notes, and notes on foot-notes, he has scattered nuts which it will take many a scholar many a day to gather and to crack. It will be long before the rags which shine from him will be so scattered and diffused through philosophic literature as the sunbeams are through the atmosphere-that they shall {417} become common property, and men shall cease to distinguish the focus from which they have come.

The only other decided lineament of his character that I shall mention is his logical power, including therein all such exercises as abstraction, generalization, division, definition, formal judgment, and deduction. In this respect he may be placed along side of those who have been most distinguished for this faculty such as, Aristotle, Saint Thomas, Descartes, Spinoza, Samuel Clarke, Kant, and Hegel. In directing his thoughts to a subject, he proceeds to divide, distribute, define, and arrange, very much in the manner of Aristotle: take, as an example, his masterly analysis of the primary qualities of matter. He pursues Much the same method, in giving the history of opinions, as on the subjects of the principles of common sense and perception. No man ever displayed such admirable examples of Porphyry's tree, reaching from the <summum genus> to the <infirma species>. It is quite clear that, had he lived in the days of the schoolmen, he would have ranked with the greatest of them, -- with Albertus Magnus, Thomas Aquinas, Duns Scotus, and Abelard, -- and would have been handed down to future generations by such an epithet as Doctor Criticus, Doctor Doctissimus, or Doctor Indomitabilis.

Here, however, his strength is his weakness. He attempts far too much by logical differentiation and formalization. No man purposes now to proceed in physical investigation by logical dissection, as was done by Aristotle and the schoolmen. I have at times looked into the old compends of physical science which were used in the colleges down even to an age after the time of Newton. Ingenious they were beyond measure, and perfect in form far beyond what Herschel or Faraday have attempted. I am convinced that logical operations can do nearly as little in the mental as they have done in the material sciences. I

admit that Sir William Hamilton had deeply observed the operations of the mind, and that his lectures contribute more largely to psychology than any work published in his day. But his induction is too much subordinated to logical arrangement and critical rules. His system will be found, when fully unfolded, to have a completeness such as Reid and Stewart did not pretend to, but it is effected by a logical analysis and synthesis, and much that he has built up will require to be taken down. {418}

We may compare him with the Scotch metaphysician who had the greatest reputation when Hamilton determined to claim a place for himself. Brown and Hamilton are alike in the fame which they attained, in the influence which they exercised over young and ardent spirits, in the interest which they excited in the study of the human mind, and in their success in upholding the reputation of the Scottish colleges for metaphysical pursuits: each had an ambition to be independent, to appear original and establish a system of his own; both were possessed of large powers of ingenuity and acuteness, and delighted to reduce the compound into elements; and each, we may add, had a considerable acquaintance with the physiology of the senses: but in nearly all other respects they widely diverge, and their points of contrast are. more marked than their points of correspondence. They differed even in their natural disposition. The one was amiable, gentle, somewhat effeminate, and sensitive, and not much addicted to criticism; the other, as became the descendant of a covenanting hero, was manly, intrepid, resolute, -- at times passionate, -- and abounding in critical strictures, even on those whom he most admires. As to their manner of expounding their views, there could not be a stronger contrast. Both have their attractions; but the one pleases by the changing hues of his fancy and the glow of his sentiment, whereas the other stimulates our intellectual activity by the sharpness of his discussions, and the variety and aptness of his erudition. The one abounds in illustrations, and excites himself into eloquence and his readers into enthusiasm: the other is brief and curt; seldom giving us a concrete example; restraining all emotion, except it be passion at times never deigning to warm the students by a flash of rhetoric and presenting only the naked truth, that it may allure by its own charms. If we lose the meaning of the one, it is in a blaze of light, in a cloud of words, or in repeated repetitions: the quickest thinkers are not always sure that they understand the other, because of the brevity of his style, and the compression of his matter; and his admirers are found poring over his notes, as the ancients did over the responses of their oracles. The one helps us up the hill, by many a winding in his path, and allows us many a retrospect, when we might become weary, and where the view is most expanded; whereas {419} the other conducts us straight up the steep ascent, and, though be knows all the paths by which others have mounted, he ever holds directly on; and if there be not a path made for him, he will clear one for himself. Both were eminently successful lecturers: but the one called forth an admiration of himself in the minds of his whole class; whereas the other succeeded in rousing the energies of select minds, in setting them forth

on curious research, and in sharpening them for logical dissection. One feels, in reading Brown, as if he were filled and satisfied but sometimes as he finds in the digestion, the food has been far from substantial: whereas we are forced to complain, in regard to Hamilton, that he gives us the condensed essence, which the stomach feels great difficulty in mastering. The one never coins a new technical word, when the phrases in current use among the British and French philosophers of the previous century will serve his purpose; the other delights to stamp his thoughts with a nomenclature of his own, derived from the scholastics or the Germans, or fashioned out of the Greek tongue: and so the one feels soft as a bird of delicate plumage, whereas the other is bristling all over with sharp points like a porcupine. The works of the one remind us of Versailles, with its paintings, its woods, its fountains,-- all somewhat artificial, but beautiful withal; those of the other are ruled and squared like the pyramids, and look as if they were as lofty, and must be as enduring.

Both were extensive readers: but the reading of the one was in the Latin classics, and the works of the well-known authors of England and France in the last century; whereas the other ranged over all ancient literature, and over the philosophic systems of all ages and countries; delighted supremely in writings which had never been read since the age in which they were penned; troubled many a librarian to shake the dust from volumes which no other man had ever asked for; and must, we should think, have gratified the dead, grieving in their graves over neglect, by showing them that they were yet remembered. The one delights to show how superior he is to Reid, to Stewart, to the Schoolmen, to the Stagyrite; the other rejoices to prove his superior learning by claiming for old, forgotten philosophers the doctrines attributed to modern authors, and by demonstrating how much we owe to the scholastic ages and to Aristotle. {420}

Both departed so far from the true Scottish school: but the one went over to France for refinement and sentiment, the other to Germany for abstractions and erudition. If Brown is a mixture of the Scottish and French schools, Hamilton is a union of the schools of Reid and Kant. Brown thought that Reid's influence was too high, and had a secret desire to undermine him and Stewart with him; Hamilton thought that Brown was over-rated, and makes no scruple in avowing that he labors to strip him of the false glory in which he was enveloped; and he took up Reid at the time he was being decried in Scotland, and allowed no man -- but himself -- to censure the commonsense philosopher. Brown had no sense of the merits of Kant, and did his best (along with Stewart) to keep him unknown for an age in Scotland; Hamilton was smitten with a deep admiration of the great German metaphysician, helped to introduce him to the knowledge of Scottish thinkers, was caught in his logical network, and was never able thoroughly to extricate himself.

As to their method of investigation, both employ analysis as their chief instrument, but the one uses a retort and proceeds by a sort of chemical composition, while the other employs a lens and works by logical division. In comparison with Reid and Stewart, both erred by excess of

decomposition and overlooked essential parts of the phenomenon; but the object of the one was to resolve all mental states into as few powers as possible, whereas the aim of the other was to divide and subdivide a whole into parts, which be again distributes into compartments of a framework provided for them. The one has added to the body of philosophy mainly by his acute analyses of concrete phenomena and by his illuminated illustrations of psychological laws; the other by his vast erudition, which enabled him to dispose under heads the opinions of all philosophers, and by his skill in arranging the facts of consciousness by means of logical division and distribution.

Brown acquired a wide reputation at an early date; but, like those showy members of the female sex who have many admirers but few who make proposals of union, he has had scarcely any professing to follow him throughout. His most distinguished pupil, Dr. Welsh, was possessed of a fine philosophic spirit, but abandoned Scotch metaphysics for phrenology and for theological and ecclesiastical studies. Several eminent {421} men, not pupils, have been influenced by Brown. Payne's work on Mental and Moral Science is drawn largely from his lectures. Isaac Taylor, in his "Elements of Thought," has adopted some of his peculiarities. Chalmers had to prepare his lectures Oil moral philosophy when Brown's name was blazing high in Scotland, and, feeling an intense admiration of his eloquence and of the purity of his ethical system, has followed him perhaps further than he should have done, but has been kept from following him in several most important points by his attachment to Reid and Butler. John Stuart Mill has got the very defective metaphysics which underlies and weakens much of his logic from his father, James Mill, from Brown, and from Comte. Still, Brown has no school and few professed disciples. It is different with Hamilton. His influence, if not so extensive -- to use a favorite distinction of his own -- has been more comprehensive. His articles in the " Edinburgh Review were above the comprehension, and still further above the tastes, of the great body even of metaphysical students in Great Britain when they appeared between 1829 and 1833. But they were translated by M. Peisse into the French language, and there were penetrating minds in Britain, America, and the Continent which speedily discovered the learning and capacity of one who could write such dissertations. By the force of his genius he raised up a body of pupils ready to defend him and to propagate his influence. He has had a school and disciples, as the Greek philosophers had in ancient times, and as such men as Descartes, Leibnitz, and Kant have had in modern times. His pupils employ his distinctions and delight in his nomenclature: their speech everywhere "bewrayeth" them. Some of them, it is true, remind us of a modern soldier in mediaeval coat of mail, and move very cumbrously under the ponderous armor of their master; but, as a whole, they constituted an able and influential school of abstract philosophy. Some of them seem incapable of looking on any subject except through the well-cut lenses which Hamilton has provided for them others seem dissatisfied with his negative conclusions, and with his rejection a la Kant of final cause as a proof of the divine existence, but then, do not seem to have the courage to examine and separate the

truth from the error in that doctrine of relativity on which his whole system is founded. {422}

While Hamilton has thus been establishing a school and acquiring an authority, it has not been without protest. In saying so, I do not refer to the criticisms of his attacks on the character and doctrines of Luther, which have been repelled by Archdeacon Hare and others, but to opposition offered to his philosophic principles. There has been a general dissent even by disciples, such as Mansel, from his doctrine of causation, and, if this tenet is undermined, his elaborate scheme of systematized "Conditions of the Thinkable" is laid in ruins. Dr. Calderwood has opposed his negative doctrine of the infinite. Others, not pupils, have expressed doubts of his whole theory of relativity. Ulrici, in the leading philosophic journal of Germany, "Zeitschrift fur Philosophie" (1855), has charged him with departing in his method from the standpoint of Scotland, with giving in to the critical method of Kant, and ploughing with the German heifer, and alleges that he or his school must advance with Germany. As the unkindest cut of all, Mr. Ferrier, who was supported by Hamilton in the competition for the moral philosophy chair in Edinburgh when Professor Wilson retired, and with whom Hamilton (as he assured the writer of this article) was long in the habit of consulting, published the " Institutes of Metaphysic," which is a complete revolt against the whole Scottish philosophy; and Kant was not more annoyed with the idealism of Fichte than Hamilton was with the " Object plus Subject " of Ferrier. There has been an able review of him from the stand-point of Hegel by Mr. Sterling. But the most formidable attack was made on him in 1865 by John Stuart Mill in his "Examination of the Philosophy of Sir William Hamilton." The physiological psychologists and materialists of the present day are seeking to turn away the attention from him.

William Hamilton was born in the dingy Professors' Court of Glasgow College, March 8, 1791. He was the son of Dr. Thomas Hamilton, professor of anatomy and natural history in that college, and, it is worthy of being noted, physician to the family of Thomas Reid. He was the lineal descendant of Sir Robert Hamilton, the not very wise commander of the Covenanters at Drumclog, and through him, of the Hamiltons of Preston, who claim to be descended from the second son of the progenitor of the Duke of Hamilton; and he succeeded in {423} establishing his claim to the title of Sir William Hamilton. Having lost his father in early life, he was boarded for some time with the Rev. Dr. Summers, the parish minister at Mid Calder, and was afterwards sent to a school at Bromley, where he was taught classics in the thorough old English style. He entered the University of Glasgow in 1803, attended three winters, and there studied logic under Jardine, and moral philosophy under Mylne, standing at the head of his class in both departments, by the votes of his fellow-students -- the method of determining honors at that time when competitive examinations had not been exalted into so exclusive a place. By this time he had become an irregular, but most insatiable devourer and also an eager collector of books -- in the end his library amounted to nearly ten thousand volumes. In 1807 he was sent up on the Snell foundation to Oxford, and

entered Balliol College. Here he took his share in the boating and other gymnastic exercises, but entered with far more eagerness into the study of Aristotle, the favorite of Oxford at that time. " His manner of reading was characteristic. He had his table, chairs, and generally his floor strewed with books; and you might find him in the midst of this confusion studying with his foot on a chair, poising one great folio on his knee, with another in his hand. His mode of 'tearing out the entrails of a book,' as he termed it, was remarkable. A perusal of the preface, table of contents, and index, and a glance at those parts which were new to him, which were few, were all that was necessary." The paper which he gave in at his examination for the degree was preserved as being singular:

"Divinity: Aristotle's Philosophy of Man.
"Theoretical: De Anima, &c.
"Practical-Moral-Ethic: Nic., Mag., Cic. Op. Ph.
  Domestic: OEcon. Civil: De Republ.
"Instrumental: Logic: Organon. Rhetoric: Ars. Rhet.,
  Cic. Op. Rhet Poetic: De Poetica Pindar, Eschylus."

"He allowed himself to be examined on more than four times the number of philosophical and didactic books ever wont to be taken up even for the highest honors; and those, likewise, authors far more abstruse than had previously been attempted in the schools; while at the same time he was examined in more than any ordinary complement of merely {424} classical works." In 1812 he went to Edinburgh, and in the following year, he became an advocate. He lived in the house of his mother, and married an estimable lady, Miss Janet Marshall, a niece of his mother's. In 1820, when Brown died, he became a candidate for his chair, and had the support of Dugald Stewart, who was greatly impressed with his learning and philosophical ability. He was not particularly successful at the bar, and every one rejoiced when, in 1821, he was appointed professor of universal history by the faculty of advocates, the patrons of the chair. His class was not a language one; but he studied and expounded rare and profound subjects. About this time phrenology, as expounded by George Combe, was favored by a considerable body of people in Edinburgh; and Hamilton set himself determinedly against it. He conducted numerous experiments with his own hands, sawing open skulls, dissecting and testing the weight of brains: he is said to have weighed one thousand brains belonging to above fifty species of animals. In 1827, he published in the "Edinburgh Review," his famous article on Cousin and the philosophy of the conditioned. This was followed in 1830 by an article on perception, and on Reid and Brown; and in 1833 by an article on Whately and on logic. In 1836 he was appointed professor of logic and metaphysics in the University of Edinburgh, in opposition to Isaac Taylor, supported by the religious public, and George Combe, supported by the phrenologists. He has now a large class of students, numbering from perhaps one hundred and twenty to one hundred and fifty, and he prepared for them the courses of lectures in logic and metaphysics, which he, or his assistants for him, delivered each successive session, till his decease. Having occasion to prelect on Reid, his labors led, in 1856, to his edition

of Reid's "Collected Works, with Notes and Dissertations," which was left unfinished by him, but had additions made to it after his death by papers which he had written. In 1852 the articles in the " Edinburgh were republished in the " Discussions on Philosophy," with large additions on university education, including his vehement and senseless diatribe against mathematics. Some years before his death he had a stroke of paralysis, which partially affected his speech and his power of using his pen, and his lectures had to be read in part or in whole by an assistant, {425} while his lady acted as his amanuensis. A second attack carried him off, after a few days' illness, May 6, 1856.

Mr. George Moir describes his person: "The massive though well-cut features, the firm compressed mouth, and the eagle-looking eye, of which the whole pupil was visible, created a feeling akin to awe. But in proportion to this apparent sternness was the charm of his smile and of his whole manner when animated." Though a most devoted reader, he never liked composition, and commonly wrote under pressure. There were stories told in Edinburgh of the nervous agitation into which he wrought himself when he had to prepare his lectures for his class. His style was always clear and clinching, but gives evidence that the writer composed painfully and elaborately, and was unwilling to waste a single unnecessary word. His temper was keen and vehement, but never mean or vindictive. When he could not carry his purposes, he might break off in a passion. He was appointed secretary to the college senatus, and there he had a great many projects for elevating the university scholarship, and often came into collision with his colleagues.

Of all thinkers Hamilton is the least disposed to call any man master; still there were forces operating upon him and making his native tendencies take the particular direction which they did. I am convinced that a wholesome tone was given to his mind by the philosophy of Reid, the metaphysician of his native college, and who died six years after Hamilton was born. Had he been trained exclusively in Oxford, he might have spent his powers in mere notes and comments on others, and we should have been without his profound original observations. Had he been reared in Germany, his speculative spirit might have wasted itself in a hopelessly entangled dialectic, like that of Hegel. To Glasgow and to Reid he owes his disposition to appeal, even in the midst of his most abstract disquisitions, to consciousness and to facts. To Oxford we may trace his classical scholarship and his love of Aristotle, the favorite for long ages with technical Oxonian tutors. We only wish that he had been led to drink as deep into Plato as he did into Aristotle: it would have widened his sympathies, and rubbed off some acute angles of his mind, and made his philosophy less cold and negative. A third master mind exercised {426} as great a power over him as either Reid or Aristotle. In prosecuting his researches, he was necessarily led beyond the narrow scholarship of Britain into the wide field of German learning, and while ranging there could not but observe that there was a constant reference to the name of Kant. The logical power of the author of the "Critic of Pure Reason" at once seized his

kindred mind, and he eagerly took hold of his critical method, and adopted many -- I think far too many of his distinctions. Kant exercised as great an influence over him as even Reid did. His whole philosophy turns round those topics which were discussed in Kant's great work; and he can never get out of those "forms " in which Kant set all our ideas so methodically, nor lose sight of those terrible antinomies, or contradictions of reason which Kant expounded, in order to show that the laws of pure reason can have no application to objects, and which Hegel gloried in and was employing as the ground principle of his philosophy. From Kant he got the principle that the mine begins with phenomena instead of things, and builds thereon by forms or laws of thought; and it was as he pondered on the sphinx enigmas of Kant and Hegel, that he evolved his famous axiom about all positive thought lying in the proper conditioning of one or other of two contradictory propositions, one or other of which must, by the rule of excluded middle, be void. Fortunately he fell in, at the same time, with the less hard and more genial writings of Jacobi, who taught him that there was a faith element as well as a rational element in the human mind; but, unfortunately, Jacobi thought that faith was opposed to reason, and had no distinct views as to the nature of faith, or as to the harmony between faith and reason. To this source we may trace those appeals which Hamilton is ever making to faith, but without specifying what faith is. To his legal studies we may refer somewhat of his dry manner and his disputatious spirit. His readings in connection with the chair of history enabled him to realize the precise condition of the ages in which the opinions of philosophers were given forth. The catholic views which his extensive reading led him to adopt set him in determined opposition to the miserably narrow sensational school of France, and to Professor Mylne, of Glasgow, and Dr. Thomas Brown, who had given way too much to that school. The lofty {427} spiritual views which he had caught from Reid and Kant set him against materialism; and his medical studies, to which his father's profession may have directed him, enabled him to meet phrenology, and to give an admirable account of the physiology of the senses. Such was the course of training which he had gone through when he was asked to write a review of Cousin, and found himself face to face with the philosophy of the absolute.

In contemplating these two eminent philosophers, -- Hamilton and Cousin, -- then brought into collision, it is difficult to say whether one is most struck with their resemblances or their differences. They are alike in respect of the fulness and the general accuracy of their scholarship. Both are alike distinguished for their historical knowledge and critical power. Even here, however, we may observe a contrast,-Cousin being the more universal in his sympathies, and Hamilton being the more discriminating and the more minutely accurate in his acquaintance with rare and obscure authors. Both, perhaps, might have had some of their views expanded, if, along with their scholarship, they had entered more thoroughly into the inductive spirit of modern physical researches. But the age of universal knowledge is past, and it is vain to expect that any human capacity will contain all learning. Both are original, vigorous, and independent thinkers; and both are

distinguished by a catholic spirit in philosophy: but the one is more Platonic, and the other more Aristotelian, in his tastes and habits. The one delights to show wherein he agrees with all others, the other is more addicted to show wherein he differs from all others. Both are clear writers: but the one is distinguished by the eloquence of his composition and the felicity of his illustrations; the other, by the accuracy and expressiveness of his, at times, harsh nomenclature. Cousin is, undoubtedly, the man of finest genius and most refined taste; the other appears to me to have been the man of coolest and most penetrating intellect. The one makes every subject of which he treats irridescent by the play of his fancy; the other bands it into a structure of great solidity by the rigidity of his logic. Both were admirers of the German as well as the Scottish schools of philosophy; but Cousin's predilections were at one time more towards the {428} former, and of a later date he became more attached to the latter; whereas Hamilton started more in the Scottish spirit, and swung latterly towards the German method. The two came into collision when the Scotchman reviewed the Frenchman in the " Edinburgh Review." But when Hamilton became a candidate for the chair of moral philosophy in Edinburgh he received powerful and generous aid from his rival; and when Hamilton published his edition of Reid, he dedicated it to M. Victor Cousin.

The writer of this article has a very vivid recollection of Sir William in happening to pass into his class-room a year or two after his appointment. There was an evident manliness in his person and his whole manner and address. His features were marked, he had an eye of a very deep lustre, and his expression was eminently intellectual. He read his lecture in a clear, emphatic manner, without show, pretension, or affectation of any kind. His nomenclature sounded harsh and uncouth to one unacquainted with it, but his enunciations were all perspicuous and explicit. The class was a large one, numbering I should suppose 150. At the opening there was a furious scribbling, visible and audible, by all the students in their notebooks; but I observed that, as the lecture proceeded, one after another was left behind, and, when it was half through, at least one-third had ceased to take notes, and had evidently lost their interest in, or comprehension of, the subject. Unfortunately for the Scottish colleges, unfortunately for the youth attending them, students enter the logic class in the second year of their course, when the majority are not ripe for it. A course of lectures, like that given by Jardine of Glasgow, might be fit for such a class, but not a rigid course like that of Hamilton, who did, indeed, make his thoughts as clear as such profound thoughts could be made, but could not bring them down to the comprehension of a promiscuous class, of which many are under seventeen, and some under sixteen, or even fifteen years of age. But even among second year students there were every year a larger or less number who rejoiced to find that he first awakened independent thought within them, and who were ready to acknowledge ever afterwards that they owed more to him than to any other professor, or to all the other professors under whom they studied. {429}

In his examinations be expected a sort of recitation of his lectures from the students. He also encouraged his pupils to submit to voluntary examinations on private studies undertaken by them. He prescribed essays on subjects lectured on, and in these essays he allowed great latitude in the expression of opinions, and some of his students, out of a spirit of independence or contradiction, would at times take up the defence of Dr. Brown, and were not discouraged. All students of high intellectual power, and especially those of a metaphysical taste, received a stimulus of a very lofty kind from his lectures, and these examinations and essays. I suspect that some of the duller and idler passed through the class without getting much benefit. In his whole intercourse with young men there was great courtesy and kindness, and a readiness to appreciate talent and independent thinking wherever he found it. For a number of years before his death, Sir William was oppressed with infirmities, and had to employ an assistant; and it was characteristic of him that he was in the habit of selecting for the office some one of those who had been his more distinguished students. We may now look at his metaphysics and his logic.

<Metaphysics>. The first of the volumes is on philosophy generally and on mental philosophy in particular. He begins by recommending the study, gives the definitions, unfolds the divisions, explains the terms with amazing erudition and unsurpassed logical precision, and dwells largely on consciousness, its laws and conditions. The reading of this volume will prove as bracing to the mind as a run up a hill of a morning on a botanical or geological excursion is to the body. We especially recommend the study of it to those whose pursuits are usually of a different character, as, for example, to those who are dissipating their minds by light literature, or whose attention has been directed exclusively to physical facts, and who have thus been cultivating one set of the faculties which God has given them, to the neglect of others, and have thus been putting their mental frame out of proper shape and proportion, -- as the fisher, by strengthening his chest and arms in rowing, leaves his lower extremities thin and slender. There is a fine healthy tone about his defence of the liberal as against the more lucrative sciences, which latter Schelling called <Brodwissenchaften>, {430} which Hamilton wittily translates, <the bread and butter sciences>. He quotes with approbation the well-known sentiment of Lessing, " Did the Almighty, holding in his right hand Truth, and in his left <Search after Truth>, deign to tender me the one I might prefer,-in all humility, but without hesitation, I would request Search after Truth." But we should concur in such statements as these only with two important explanations or qualifications; the one is, that the search be after truth, which we must value when we find it; and the other is, that it be after attainable and useful truth. It has been the great error and sin of speculative philosophy that it has been expending its strength in building in one age ingenious theories which the next age takes down. I maintain that such activity wastes the energy without increasing the strength. He who thus fights is like one beating the air, and his exertion ends, not in satisfaction, but in weariness and restlessness. The

admirable test of Bacon here comes in to restrain all such useless speculation, viz., that we are to try them by their fruits. Had this been the proper place we could have shown that Bacon's doctrine on this subject has often been misunderstood. He does not say that science is to be valued for its fruits, but it is to be tested by its fruits; just as faith, which, however, is of value in itself, is to be tried by the good works to which it leads. Thus limited and thus understood, there is profound wisdom in the caution of Bacon, which will not discourage an inductive inquiry into the human mind, its laws and fundamental principles, but will lay a restraint on the profitless metaphysical theories which have run to seed prematurely in Germany, where thinkers are sick of them, and are now being blown into our country and scattered over it like the down of thistles.

This volume is full of brief and sententious maxims. Take the following as examples: --

> "It is ever the contest that pleases us, and not the victory. Thus it is in play; thus it is in bunting; thus it is in the search after truth; thus it is in life. The past does not interest, the present does not satisfy, the future alone is the object which engages us." "What man holds of matter does not make up his personality. They are his, not be; man is not an organism, -- he is an intelligence served by organs." "I do not mean to assert that all materialists deny or actually disbelieve a God. For in very many cases this would be at once an unmerited compliment to their reasoning, {431} and an unmerited reproach to their faith." "Wonder has been contemptuously called the daughter of ignorance; true, but wonder we should add is the mother of knowledge" "Woe to the revolutionist who is not him self a creature of the revolution ! If he anticipate he is lost, for it requires what no individual can supply, a long and powerful counter-sympathy in a nation to untwine the ties of custom which bind a people to the established and the old."

The following is his tabular view of the distribution of philosophy:-

Mind or Consciousness
- Facts -- Phaenomenology, Empirical Psychology
  - Cognitions,
  - Feelings
  - Conative Powers (Will and Desire)
- Laws -- Nomology, Rational Psychology
  - Cognitions -- Logic
  - Feelings -- Aesthetic
  - Conative Powers
    - Moral Philosophy
    - Political Philosophy
- Results -- Ontology, Inferential Psychology
  - Being of God
  - Immortality of the Soul, &c.

I set little value on this division. The same topics would require to be discussed under more than one head. In his lectures Sir William has taken up only one of the three

grand general groups, viz., Empirical Psychology, and even this he has discussed only in part. A portion of the second group is treated of in his lectures on logic. On the others he never entered.

It will be seen from the above table that he followed Kant in giving a threefold distribution of the mental faculties into the Cognitive, the Emotive, and the Conative. This is an improvement on the old division by Aristotle into the cognitive and motive, or of that of the schoolmen into the understanding and the will. Still it is not complete and exhaustive. He is obliged to include the imagination in the first head, and yet it can scarcely be called a cognitive power, though, of course, it implies a previous cognition. The conscience comes in under the conative powers; but, in fact, the conscience partakes of the nature both of a cognitive and conative power. It is one of the defects of the arrangement that it does not allot a clearly separate place to the conscience.

The following is his division of the cognitive powers: --

1. Presentative
   External -- Perception.
   Internal -- Self-Consciousness
2. Conservative
   Memory
3. Reproductive
   Without Will -- Suggestion
   With Will -- Reminiscence
4. Representative
   Imagination
5. Elaborative
   Comparison -- Faculty of Relation
6. Regulative
   Reason -- Common sense

{432}

The account of the cognitive powers in the first 332 pages of the second volume, down to the regulative powers, not included, will be regarded in the end, if I do not mistake, as the most valuable part of Sir William Hamilton's metaphysics. His pupils will probably fix on the very part I have designedly excepted, viz., the regulative faculties, as being the most important. Farther on in this article I mean to show that he has greatly misapprehended the nature of these regulative powers. Meanwhile let us look at the account which he has given of the other mental faculties.

I. Like the Scotch metaphysicians he paid great attention to the Senses. His views were first given to the world in his article in the " Edinburgh Review," republished in the Discussions, and have been expanded in his notes on Reid and in his class lectures. He has a famous arrangement of the various forms which have been taken by the ideal theory of sense-perception. Realists are either natural, who maintain that we know the external thing directly; or hypothetical (cosmothetic idealists), who suppose that there is a real world not directly known. Idealists are absolute or presentative, who suppose that there is only the idea; or

cosmothetic or representative (hypothetical realists) who bold that we know the external thing by a representation. The possible forms of the representative hypothesis are three: (1) The representative object not a modification of mind, but an extra-mental object, physical or hyperphysical; (2) The representative object a modification of mind, dependent for its apprehension, but not for its existence, on an act of consciousness, say an idea in the mind, as was held apparently by Locke; (3) The representative object a modification of mind, non-existent out of consciousness, the idea and its perception only different relations of an act (state) really identical; the view taken by Arnauld and Brown. The distinctions thus drawn are of great importance, and should be kept steadily in view in judging of theories. But his divisions do not embrace all cases. Dr. Brown does not bold by the ideal, but the causal or inferential, theory; and Hamilton has missed the mark in his criticism of him.

I am inclined to agree with him that our original perceptions are probably of our organism, or of objects in immediate contact with it. This doctrine seems to have been expounded {433} simultaneously by Hamilton; by Saisset, the French metaphysician; and by John Muller, the physiologist. On one small point I would differ from Hamilton. Our original perceptions through the eye do not seem to me to be points of light, but of a colored surface affecting our organism, but at what distance we cannot say till experience comes to our aid. But the doctrine identified with his name is that of immediate perception. He intended to take the same view as Reid did, and, when he began to edit Reid's works, he thought that their opinions were the same. But, as he advances, he sees that they differ; and he ends by doubting whether Reid was after all a realist. Reid's doctrine is, that there is first an organic affection; then a sensation in the mind; and, thirdly, a perception suggested by an unreasoning and instinctive process. Hamilton's doctrine is, that, following the organic affection, there is simultaneously a sensation and perception, the one being strong as the other is weak, and <vice versa>; that is, when the sensation is lively the perception is faint, and when the perception is prominent the impression is feeble. Both, however, agree in the main point, that the process is intuitive and that there is no reasoning involved. Hamilton's doctrine is specially that of <immediate> perception; that is, of perception without a medium.

It is objected to Hamilton's theory, that he overlooks the numerous intermediate processes revealed by physiology. In vision there are the rays of light; the reflection and refraction of them, the picture on the retina, an action along the optic nerve to the seat of sensation, an action thence we know not how to the brain, an action in the cells which constitute the gray matter surrounding the brain, and then, or perhaps not even then, but only after some farther steps, the perception of the object, say a tree, from which the rays of light come. How it is asked can perception be immediate, when all these media are evidently implied? To this the followers of Hamilton might reply, that he never thought of disputing the existence of steps between the

external object and the percipient mind, which, when it comes into exercise, contemplates the tree, and not an image or representation of it in the mind, in the body or out of the body. But the objection may now take a somewhat different form. It may be urged that, after all, we do not see the tree, {434} and it will be asked, What do we perceive intuitively? Certainly not the brain cells, or the influence transmitted to them, or the action of the sensorium, or even the image on the retina, or the coats and humors of the eye, or the vibrations that constitute the light. What, then, do we perceive? Hamilton. allowed that it was not the distant tree; for he adopted the Berkleian theory of vision, and held that we are immediately percipient of distance by the eye. What, then, do we see immediately? Hamilton was helped here by another doctrine of his, that the mind may be said to be indiscriminately in the brain and in the whole nervous apparatus, so long as it keeps up its connection with the centre; and by the further doctrine that our primary perceptions are of our bodily frame and of objects in contact with it. In taste, smell, and hearing, we perceive the palate, nostrils, ear; in feeling, our extended frame; and by the muscular sense an extra-organic object resisting our energy. The proper account is, that in sense-perception, when formed, we perceive our frame as affected or objects affecting the frame. I am ready to allow as many processes as the physiologist can prove to exist in the nervous system and brain prior to perception. But I hold that perception is a mental and not a bodily act. We hold further that nervous action, and brain action and cellular, do not constitute perception, which is knowledge. I assert that, while there may be bodily antecedents, they are not properly the causes of perception or any proper mental act, such as the perception of beauty or of moral excellence. I may add that I have no objections to find them represented as the occasions or conditions of sense-perception, not therefore of our higher mental acts. If we hold, as I hold, that in creature action all causes are concauses, that is composed of more than one agent, then the brain action may be an agent, a necessary but inferior agent, in producing perception, the main agency being a capacity of the mind. I am inclined to go a step further, and to allow that the defenders of natural realism might admit for the sake of argument, and admit out and out if proven, that there is a process of reasoning in every perceptive operation, even in such an operation as perceiving snow as a colored surface -- just as all admit that there is inference when we place that snow on a mountain too at a distance. But still they will insist that when mind perceives matter, it {435} perceives it as out of itself, and as extended; that it cannot infer this from a nervous action, or from an unextended sensation or impression within the mind; and that the perception of an external, extended object, be it in the body or beyond the body, must be immediate, intuitive, and original.

II. Sir William Hamilton has been much landed for the view which he has given of Consciousness. In this I cannot concur. He avows that he uses consciousness in two distinct senses or applications. First, he has a general consciousness treated of largely in the first volume. This he tells us cannot be defined. (Vol. I. P. 158.) " But it

comprehends all the modifications, -- all -- the phenomena of the thinking subject." (p. 183.) ',Knowledge and belief are both contained under consciousness." (p. 191.) Again, "consciousness is co-extensive with our cognitive faculties." " Our special faculties of knowledge are only modifications of consciousness." (P. 207.) He shows that consciousness implies discrimination, judgment, and memory. (P. 202-206.) This is wide enough: still he imposes a limit; for consciousness " is an immediate not a mediate knowledge." (p. 202.) Already, as it seems to me, inconsistencies are beginning to creep in -- for he had told us first that consciousness includes "all the phenomena of the thinking subject;" now be so limits it as to exclude ,mediate knowledge," which is surely a modification of the thinking subject. Consciousness is represented as including belief; and yet it must exclude all those beliefs in which the object is not immediately before us. He stoutly maintains what no one will deny, that this general consciousness is not a special faculty; but when he comes to draw out a list of faculties in the second volume, he includes among them a special faculty, which he calls consciousness, but to which, for distinction's sake, he prefixes self, and designates it self-consciousness. It is the office of this special faculty to afford us a knowledge of the phenomena of our minds." (Vol. II. p. 192.) He justifies himself in drawing a distinction between sense-perception and self-consciousness on the ground that, " though the immediate knowledge of matter and of mind are still only modifications of consciousness, yet that their discrimination as subaltern faculties is both allowable and convenient."

Such is the doctrine and such the nomenclature of Hamilton {436} on this subject. I confess that I have great doubts of the propriety of applying the phrase "consciousness," both in this general and specific way. In the first sense "Consciousness constitutes, or is co-extensive with all Our faculties of knowledge," and he speaks of our being endowed with a faculty of cognition or consciousness, in general (Vol. 2. p. 10), and says that " consciousness may be regarded as the general faculty of knowledge." Now it is certainly desirable to have a word to denote our faculties of knowledge, or of immediate knowledge but why not call them knowing powers, or cognitive powers, and their exercise or energy, knowledge or cognition, and then the word " consciousness " would be reserved unambiguously for the cognizance which the mind takes of self in its particular states. The word (from <con scio> to know together with) seems the appropriate one to denote that knowledge of self which co exists with all our other knowledge of things material or things spiritual; and indeed with all our other mental exercises, such as feelings and volitions. It is certainly in this sense that the term is employed by Hutcheson, by Reid, by Stewart, by Royer Collard; and all Hamilton's vehement criticisms of these men are inapplicable and powerless, for this very obvious reason, that they use the word consciousness as he uses self-consciousness, acknowledged by him to be a special faculty. It is an inevitable result of using the phrases in two senses, a wider and a straiter, that we are ever in danger of passing inadvertently from the one meaning to the

other, and making affirmations in the one sense which are true only in the other. I rather think that Hamilton himself has not escaped this error, and the confusion thence arising. lie is ever appealing to consciousness, as Locke did to ideal and Brown did to suggestion; but we are not always sure in which of the senses, whether in both, or in one, or in which one. He is ever ascribing powers to consciousness, which he would have explained, or modified, or limited, if the distinction had been kept steadily in view. Thus he is often announcing that consciousness is the universal condition of intelligence; if this is meant of the general consciousness, it can mean no more than this, that man must have knowing powers in order to know; if meant of the special consciousness, it is not true; it is rather true that there must be some mental exercise as a condition of the knowledge of {437} self. He calls the principles of common sense the facts of consciousness, emphatically; whereas these principles, as principles, are not before the consciousness as principles at all. The individual manifestations are of course before the consciousness (though not more so than any other mental exercise), but not the principles themselves, which are derived from the individual exercises, by a reflex process of abstraction and generalization. He speaks everywhere as if we must ever be conscious at one and the same time of subject and object, -- meaning external object; whereas we may be conscious of the subject mind thinking about some state of self present or absent. His <quondam> friend, Professor Ferrier, carried the doctrine a step farther, and maintained that a knowledge of self is a condition of all knowledge of not self, whereas it is merely a fact that the one co-exists with the other in one concrete act, in which we know not self to be different from self, and independent of self.

III. The Conservative, Reproductive, and Representative faculties might all have been included, I think, under one head, with subdivisions. The account which he gives of this group is upon the whole the best which we have in our language. Still there are oversights in it. Thus, in order to make the analysis complete, I should have had the recognitive power, or that which recognizes the object recalled as having been before the mind <in time past>. Had he given this power a separate place, he would have seen more clearly than he does how the idea of time arises. Along with the mere representative power he should have mentioned the compounding or grouping power of imagination, which combines the scattered images into one new whole. He refers at times to man's native power of using signs; why not specify a symbolic power, enabling man to think by signs standing for notions.

In explaining the nature of the conservative or retentive faculty, and elsewhere, he has unfolded some peculiar views which I consider to be as correct as they are profound, but he carries them to a length which I am not prepared to allow. What is the state of an idea when not falling at the time under consciousness? This is the question which has often been put. Thus having seen the Crystal Palace of 1851, the question is put, -- what place has that idea in my mind, when {438} I am not precisely thinking about the object? Is it dead or simply dormant? We

must of course answer that the idea can have no existence as an idea, when not before the consciousness. Still it must have some sort of existence. There exists in the mind a power to reproduce it according to the laws of association. The writer of this article having had occasion, years ago, to pass over the plains of Lombardy, is not therefore always imaging them, but he has the power of recalling them, and finds that they are recalled every time he hears of the jealousies between Austria and Italy. It is a great truth that the mind is ever acquiring potency, is ever laying up power. We have something analogous in the physical world. Thus a power coming from the sun in the geological age of the coal-measures was laid up in the plant, went down into the strata of the ground, and comes up now in our coals ready to supply us with comfortable heat in our rooms, and with tremendous mechanical force for our steam-engines. This is the doctrine of all the physicists of our day. But there is a similar laying up of power in the mind, of intellectual, and we may add, of moral or immoral power. Aristotle had certainly a glimpse of some such doctrine, and spoke of a <dunamis>, an <entelecheia>, and an <energeia>; the first denoting the original capacity, the second -- the capacity in complete readiness to act, and the third the capacity in act or operation. Modern mechanical science is enunciating this doctrine in a more definite form, and distinguishing between capacity and potential energy and actual energy. Sir William Hamilton, taking the hint from Aristotle, has adopted the views of the German Schmid (who again had certain speculations of Leibnitz before him), who declares that the energy of mind which has once been cannot readily be conceived as abolished, and that " the problem most difficult of solution is not how a mental activity endures, but how it ever vanishes." (Vol. II. P. 212.)

So far I can concur; but when he maintains that there are in the mind, acts, energies, and operations, of which it is not conscious, I hesitate and draw back. His doctrine on this subject is founded on the views of Leibnitz, as to there being perceptions below consciousness. The class of facts on which he rests his opinion seem to me to be misapprehended. {439} "When we hear the distant murmur of the sea, what are the constituents of this total perception of which we are conscious? " He answers that the murmur is a sum made up of parts, and that if the noise of each wave made no impression on our sense, the noise of the sea as the result of these impressions could not be realized. " But the noise of each several wave at the distance, we suppose, is inaudible; we must, how ever, admit that they produce a certain modification beyond consciousness, on the percipient object." (Vol. I. P. 351.) He speaks of our perception of a forest as made up of impressions left by each leaf, which impressions are below consciousness. There is an entire misinterpretation of the facts in these statements, and this according to Hamilton's own theory of the object intuitively perceived. The mind is not immediately cognizant of the sound of the sea or of its several waves; nor of the trees of the forest and their several leaves. All that it knows intuitively is an affection of the organism as affected by the sound or sight. The impression made by the distant object is on the organism, and when the impression is sufficiently strong on the organism, the mind is called into

exercise, and from the organic affections <argues> or <infers> the external and distant cause. Thus there is no proof of a mental operation of which we are unconscious.

He explains by these supposed unconscious acts a class of mental phenomena with which every one who has ever reflected on the operations of his own mind is familiar. The merchant walks in a brown study from his house to his place of business; there must have been many mental acts performed on the way, but they are now all gone. The question is, were they ever before the consciousness? Hamilton maintains that they never were; Dugald Stewart maintains that they were for the time, but that the mind cannot recall them. Notwithstanding all the acute remarks of Hamilton, I adhere to the theory of Stewart. I do so on the general principle that in devising a theory to explain a set of phenomena we should never call in a class of facts, of whose existence we have no other proof, when we can account for the whole by an order of facts known to exist on independent evidence. Hamilton says: "When suddenly awakened during sleep (and to ascertain the fact I have caused myself to be roused at different seasons of the {440} night), I have always been able to observe that I was in the middle of a dream;" but adds, "that he was often scarcely certain of more than the fact that he was not awakened from an unconscious state, and that we are often not able to recollect our dreams." He gives, as the peculiarity of somnambulism, that we have no recollection when we awake of what has occurred during its continuance. (Vol. I. P. 320-322.) Every one will admit that we are often conscious of states at the time, which we either cannot remember at all, or (what will equally serve our purpose) more probably cannot remember, except for a very brief period after we have experienced them. We have thus an established order of facts competent to explain the whole phenomenon without resorting to a Leibnitzian doctrine, which has been applied by certain later German pantheists to show how existence may rise gradually from deadness to life, and from unconsciousness to consciousness.

Under the head of the reproductive faculties he has two profound lectures on the Association of Ideas. In the close of his edition of Reid there is a learned disquisition on the well-known passage of Aristotle, in which he gives, with his usual brevity, a classification of. laws which regulate the train of our thoughts. Hamilton so interprets that passage as to make Aristotle announce one generic law and three special ones. I am unwilling to set my authority against so accurate a scholar as Hamilton -- , but I have often looked into that passage, and can find no evidence of Aristotle having resolved all into one law. In the same note Hamilton had begun to expound his own theory, but broke off, and closed the book in the middle of a sentence. Most readers will feel that the account given in these lectures, though somewhat fuller, is far too brief, and illustrated by too few examples to be easily understood. His pupils could not be more profitably employed than in fully unfolding the doctrine of their master on this subject, and applying it to explain the well-known phenomena. He thinks that the whole facts can be explained by one great law, which he calls the law of redintegration, which he finds incidentally expressed by Augustine. This law may be thus enounced, -- "Those

thoughts suggest each other which had previously constituted parts of the same entire or total act of cognition." (Vol. II. p. 238.) He again quotes Schmid Thus {441} the supreme law of association, -- that activities excite each other in proportion as they have previously belonged as parts to one whole activity, -- is explained from the still more universal principle of the unity of all our mental energies in general." (P. 241.) I am inclined to look on this as, on the whole, the most philosophical account which has been given of the law of association. It at once explains the cases of simple repetition in which one link of a chain of ideas which had previously passed through the mind, being caught, all the rest come after; as when we have got the first line of a poem committed to memory, and the others follow in order. It easily explains, too, all cases in which we have had a variety of objects before us in one concrete act, -- thus if we have passed along a particular road, with a certain person, observing the mountain or river in front, and talking on certain objects, -- we find that when any one of these recurs it is apt to suggest the others. It is thus if we have often heard in youth the cry of a particular animal, goose or grouse, turkey or curlew, the cry will ever bring up afresh the scenes of our childhood. It is more doubtful whether the law can explain a third class of cases when it is not the same which suggests the same, but an object suggests another object which has never been individually associated with it, but is like it, or is otherwise correlated with it; as when the conqueror Alexander suggests Julius Caesar or Bonaparte. It needs an explanation to show how the law can cover such a case, which, however, I rather think it can, though I am by no means inclined to admit the explanations of the Hamiltonians proceeding on their narrow and peculiar view of correlates.

IV. This leads us to refer to the next faculty, -- the Elaborative, equal to Comparison, -- that is the Faculty of Relations. The phrase elaborative is an expressive epithet, but is not a good special denomination, as there is elaboration in other exercises as well as in this. Comparison, or the correlative faculties, or the faculties of relation, is the better epithet. Under this head he has some learned and acute remarks on the abstract and the general notion, and on language, and is terribly severe, as usual, on Dr. Thomas Brown. I am of opinion that Brown's views on this subject are, in one or two points, more enlarged than those of Hamilton himself, who has over {442} looked essential elements. " In so far," he says, "as two objects resemble each other, the notion we have of them is identical, and, therefore, to us, the objects may be considered as the same." (Vol. II. pp. 294.) I cannot give my adherence to this doctrine of the identity of resembling objects. Altogether his account of the relations which the mind can discover is narrow and exclusive. He specifies first the judgment virtually pronounced in an act of perception of the <non-ego>, or an act of self-consciousness of the <ego>; then secondly the something of which we are conscious and of which the predicate existence is twofold, the <ego> and the <non-ego>; thirdly, the recognition of the multiplicity of the co-existent or successive phenomena, and the judgment in regard to their resemblance or dissimilarity; fourthly, the comparison of the phenomena

with the native notion of substance; fifthly, the collection of successive phenomena under the native notion of causation. He might have seen a much broader and more comprehensive account of the relations which the mind can perceive in Locke's "Essay" (B. II. C. 28); in Hume's " Treatise on Human Nature" (B. I. P. i. 5); or in Brown's Lectures (Lect. xlv.) I am surprised he has never made a reference to such relations -- on which the mind so often dwells -- as those of space, time, quantity, properties of objects, cause and effect, and moral good.

V. We have now only to consider, and in doing so have to discuss, the Regulative Faculties of the mind. I like the phrase regulative, only we must dissociate it from the peculiar sense in which it is used by Kant (from whom Hamilton has borrowed it), who supposes that the mind in judging of objects imposes on them a relation not in the objects themselves. The epithet expresses that such principles as substance and quality, cause and effect, are "the laws by which the mind is governed in its operations " (Vol. II., P. I 5), which laws I may add -- but Hamilton would not-are not before the consciousness as principles when we exercise them. In calling them faculties, he acknowledges that he uses the word in a peculiar signification. (P. 347.) The truth is Hamilton does not see the relation in which they stand to the faculties: they are not separate faculties, but are involved in all the faculties, being, in fact, the necessary laws which spontaneously and unconsciously {443} guide their exercise. His treatment of this subject in a more elaborate manner, in the " Conditions of the Thinkable Systematized, or the Alphabet of Human Thought," appended to the Discussions, and in a somewhat more popular manner in his Lectures, was probably regarded by himself, and is certainly regarded by his admiring pupils, as the most important contribution made by him to philosophy. On the other hand, I look on the system as being, on the whole, a failure. He has labored to combine the philosophies of Reid and Kant; but we see everywhere the chinks at the line of junction. The principles of common sense looking at objective truth, will not join on to the empty forms which imply and -- guarantee no reality. In the construction of his philosophy of the relative or conditioned, as he calls it, he has expended an immense amount of logical ability; but he has lost himself in Kantian distinctions, giving in to Kant's theory as to space and time, making them, and also cause and effect, merely subjective laws of thought and not of things; and the system which be has reared is an artificial one, in which the flaws and oversights and rents are quite as evident as the great skill which he has shown in its erection. I dispute three of his fundamental and favorite positions.

(1) I dispute his theory of relativity. I acknowledge that there is a sense in which human knowledge is relative. There is a sense in which all thinkers, except those of the extravagant schools of Schelling and Hegel, hold a doctrine of relativity; but this is not the same as that elaborated by Hamilton: " From what has been said you will be able to understand what is meant by the proposition that all our knowledge is only relative. It is relative,-first, because existence is not cognizable absolutely and in itself, but

only in special modes; second, because these modes can be known only if they stand in a certain relation to our faculties , and, thirdly, because the modes thus relative to our faculties are presented to, and known by, the mind only under modifications determined by these faculties themselves." (Vol. I., p. 148.)

In these three general propositions, and in the several clauses, there are an immense number and variety of assertions wrapped up: to some I assent, from others I as decidedly dissent. I acknowledge, first, that things are known to us {444} only so far as we have the capacity to know them; in this sense, indeed, even the divine knowledge is relative. I acknowledge, secondly, that we do not know all things; nay, that we do not know all about any one thing. Herein human knowledge differs from the divine: but the word relative is not the phrase to attach to human knowledge; in order to point out the difference, it would be better to say that man's knowledge is partial or finite as distinguished from perfect or absolute. I may admit, thirdly, that man discovers external objects under a relation to himself and his cognitive mind. So much, then, I freely allow. But, on the ether hand, I demur, first, to the statement that we do not know existence in itself, or, as he expresses it elsewhere in Kantian phraseology, that we do not know the thing in itself (Ding an sich). I do not like the language: it is ambiguous. I doubt whether there be such a thing as " existence in itself and, of course, what does not exist cannot be known. If he mean to assert that we do not know things as existing, I deny the statement. Every thing we know, we know as existing; not only so, but we know the thing itself, -- not all about the things, but so much of the very thing itself. Then I demur secondly, to the statement, which is thoroughly Kantian, that the mind in cognition adds elements of its own: as he expresses it elsewhere, " Suppose that the total object of consciousness in perception = 12; and suppose that the external reality contributes 6, the material sense 3, and the mind 3; this may enable you to form some rude conjecture of the nature of the object of perception." (Vol. II., p. 129.) I allow that sensations, feelings, impressions associate themselves with our knowledge: but every man of sound sense knows how to distinguish between them, and it is surely the business of the philosopher not to confound them, but to point out the essential difference. To suppose that in perception, or cognition proper, the mind adds any thing, is a doctrine fraught with perilous consequences; for, if it adds one thing, why not two things, or ten things, or all things, till we are landed in absolute idealism, or, what is nearly allied to it, in absolute scepticism?

The defective nature of the whole Hamiltonian philosophy comes out in its results. Comparing his philosophy with that {445} of Germany he says: " Extremes meet. In one respect both coincide, for both agree that the knowledge of nothing is the principle or the consummation of all true philosophy, `<Scire nihil, -- studium quo nos laetamur utrique.>' But the one doctrine openly maintaining that the nothing must yield everything, is a philosophic omniscience, whereas the other holding, that nothing can yield nothing, is a philosophic nescience In other words:

the doctrine of the unconditioned is a philosophy confessing relative ignorance, but professing absolute knowledge; while the doctrine of the conditioned, is a philosophy professing relative knowledge, but confessing absolute ignorance." (Dis. p. 609.) Surely this is a pitiable enough conclusion to such an elaborate process. A mountain labors, and something infinitely less than the mouse emerges.

I suspect that Sir William Hamilton was wont to meet all such objections, and try to escape from such a whirlpool as that in which Ferrier would engulf him, by taking refuge in belief, -- in faith. And I am thoroughly persuaded of the sincerity of his faith, philosophic and religious. But it is unsatisfactory, it is unphilosophic, to allow that cognition and intelligence may lead to nihilism, and then resort to faith to save us from the consequences. Surely there is faith involved in the exercises of intelligence; there is faith (philosophical) involved, when from a seen effect we look up to an unseen cause. I am sure that human intelligence does not lead to absolute knowledge, but as little does it lead to scepticism or to nothing. Of this I am further sure, that the same criticism which pretends to demonstrate that intelligence ends in absolute ignorance, will soon -- probably in the immediately succeeding age -- go on to show with the same success, that our beliefs are not to be trusted.

The same doctrine of relativity carried out led him to deny that there could be any valid argument in behalf of the divine existence, except the moral one. I acknowledge that the moral argument, properly enunciated, is the most satisfactory of all. I admit that the argument from order and adaptation (the physico-theological) can prove no more, than that there is a living being of vast power and wisdom, presiding over the universe; but this it can do by the aid of the law of cause and effect properly interpreted. The proof that this Being is in {446} finite must be derived from the mental intuition in regard to the infinite. Hamilton has deprived himself of the power of using the arguments from our belief in causation and infinity by what I regard as a defective and mutilated account of both these intuitions. He has nowhere stated the moral argument which he trusts in. I suspect that the criticism which cuts down the argument from intelligence, needs only to be carried a step further to undermine the argument from our moral nature. This process has actually taken place in German), and I have no desire to see it repeated among metaphysical youths in this country. It is on this account, mainly, that I have been so anxious to point out the gross defects in the account given by Hamilton of our necessary convictions.

(2) I dispute his doctrine of causation. It is so lamentably defective in the view taken of the nature of cause, and so perversely mistaken in the theory grounded on this view, that several of his most distinguished disciples have been obliged to abandon it. The following is his account of effect and cause " An effect is nothing more than the sum or complement of all the partial causes, the concurrence of which constitutes its existence." I remember no eminent philosopher who has given so inadequate a view of what constitutes cause. It leaves out the main element, --

the power in the substance, or, more frequently, substances, acting as the cause to produce the effect. It leads him to represent the effect as an emanation from previously existing elements, a doctrine which he turns to no pantheistic use, but which has, undoubtedly, a pantheistic tendency. Taking such a view it is no wonder that he should represent creation as inconceivable; for the only creation which he can conceive, according to his theory, is not a creation of a new substance by God, but a creation out of God. Thus defective is his view of cause in itself. His view of the internal principle, which leads us, when we discover an effect to look for a cause is equally inadequate. According to him it is a mere <impotence> to conceive that there should not be something out of which this effect is formed; and, to complete the insufficiency of his theory, he makes even this a law of thought and not of things. Surely all this is in complete opposition to the consciousness to which he so often appeals. Our conviction as to cause is not a powerlessness, but a power; not {447} an inability, but an ability. It is an intuitive and necessary belief that this effect, and every other effect, must have a cause in something with power to produce it.

(3) I dispute his theory as to our conviction of infinity. We are," he says, "altogether unable to conceive space as bounded-as finite; that is, as a whole beyond which there is no farther space." " On the other hand, we are equally power less to realize in thought the possibility of the opposite contradictory: we cannot conceive space infinite or without limits." (VOL. "., P. 369, 370.) The seeming contradiction here arises from the double sense in which the word " conceive " is used. In the second of these counter propositions the word is used in the sense of imaging or representing in consciousness, as when the mind's eye pictures a fish or a mermaid. In this signification we cannot have an idea or notion of the infinite. But the thinking, judging, believing power of the mind is not the same as the imaging power. The mind can think of the class fish, or even of the imaginary class mermaid, while it can not picture the class. Now, in the first of the opposed propositions the word "conceive" is taken in the sense of thinking, deciding, being convinced. We picture space as bounded, but we cannot think, judge, or believe it to be bounded. When thus explained all appearance of contradiction disappears indeed all the contradictions which the Kantians, Hegelians, and Hamiltonians are so fond of discovering between our intuitive convictions, will vanish if we but carefully inquire into the nature of these convictions. Both propositions, when rightly understood, are true, and there is no contradiction. They stand thus: -- "We cannot image space as without bounds:" "we cannot think that it has bounds or believe that it has bounds." The former may well be represented as a creature impotency; the latter is, most assuredly, a creature potency, is one of the most elevated and elevating convictions of which the mind is possessed, -- and is a conviction of which it can never be shorn.

It will be seen from these remarks that I refuse my adherence to his peculiar theory of relativity, and to his maxim that " positive thought lies in the limitation or conditioning of one or other of two opposite extremes,

neither of which, as unconditioned, can be realized to the mind as possible, and yet {448} of which, as contradictions, one or other must, by the fundamental laws of thought, be recognized as necessary." (Reid's " Works," P. 743.) It fails as to causation and as to infinity, and he has left no formal application of it to substance and quality, where, as Kant showed, there is no such infinite <regressus>, as in infinite time and space or cause. He would have found himself in still greater difficulties had he ventured elaborately to apply his theory to moral good. As I believe him to have been on the wrong track, I scarcely regret that he has not completed his system and given us a doctrine of rational psychology or ontology. Indeed I have no faith whatever in a metaphysics which pretends to do any more than determine, in an inductive manner, the laws and faculties of the mind, and, in doing so, to ascertain, formalize, and express the fundamental principles of cognition, belief, judgment, and moral good. The study of logic began to revive from the time that Archbishop Whately constrained it to keep to a defined province. The study of metaphysics would be greatly promoted if the science would only learn to be a little more humble and less pretending, and confine itself to that which is attainable.

<Logic>. We may now look at his work on Logic, which is a very elaborate one, and contains very able discussions and learned notes. It proceeds upon a very thorough acquaintance with Aristotle and his commentators, with the schoolmen and the logical writers of the seventeenth century; but was directly suggested by the Kantian criticism and amendment of logic, and by the works of such men as Esser, Fries, Krug, and Drobisch, who carried out the principles of the great German metaphysician. just as the " Port Royal Logic " has all the excellencies and defects of the philosophy of Descartes, so the logic of Hamilton has the combined truth and error of the metaphysics of Kant. It should be added, that his analytic; so far drawn from German sources in some of its fundamental views, is, after all, Hamilton's own, in the way in which it is wrought out and applied. Logic is defined as "the science of the laws of thought as thought." It is represented to be an <a priori> science. "It considers the laws of thought proper as contained <a priori> in the nature of pure intelligence." He does not state, and evidently does not see, that these laws of thought, while not the laws of the objects of thought, {449} are laws of thought as employed about objects, and can be discovered not <a priori>, but simply by an observation of the workings of thought.

He reviewed the not very philosophical but very shrewd and useful work of Whately, in the " Edinburgh Review " for 1833, criticising it with terrible severity, and giving indications of his own views. He was already cogitating his system, he expounded it to his class after he became professor, and he gave it to the public in "An Essay toward a new Analytic of Logical Forms," being that which gained the prize proposed by Sir William Hamilton, in the year 1846, for the best exposition of the new doctrine propounded in his lectures, with an historical appendix, by Thomas Spencer Baynes. It would require a treatise as elaborate as Hamilton's two volumes to state and examine it in detail,

but I may notice some of the fundamental points.

<The Concept>. It proceeds on the distinction between the extension and comprehension of a term or notion. He makes no pretensions to the discovery of this principle. He knew that it was stated in the "Port Royal Logic," and that it was taught in Glasgow University by Hutcheson. Professor Baynes has shown in his translation of the "Port Royal Logic" that there were anticipations of it in earlier works. Hamilton carries out the distinction more thoroughly than it had ever been before. " The comprehension of a concept is nothing more than the sum or complement of the distinguishing characters or attributes of which the concept is made up; and the extension of a concept is nothing more than the sum or complement of the objects themselves, whose resembling characters were abstracted to constitute the concept." (Vol. I., P. 148.) If we except his exposition of this distinction, he does not seem to me to throw much light, otherwise, on the first part of logic, -- the part as it appears to me which has most need to be cleared up. He draws no distinction between the general notion and the abstract notion, but treats of both under the one designation, concept. But surely there is a distinction between two such notions as "animal" on the one band, embracing an indefinite number of objects, and " life," which has not a complement of objects, but is only an attribute of objects. {450}

<Judgment>. He claims originality chiefly for his doctrine of the thorough quantification of the predicate. "Touching the principle of an explicitly quantified predicate, I bad by 1833 become convinced of the necessity to extend and correct the logical doctrine on this point." " Before 1840 I had become convinced that it was necessary to extend the principle equally to negatives." (Vol. "., P. 209.) This doctrine, as Professor Baynes shows, had been partially anticipated, but had never been fully carried out. I am inclined to admit that the credit, if there be any credit, in the thorough quantification of the predicate belongs to Hamilton. But I set no value on the supposed improvement. It proceeds on the simple logical postulate, "to state explicitly what is thought implicitly." I admit the principle, but deny that it requires the predicate to be universally quantified. When we say "the dog barks," we make the predication, without inquiring in thought whether there are or are not other dogs that bark, whether dogs are all or only some barking animals. When we say " man is rational," we do not determine whether or no there are other creatures that are rational; whether, for example, angels may be called rational, whether men are "all" or only "some" rational. As the predicate is not always or even commonly quantified in spontaneous thought, so we do not require always to quantify it in the logical enunciation. At the same time, it is of importance to be able to quantify it on demand, and thus to see reflectively what is involved in every proposition. In carrying out his principles, he adds to the four classes of propositions acknowledged in the received logic A, E, I, 0, other four,

U. Common salt is chloride of sodium.
Y. Some stars are all the planets.

n. No birds are some animals.
w. Some common salt is not some chloride of sodium.

I do regard it as of moment to place in a distinct class those propositions which assert the equivalence of subject and predicate (U). But the others seem to me to be converted or rather perverted forms that never do present themselves in spontaneous thought: in which we say instead " all the planets are stars," and " some animals are not birds," and that " chloride {451} of sodium in this cellar is not the same as chloride of sodium in that salt-cellar."

It is one of the supposed advantages of his analytic that it reduces the conversion of propositions from three species to one, -- that of simple conversion. This holds true after we have converted the proposition into the form in which Hamilton has put it. When we say, "The bird sings," which is the form in spontaneous thought, Hamilton insists that logically it is, " The bird is some singing animal; " and after we have thus converted it once, the second conversion follows simply, " Some singing animals are birds." But there is nothing saved by requiring us to put every proposition in a form so different from that which it assumes in spontaneous thought.

Hamilton has done service to logic by unfolding more fully than had been done before what Kant called " syllogisms of the understanding," and which he calls immediate inferences, that is, inferences without a middle term, as when, from the proposition " All men have a conscience," we infer that some men have a conscience. He includes very properly under this head every form of conversion and opposition; and it has been shown by him and others that it includes other immediate inferences which it is important to spread out to view. But instead of placing them under reasoning, they might be allowed to remain where conversion and opposition have usually been placed, in the second part of logic.

<Reasoning>. It is an alleged advantage of his analytic that it is ,the revocation of two terms of a proposition to their true relation; a proposition being always an equation of its subject and predicate." So he says the proposition all men are mortal, means "all men = some mortal." That in some propositions the subject and predicate are equivalent may be allowed; and in such cases there may be no impropriety in using the mathematical equation, though generally it is better to allow mathematicians to keep their own symbols, as in their science they have a definite meaning, a meaning in regard to quantity; and if we introduce symbols into logic, let us introduce new symbols appropriated to the ideas. Human thought is employed about a great many other objects as well as quantity. When we say, "Virtue leads to happiness," we are not uttering a quantitative {452} statement, "Virtue = some things that lead to happiness; " but primarily an attributive assertion, that virtue has the attribute of leading to happiness, and by implication in extension, "among the things that lead to happiness is virtue."

The new analytic claims that it reduces all the general

laws of categorical syllogisms to a single canon. But what is that canon? I confess I have difficulty in finding it. Mr. Baynes states it " A syllogism is the product of that act of mediate comparison " by which we recognized that two notions stand to each other in the relation of whole and part, through the recognition that these notions severally stand in the same relation to a third. This canon is vague enough till it is explained what is meant by the relation of whole and parts. There is valid ratiocination where the relationship does not seem that of whole and parts.

Chloride of sodium is not common salt;
Pepper is not chloride of sodium;
Therefore pepper is not common salt.

In many cases the relation is one of whole and parts. But of what kind of whole? Hamilton says that it is first one of comprehension, and complains that logicians have overlooked it. Thus (Vol. I., P. 272): --

Every morally responsible agent is a free agent;
Man is a morally responsible agent;
Therefore man is a free agent, --

which is thus explained: The notion man comprehends in it the notion responsible agent; but the notion responsible agent comprehends in it the notion free agent; therefore, on the principle that a part of a part is a part of a whole, the notion man also comprehends in it the notion free agent.

But it is clear to me that in every one of these propositions there is generalization or extension implied. We have " every responsible agent," "every man," and in the class of "free agents," or "some free agents." I acknowledge that there is also comprehension involved, for all extension involves comprehension. But the uppermost thought seems to me to be in extension: Man is in the class responsible; which again is in the class free agent; consequently man is in the class free agent. Unless our knowledge of attributes is such as to enable us {453} thus to form classes, the reasoning is not valid; and the best form in which to brand out the principle involved is,

All responsible agents are free agents;
But man is a responsible agent
Therefore he is a free agent.

But if this be so, then we are back to the <dictum>, "Whatever is true of a class is true of all the members of the class." But as all extension involves comprehension, it is of moment to be able on demand to put reasoning in the form of comprehension.

It is urged in favor of the practical value of the analytic, that it makes figure unessential and reduction unnecessary. But it enlarges the number of legitimate moods, making them 36 under each figure, or in all 108, -- a number which is apt to frighten the student.

He vacillates in his account of hypotheticals and disjunctives. His final opinion is given (Vol. II., 370-378

-- " Hypotheticals (conjunctive and disjunctive), April 30, 1849"). "These syllogisms appear to be only modifications or corruptions of certain immediate inferences, for they have only two terms, and obtain a third proposition only by placing the general rule of inference (stating, of course, the possible alternatives), disguised, it is true, as the major premises.

He had divided logic into pure and modified, and he treats of the latter in Vol. ". He doubts whether there can be a modified logic; and is ever striving to impart to what he says under that head a rigidly technical form. The remarks which he throws out are often characterized by much intellectual ability, and some of them are of great value. But most of the topics discussed do not admit of so formal a treatment as he would give them. His account of the Baconian induction is a failure. The truth is, he never appreciated or understood the method pursued in the physical sciences.

The appendix contains a miscellaneous but very valuable set of papers on logical subjects. I doubt much whether Hamilton's system of logic will ever as a whole be adopted by our colleges. We have, however, two admirable text-books founded on it-. Thomson's "Outline of the Laws of Thought" and Bowen's "Logic." It will be acknowledged by all, that the discussions he has raised have done more to clear up unsettled points in {454} formal logic than any work published since the days of Kant. These discussions will be looked at by writers on logic in all coming ages.

In parting with this great man, now gone from our world, it is most satisfactory to notice what was the professed aim of all his philosophy,-- it was to point out the limits to human thought, and thereby to teach man the lesson of intellectual humility. It is instructive to find that this has been the aim of not a few of the most profound philosophers with which our world has been honored. The truth is, it is always the smallest minds which are most apt to be swollen with the wind engendered by their own vanity. The intellects which have gone out with greatest power to the farthest limits are those which feel most keenly the barriers by which man's capacity is bounded. The minds that have set out on the widest excursions, and which have taken the boldest flights, are those which know best that there is a wider region beyond, which is altogether inaccessible to man. It was the peculiarly wise man of the Hebrews who said, " No man can find out the work that God maketh from the beginning to the end." The Greek sage by emphasis declared that if he excelled others it was only in this, that he knew that he knew nothing. It was the avowed object of the sagacious Locke to teach man the length of his tether,-- which, we may remark, those feel most who attempt to get away from it. Reid labored to restrain the pride of philosophy, and to bring men back to a common sense in respect of which the peasant and philosopher are alike. It was the design of Kant's great work to show how little the speculative reason can accomplish. And now we have Sir William Hamilton showing within what narrow limits the thought of man is restrained; and the metaphysician, <par excellence>, of Oxford has, in the Bampton lectures, employed this philosophy to lay a restraint on the rational

theology of Britain, and the speculative theology which is coming like a fog from the German Ocean. It is pleas ant to think that Sir William Hamilton ever professed to bow with reverence before the revelations of the Bible, and takes delight in stating it to be the result of all his investigations, " that no difficulty emerges in theology which had not previously emerged in philosophy." In one of the letters which the author {455} of this article has had from him he proceeds on the great Bible doctrines of grace; and from all I know of him personally, I am prepared to believe in the account which I have heard from what I reckon competent authority, that the prayer which came from him at his dying hour was, " God be merciful to me, a sinner." It is most instructive to perceive the publican and the philosopher thus made to stand on the same level before the all-righteous judge.

LVIII. -- THE METAPHYSICS OF THE FUTURE.

W/HAT\ are we to make in these times of metaphysics? It is quite clear that this kind of investigation has lost, I suspect for ever, the position once allowed it, when it stood at the head of all secular knowledge, and claimed to be equal, or all but equal, in rank to theology itself. " Time was," says Kant, "when she was the queen of all the sciences; and if we take the will for the deed, she certainly deserves, so far as regards the high importance of her object-matter, this title of honor. Now it is the fashion to heap contempt and scorn upon her; and the matron mourns forlorn and forsaken like Hecuba." Some seem inclined to treat her very much as they treat those <de jure> sovereigns wandering over Europe whom no country will take as <de facto> sovereigns, -- that is, they give her all outward honor, but no authority; others are prepared to set aside her claims very summarily. The multitudes who set value on nothing but what can be counted in money never allow themselves to speak of metaphysics except with a sneer. The ever-increasing number of persons who read, but who are indisposed to think, complain that philosophy is not so interesting as the new novel, or the pictorial history, which is quite as exciting and quite as untrue as the novel. The physicist, who has kept a register of the heat of the atmosphere at nine o'clock in the morning, for the last five years, and the naturalist, who has discovered a plant or insect, distinguished from all hitherto known species by an additional spot, cannot conceal their contempt for a department of inquiry which deals with objects which can neither be seen nor handled, neither weighed nor measured. {456}

In the face of all this scorn I boldly affirm that mental philosophy is not exploded, and that it never will be exploded. Whatever men may profess or affect, they cannot, in fact, do without it. It often happens that a profession of contempt for all metaphysics, as being futile and unintelligible, is often an introduction to a discussion which is metaphysical without the parties knowing it (just as the person in the French play had spoken prose all his life without being aware of it); and of such metaphysics it will commonly be found that they, are futile and

unintelligible enough. Often is Aristotle denounced in language borrowed from himself, and the schoolmen are disparaged by those who are all the while using distinctions Which they have cut with sharp chisel in the rock, never to be effaced. There are persons speaking with contempt of Plato, Descartes, Locke, and all the metaphysicians, who are taking advantage of the great truths which they have discovered. Perhaps these individuals are telling you very solemnly that they prefer the <practical> to the <theoretical>, or that they care little for the <form> if they have the <matter>, and are profoundly ignorant that they are all the while using distinctions introduced by the Stagyrite, and elaborated into their present shape by the scholastics. But surely, they will tell you, the discovery of a new <species> of an old <genus> is a more important event than all your philosophic discoveries; and they will be surprised to learn that we owe the introduction of the phrases genus and species to Plato or to Socrates. Or perhaps they boast that they can have <ideas> without the aid of the philosophers, forgetting that Plato gave us the word <idea>, while Descartes and Locke brought it to its present signification. "Ah, but," says our novel reader, eager to discover whether the heroine so sad and forlorn in the second volume is to fall in with her lover, and be married to him before the close of the third, "metaphysics are associated in my mind with a dreary desert without and a headache within; " and is quite unaware that he is able so to express himself, because philosophers have explained that ideas are <associated>. I could easily show that in our very sermons from the pulpit, and orations in the senate, and pleadings at the bar, principles are ever and anon appealed to which have come from the heads of our deepest thinkers in ages long gone by, and who may now be forgotten by all but a few antiquarians {457} in philosophy. Our very natural science, in the hands of such men as Faraday and Mayer, is ever touching on the borders of metaphysics, and compelling our physicists to rest on certain fundamental convictions as to extension and force. The truth is, in very proportion as material science advances, do thinking minds feel the need of something to go down deeper and mount up higher than the senses can do; of some means of settling those questions which the mind is ever putting in regard to the soul, and the relation of the universe to God; and of a foundation on which the understanding can ultimately and confidently repose.

II. Metaphysics may have now to take anew start by taking advantage of physiological research. The Scottish school has never been slow to profit by the discoveries of science as to the brain, the nerves, the senses. From the first, and all along, they embraced and used all that was established in regard to the eye not being originally percipient of distance, to the distinction between the nerves of sensation, and to the reflex system in the human body; and they set themselves against premature and rash hypotheses by Hartley, by Erasmus Darwin, and by the phrenologists. But physiology in its natural and necessary progress is coming nearer and closer to the line which divides mind from matter, and in these circumstances mental science has both to watch and profit by the investigations which are being so diligently pursued.

First, metaphysics must restrain the rash inferences of mere physiologists, as Reid did the vibration theory of Hartley, as Brown did the hypotheses of Darwin as to life, and as Hamilton did the pretended science of craniology. They must make the whole educated community know, believe, and realize, that such physical actions as attraction, repulsion, and motion are one set of phenomena, and perception, reasoning, desire, and moral discernment another and a very different set of phenomena. We can trace so far into the brain what takes place when the mother sees her son thrown out from a boat on the wild waves; we can follow the rays of light through the eye on to the retina, to the sensorium, possibly on to the gray matter in the periphery of the brain; and in the end physiology may throw some light on the whole cerebral action. But in the end, as at the beginning, we are in the domain of matter and {458} motion; we have only the same action as takes place in the brain of the dog as it looks on. But when the mother's affection rises up, when she forgets herself in thinking of her boy, when she uses expedients for rescuing him, when she resolves to plunge into the water and buffets the billows till she clasps her boy and lavishes her affection on him, we are in a region beyond that reached by the physiologist,-- a region which I believe he can never reach; and it is of importance to tell him so. But the psychologist can reach that region by consciousness, and ought diligently to explore it. Whatever be the pretensions it makes, physiology has hitherto thrown little light on purely mental phenomena, and none whatever on higher mental action, such as ratiocination, the idea of the good, and resistance to temptation.

Secondly, the metaphysician must enter the physiological field. He must, if he can, conduct researches; he must at least master the ascertained facts. He must not give up the study of the nervous system and brain to those who cannot comprehend any thing beyond what can be made patent to the senses or disclosed to the microscope. I do cherish the hope that physiological psychology may in the end be rewarded by valuable discoveries. Light may be thrown on purely mental action by the fact that sensory action travels to the brain at the rate of 144.32 feet in the second, and from the brain at the rate of 108.24; that the movement is slowest in the case of the sense of sight and quickest in touch; and by what is alleged by Donders that a thought requires 1/26 of a second. There are mental actions which cannot well be explained by mental laws, such as the rise of certain states and the association of certain states; the rise, for instance, and the association of cheerful thoughts in the time of health, and of gloomy thoughts when we are laboring under derangement of the stomach. There may here be latent processes which do not fall under consciousness, but may be detected by the microscope or chemical analysis. By such researches the results reached by the psychologist may be so far modified on the one hand and considerably widened on the other. But all such investigations should be conducted by those who can understand and appreciate the peculiar nature of mental phenomena, and allow them their full and legitimate space. No physiologist can talk of, {459} or so much as refer to,

mental action without speaking of feelings, affections, thoughts, fancies, imaginations, desires, purposes, resolves; but no eye, no mechanical instrument, can detect these. They cannot be weighed in the balance or measured by the line. There is a division of the mental faculties commonly adopted in the present day into the senses and the intellect, the emotions and the will; but this distribution is suggested by the inward sense, and could never be discovered by an inspection of the compartments of the brain.

III. Metaphysics will now require to determine by the aid of physical science what truth there is in idealism. All is not real that may seem or be declared to be so. The sky is not a vault; color is produced on the visual organism by vibration in a medium; the pleasure is not in the musical sounds. To save realism we are obliged to draw distinctions, say with Aristotle, between common and proper percepts, or with Locke and the Scottish school, between the primary and secondary qualities of matter. But I have a strong conviction that all such distinctions may only be partially correct, and are only provisionally applicable. But as physical and physiological science make farther progress, we may ascertain the exact truth, and find that it clears up many obscure points. As the facts are ascertained, metaphysics should take them up, and, combining our intuitive perceptions with them, may determine precisely what we are entitled to affirm of matter. In the end some of the statements of the Scottish school as to the precise nature of the external reality may be modified or even set aside. But the great truths propounded by such men as Hamilton will only be established, and seen to rest on a basis which can never be moved. It will be acknowledged that there is an external thing independent of mind, and that this is extended, and has a passive potency. However much we may refine it, enough will be left of matter to undermine Berkleianism and every form of idealism.

IV. Metaphysics may be able to give a more accurate expression of fundamental truth. It is one of the peculiar excellencies of the Scottish school that they stand up for first truths which cannot be proven on the one hand nor set aside on the other. They are not just agreed as to the form which they should take, or the language in which they should be expressed. Mr. {460} J. S. Mill and Mr. Herbert Spencer think that they can account for all or many of these by the association of ideas or heredity. But neither of these thinkers is so bold as to maintain that he has done away with all fundamental truth. It can be shown that Mr. Mill is for ever appealing to truths which he assumes and regards himself as entitled to assume. (See " Examination of the Philosophy of J. S. Mill.") Mr. Spencer falls back on a law of necessity which testifies to a great unknown, which he allots as a territory to faith and to religion. I do not admit that he has given a proper expression to the fundamental verity or fundamental verities which he assumes. He starts on the principle of relativity, as expounded by Hamilton and Mansel, the authoritative metaphysicians when he began to speculate. I do not admit that the known logically or metaphysically implies the unknown. I am sure that his followers will leave behind them as they advance

this unknown region of faith. Following out his own method, they will account for it all by circumstances working from generation to generation. But as Mill and Spencer have not been able to get rid of first truths, so no others will and this whether they avow it or no. All processes must conduct to something ultimate. Thought requires a final resting-place, which will be found self-evident, necessary, universal. The age demands that the whole subject be rediscussed, with the view of determining what are the first, the last, and the everlasting principles of thought and truth. Some of those defended by the Scottish metaphysicians may be derivative, but they will be found to imply a root from which they are sprung. {461}

APPENDIX

{462}
{463}

APPENDIX.

ART. 1. <Extracts from MS. Letters of Francis Hutcheson to the Rev. Thomas Drennan, Minister of First Presbyterian (un-subscribing) Congregation, Belfast; lent me by his grandson, Dr. Drennan> (<see p.> 64)

<Glasgow, Jan.> 31, 1737. -- I am glad your present situation is agreeable to you. I must insist on your promise of a visit whenever you find honest Mr. Haliday (Mr. Drennan's colleague) in good health, so that he could take the whole bur den for a month or six weeks. Robert Simson, with you and Charles Moor, would be wondrous happy till three in a morning; I would be with you from five to ten. I can write you little news. Our college is very well this year as to numbers and quality of scholars, but the younger classes are less numerous as people here grow less set on a college education for lads designed for business.... I must tell you a shameful story of our college. My letter I wrote from Dublin stopped Clotworthy O'Neal getting his degree upon his first application. He got some folks in this country who are tools of the court to recommend the matter to our principal. He made a compliment of twenty guineas to the college library, and the principal watched an opportunity when there was a thin meeting, but his tools all present, and carried to him a degree in --; that too, only an honorary one, and declared so in the diploma without any certificate for his learning or manners. My dissent is entered in the books, and four more masters decline signing it."

<April> 17, 1738 -- Robert Simson, if he were not indolent beyond imagination, could in a fortnight's application finish another book which would surprise the connoisseurs. About November last, I sent a manuscript to Will Bruce chiefly for his and Mr. Abernethy's perusal. He showed it to the Bishop of Derry, who, it seems, is much pleased with it, and promises me a long epistle soon. I heartily wish you had seen it, but it did not get to Dublin till February, and was in the bishop's hands till the beginning of this month. I believe Will is perusing it now. I am not expecting it back again speedily. During our college session I get nothing done, but if I get them back

during our vacation, with remarks of my friends, I shall endeavor to put the last hand to them. If I can get leisure next month, I shall endeavor to send you such a letter as I once gave you an imperfect promise of, if my hand be not gone out of use. We have at last got a minister in Glasgow to my taste. As I know your laziness, I really wish you and he could interchange sermons now and then. I am surprised to find some people of very good sense, laymen more than clergy, here not a little pleased with some of the notions of the foreign mystics; they have raised my curiosity of late to look into these books. I shall, sometime or other, let you know the result of my reading that way. I am persuaded their warm imaginations would make them moving preachers. I am going to read Madame Bourignon when I have leisure. You'll make Sam Haliday laugh heartily by telling him this particular. My most hearty respects to him. {464}

<Glasgow, March> 5, 1738-39 -- I had yours of the 26th of February on Friday, and could not answer sooner. I had resolved, when I first read yours, to have wrote you in the negative, being in as Much hurry at present as I have been this session by many letters of business as well as by my ordinary work. I have got on my hands almost the whole paternal care of my old pupil Lord Kilmarnock's three sons here. But upon reading over your letter this morning, with the deepest concern for that worthy, friendly, generous man, I could not refuse you altogether what you desire; though I concluded it must be either an unreasonable diffidence in yourself or an unjust value your friendship makes you put upon what comes from me, that occasions such requests. I shall be forced to work in starts, with many interruptions, which never succeeds right with me; and beseech you be as busy as you can in some scheme of your own, and don't take any sudden interrupted attempts of mine as fit for all the purposes you say are expected by friends on this occasion. I hint to you my plan that you may work upon it, and be the readier to patch up a right thing out of the two: -- "A consideration of what sort of life is most worthy and best suited to a being capable of such high endowments, and improvements, and actions destined to an immortal existence, and vet subjected for a certain space to a mortal existence. in this world, and then without drawing a character, leaving it to the audience to recollect how much of this appeared in our friend's life."

I hope Jack Smith has sent down to your town a "Serious Address to the Kirk of Scotland," lately published in London; it has run like lightning here, and is producing some effect; the author is unknown; he wrote with anger and contempt of the Kirk and Confession; but it has a set of objections against the Confession which I imagine few will have the brow to answer.

I really suffer with you heartily in the loss of your worthy friend; you will miss him exceedingly, and so will your cause.

A worthy lad in this town, one Robert Foulis, out of a true public spirit, undertook to reprint for the populace an old excellent book, "A Persuasive to Mutual Love and Charity," wrote by White, Oliver Cromwell's chaplain; it is

a divine old-fashioned thing. Some are cast off in better paper, sold at 5d. in marble paper; the coarse one,, are sold at 5d. in blue paper, and at 4d. to book sellers. I wish your booksellers would commission a parcel of both sorts. There has been some whimsical buffoonery about my heresy, of which I will send you a copy.

<Glasgow, June> 1, 1741.[103] -- your countrymen very generally have such an affectation of being men and gentlemen immediately, and of despising every thing in Scotland, that they neglect a great deal of good, wise instruction they might have here. I am truly mortified with a vanity and foppery prevailing among our countrymen beyond what I see in others; and a softness and sauntering forsooth which makes them incapable of any hearty drudgery at books. We had five or six young gentlemen from Edinburgh, men of fortune and fine genius at my class, and studying law; our Irishmen thought them poor book-worms.

<Glasgow, June> 15, 1741.-The wretched turn their minds take is to the silly manliness of taverns. . . . I shall not leave Glasgow except about three weeks in July for this whole vacation, but have more avocations by too numerous an acquaintance than you can imagine. In short, Tom, I find old age not in gray hairs and other trifles, but in an incapacity of mind for such close thinking or composition as I once had, and have pretty much dropped the thoughts of some great designs I had once sketched out. In running over my papers I am quite {465} dissatisfied with method, style, matter, and some reasonings, though I don't repent my labor, as by it and the thoughts suggested by friends, -- a multitude of which I had from W. Bruce and Synge, and still more in number from some excellent friends here, -- I am fitter for my business; but, as to composing in order, I am quite bewildered, and am adding confusedly to a confused book all valuable remarks in a farrago, to refresh my memory in my class lectures on several subjects. You'll find the like. Pray lay up a good stock of sermons. You would see a noble one by one of my Scotch intimates, who sees all I do, Mr. Leechman.

<Glasgow, April> 12, 1742 -- You are such a lazy wretch that I should never write you more. Not one word of answer to my congratulatory epistle you got six weeks before you were married. Not one word of godly admonitions about spending at,. evening with friends at the Welshes Head, and other pious sentiments about the vanity and folly of staying at home in the evenings.

<Glasgow, May> 31, 1742. The bearer, Mr. Hay, takes over some copies of a new translation of Antoninus, the greater half of which, and more, was my amusement last summer for the sake of a singular worthy soul, one Foulis; but I don't let my name appear in it, nor indeed have I told it to any here but the man concerned: I hope you'll like it. The rest was done by a very ingenious lad, one Moore. Pray try your critical faculties in finding what parts I did, and what he did. I did not translate books in suite; but I one or two, and he one or two. I hope if you like it that it may sell pretty well with you about Belfast. I am sure it is doing a public good to diffuse the sentiments; and, if you

knew Foulis, you would think he well deserved all encouragement.

<Date cut off.> -- Having this opportunity, I must trouble you with a small affair. Upon conversation with Mr. Brown, who came lately from Ireland, along with Mr. Alexander Haliday, about the circumstances of some ministers, very worthy men, in your presbytery, it occurred to me that a little liberality could not be better exercised than among them. I am concerned that in my prosperous circumstances I did not think of it sooner. If you have any little contributions made towards such as are more distressed than the rest, you may mark me as a subscriber for 5L. per annum, and take the above ten pounds as my payment for the two years past. Alexander Young will advance it immediately, as I wrote him lately that I would probably draw such a bill, without telling him the purposes. I think it altogether proper you should not mention my name to your brethren, but conceal it. I am already called New Light here. I don't value it for myself, but I see it hurts some ministers here, who are most intimate with me. I have been these ten days in great hurry and perplexity, as I have for that time foreseen the death of our professor, who died last Wednesday, and some of my colleagues join me in laboring for Mr. Leechman to succeed. We are not yet certain of the event, but have good hopes. If he succeeds, it will put a new face upon theology in Scotland. I am extremely concerned for your divisions in Belfast. I find they talk of Jack Maxwell of Armagh or young Kennedy. The talents of this latter I know not, but believe he has a very honest heart. Jack Maxwell is an ingenious, lively fellow, for any thing I could discover. That presbytery will miss him much. Pray write me now sometimes. I am sorry the event in your family made some hints in my last so seasonable. But your son is now as well as if he had lived sixty years a Plato or a Caesar, or if he is not, life is scarce worth spending under such a Providence: we should all long [Greek words].

<Glasgow, August> 5, 1743 -- I have had two letters of late from Mr. Mussenden; one about five weeks ago, with an invitation to Mr. Leechman to succeed Dr. Kilpatrick. Leechman was then just upon his marriage. I concluded the matter {466} quite impracticable, and returned an answer to that purpose; and, upon conversing, Leechman found I was not then mistaken. He was lately very ill treated by our judges in a discretionary augmentation he applied for, which they could have given with full consent of parties. His wife is not so averse to removal as formerly. Indeed the difficulty is with himself. You never knew a better, sweeter man, -- of excellent literature, and, except his air and a little roughness of voice, the best preacher imaginable. You could not get a greater blessing among you of that kind. As I have heard nothing from other hands, I want fuller information. Are the people generally hearty for Leechman upon the character they hear? Is there no other worthy man on the field? Unless these points be cleared. He will take no steps. I remember one Millan, an assistant. Pray is he to be continued, and no way affronted or neglected in this design? Leechman is well as he is, and happy, though preaching to a pack of horse-copers and smugglers of the rudest sort. He would do nothing hard or disagreeable to any worthy man, and

has no desire of change. But if the field be clear, it were <peccare in publica commoda> not to force him out of that obscure hole where he is so much lost. He was the man I wished in the first place to be our professor of theology. . . . I have no news but that we expect immediately from Robert Simson a piece of amazing geometry, reinventing two books of Appollonius, and he has a third almost ready. He is the best geometer in the world, reinventing old books, of which Pappius preserves only a general account of the subjects.

<Glasgow, Sept.> 20, 1743. -- I had the favor of yours by Mr. Blow, but could not return an answer by him, being much employed in promoting the affair you wrote about. I had also very urgent letters from Messrs. Mairs and Duchals to the same purpose. `Tis very difficult to persuade a modest worthy man who is tolerably settled, to adventure upon a new scene of affairs among strangers. I shall use my utmost endeavors to prevail upon him as I have been doing for some time past. I am sorry I cannot give you great hopes of success , but I don't yet so despair as to quit solicitation, as he is exceedingly moved with the affection and generosity of that people. My most humble and hearty respects to your brethren of your presbytery, whom I shall always remember with the greatest esteem and affection.

<Glasgow, Feb.> 20, 1743-44 -- am not a little surprised that I have not heard from you these four months past, though there were some of my letters which any other person would have thought required an answer. I could tell you a good deal of news upon the unexpected election of a professor of divinity, and the furious indignation of our zealots; but you deserve no news from anybody. We have our own concern about the settlement in Belfast, but we are to expect no accounts from you of any thing. Pray tell Mrs. Haliday her son is doing very well. . . . I was never more honored than since our late professor's death. Our hearty respects to Mrs. Drennan, and sympathy on the loss of her boys.

Dicimus autem hos quoque felices qui ferre incommoda
vtae Nec jactare jugum vita dedicere magistra

<Glasgow, April> 16, 1746. -- Our public news of the 15th from Edinburgh was, that the duke had passed the Spey, that 2,000 rebels on the banks fled precipitately upon his pointing his cannon at them. They may reassemble, and, as they are very cunning, may have some artifice to surprise; but I cannot but hope they are dispersing, and their chiefs making their escape. You have heard no doubt of our taking from them the " Hazard " sloop they had taken at Montrose. She returned from France with 150 men and arms and ammunition, and had landed them; but Lord Rea very boldly attacked them with a smaller number, and took {467} them all prisoners with 13,000L sterling. The same man-of-war took another of their ships, with arms and ammunitions, which had seized twelve small merchant. men in Orkneys for their use. The duke has endeared himself to some of his very enemies by his good sense and humanity, void of all state or pride.

I had this day a letter from a presbytery of

Pennsylvania, of a very good turn, regretting their want of proper ministers and books, expecting some assistance here; it was of a very old date of October last. I shall speak to some wise men here, but would as soon speak to the Roman conclave as our presbytery. The Pennsylvanians regret the want of true literature; that Whitfield has promoted a contempt of it among his followers, and bewailing some wretched contentions among themselves. The only help to be expected from you is sending some wise men if possible. I shall send them my best advice about books and philosophy, and hope to be employed to buy them books cheaper here than they are to be got anywhere. I long for a. fuller letter about all your chat and news. I am in a great deal of private distresses about Jo Wilson and his sister, -- the latter in the utmost danger, the other scarce recovered from death, my wife too very tender; but by a set of most intricate business, upon which the soul of this college depends, and all may be ruined by the want of one vote, I cannot leave this till after the 26th of June, and we go to Dublin first.

ART. II. <Questions proposed in the Philosophical Society in Aberdeen> (<see p.> 227).

1. President. -- Whether the greatest part of the matter that composes the bodies of vegetables and animals is not air or some substance that is mixed with the air and floats in it Handled, Feb. 8.

2. Dr. Skene.-What are the proper characters of enthusiasm and superstition, and their natural effects upon the human mind? Handled, Jan. 25.

3. Mr. Trail. -- What are the proper methods of determining the sun's parallax by the transit of Venus over his disk in 1761? Handled, April 12.

4 Mr. Campbell. -- What is the cause of that pleasure we have from representations or objects which excite pity or other painful feelings? Handled, Feb. 8.

5. What is the true cause of the ascent, suspension, and fall of vapors in the atmosphere? Mr. Stewart. Handled, Feb. 22.

6. Mr. Reid. -- Whether some part of that food of plants which is contained in the air is not absorbed by the earth, and in the form a watery fluid conveyed into the vessels of plants. And whether any thing can enter into the vessels of plants that is not perfectly soluble in water. Handled, March 8.

7 President. -- Is there a standard of taste in the fine arts and in polite writing; and how is that standard to be ascertained? Handled, March 22, and May to.

8. Dr. Skene. -- How far human actions are free or necessary. Handled, May 24, and June 14.

9. How far the motion of the earth and of light accounts for the aberration of the fixed stars. Mr. Trail. Handled, April 12.

10. Mr. Campbell. -- Can the generation of worms in the bodies of animals be accounted for on the common principles of generation. Handled, June 28 {468}

11. Is the human soul confined to any part of the human body; and, if so, to what part? Mr. Stewart. Handled, June 28.

12. Mr. Reid. -- Are the objects of the human mind properly divided into impressions and ideas? And must every idea be a copy of a preceding impression. Handled, July 13 and 26.

Jan. 25, no questions.

Feb. 8, 22. March 8, none.

13. [March 22, 1758.] Mr. Gordon. -- What is the origin of polytheism? Handled, Aug. 10.

14. [March 22, 1758.] Mr. Gerard. -- What are the proper subjects of demonstrative reasoning? Handled, Aug. 23, and Sept. 13

15. [April 12.] Mr. Farquhar. -- Upon what the characters of men chiefly depend? Nov. 15

16. [April 12.] What is the apparent figure of the heavens, and what are the causes of it? Humanist, Nov. 15

17. [April 12.] Whether justice be a natural or artificial virtue. Nov. 22.

April 22.

18. [April 22] Mr. Farquhar. -- In the perfection of what faculty does genius consist? Or if in a combination of faculties what are they? Superseded, because the subject of Mr. Gerard's discourses.

19. What are the parts of the body so connected with the several faculties of the mind that the destruction of those parts brings on a destruction of the exercise of those faculties. Dec. 13.

20. Dr. Gregorie. -- What are the plants that enrich a soil and what are those that impoverish it, and what are the causes of their enriching it, and impoverishing it? Feb.11, 1759

21. Dr. Skene. -- Wherein does happiness consist? March 28.

22. Whether the ideas of mixed modes are to be considered as the mere creatures of the mind, or are formed after patterns, as well as the ideas of the substances whereof they are modes. Mr. Trail, Feb.11, 1759.

23. Mr. Campbell. -- Whether matter has a separate and permanent existence. [previous sentence crossed out] The nature of contrariety. May 30.

24. Mr. Stewart. -- Whether the sense of hearing may not be asserted by act, in like manner as that of seeing is by optical glasses. April it.

25. Mr. Reid. -- Whether mankind with regard to morals always was and is the same. June 12.

26. In what cases and for what causes is lime a proper manure? Mr. Thos. Gordon. July 24, and Aug. 14

27. Mr. Gerard. -- What is the origin of civil government? June 26.

28. Mr. Farquhar. -- What is the foundation of moral obligation? Sept. 26.

29. Mr. Ross. -- How can it be accounted for that an inflammable spirit is obtained from regenerated tartar (vinegar saturated with chalk or saccharum saturne by distillation)? Or how comes it about that vinegar is restored to the state of an ardent spirit by being distilled with fixed alkali, chalk, or lead? Oct. 16, 1759

30. Dr. Gregorie.-Whether the Socratic method of instruction or that of prelection is preferable. Jan. 8, 1760.

31. How far the ancient method of education in public seminaries from earliest infancy was preferable or inferior

to the modern practice. By Dr. Skene, NOV. 27, 1759

32. Mr. Trail. -- What is the Agrian law which will conduce most to the populousness of a nation? Or what is the maximum of estates fittest for that purpose? {469}

33. Whether education in public schools or by private tutors be preferable. Principal Campbell, Dec. ", 1759, and Feb. 26, 1760.

34. Mr. Stewart. -- Whether the time allotted for teaching Greek in the universities of Scotland be not too short, and, if so, what would be the proper remedy. Feb. 26, 1760.

35. Mr. Reid. -- Whether it is proper to educate children without instilling principles into them of any kind whatsoever. April 1, 1760.

36. Mr. Gordon. -- Whether there be not, in the very nature of our reaching societies, a tendency to stop farther advancement in those branches of learning which they profess. And, if it is so, what is the best remedy. June 24, and July 9, 1760.

37. Prof. Gerard. -- In what manner the general course of education may be conducted so as it may answer best as a preparation for the different businesses of life. Aug. 12, 1760.

38. What is the best method for training to the practice of virtue? Mr. Farquhar. Dec. 9, 1760.

39. What are the natural consequences of high national debt; and whether, upon the whole, it be a benefit to a nation or not? Dr. Gregorie. Jan. 13, 1761.

40. Whether paper credit be beneficial to a nation or not. Dr. Skene, Feb. 24.

41. What is the cause of the apparent color of the heavens? Or what is properly the object to which that color can be attributed? Principal Campbell, March to.

42. Whether the idea of cause and effect include in it any thing more than their constant conjunction. And, if so, what it is that it includes. Prof. Stew. art. March 10th and 31st

43. Mr. Trail. -- Whether the substituting of machines instead of men's labor, in order to lessen the expense of labor, contributes to the populousness of a country. Feb. 24

44. Mr. Reid. -- Whether moral character consists in affections, wherein the will is not concerned; or in fixed habitual and constant purposes. April 15.

45. Mr. Gordon.-Whether slavery be in all cases inconsistent with good government. NOV. 24

46. Mr. Gerard. -- Whether there be any such affection in human nature as universal benevolence. Dec. 8.

47. Mr. Farquhar.-Whether in writing history it be proper to mix moral and political reflexions or to draw characters. Dec. 8.

48. Whence does man derive the authority which he assumes over the brutes, and how far does this authority extend? Mr. Beattie. Dec. 22, 1761.

49. What are the best expedients for preventing an extravagant rise of servants' wages, and for obliging them to bestow their labor where agriculture and manufactures require it. Jan. 12, 1762. Occasional question.

50. Doctor Gregorie. -- What are the good and bad effects of the provision for the poor by poor's rates, infirmaries, hospitals, and the like? Feb. 9.

51. Doctor Skene. -- Whether the determination by

unanimity or a majority injuries is most equitable. March 9.

52. Doctor Campbell. -- How far human laws can justly make alterations on what seems to be founded on the principles of the law of nature. March 23.

53, Mr. Stewart.-Whether human laws be binding on the consciences of men. April 16.

54. Mr. Reid. -- Whether by the encouragement of proper laws the number of births in Great Britain might not be nearly doubled or at least greatly increased. June 8. {470}

55. Mr. Thomas Gordon. -- Whether the current coin of the nation ought not to be debased by alloy or raised in its value, so as there shall be no profit made by exporting it. Dec. 14.

56. Doctor Gerard. -- Whether it be best that courts of law and courts of equity were different, or that the same court had the power of determining either according to law or equity as circumstances require. Feb. 22, 1763.

57. Mr. Farquhar -- Whether justice is most effectually promoted in civil and criminal courts where the judges are numerous or where they are few. March 22.

58. Mr. Beattie. -- What are the advantages and disadvantages of an extensive commerce? March 22.

59. Dr. Gregory. -- Whether the art of medicine, as it has been practised, has contributed to the advantage of mankind. July 12.

60. Dr. Skene. -- Whether in the same person opposite passions and affections, such as love and hatred, resentment of injuries and benefits, always subsist in an equal degree of strength. Oct. to.

61. Dr. Campbell. -- Whether any animals besides men and domestic animals are liable to diseases, the decay of nature and accidental hurts excepted; and if they are not, whether there is any thing in the domestic life which can account for such diseases as men and domestic animals are obnoxious to. May to.

62. Mr. Stewart. -- Whether or not there be a real foundation for the distinction betwixt precepts or counsels in matters of morality. Dec.-- 13

63. Dr. Reid. -- Whether every action deserving moral approbation must be done from a persuasion of its being morally good. NOV. 22, 1763.

64. Mr. Thomas Gordon. -- How far the profession of a soldier of fortune is defensible <in foro conscientiae>. Jan. 24, 1764.

65. Dr. Gerard. -- Whether eloquence be useful or pernicious. Feb. 28, 1764

66. Mr. Farquhar.-What is the origin of the blacks? March 13, 1764.

67. Mr. Beattie. -- What is that quality in objects that makes them provoke laughter? March 27

68. Dr. George Skene. -- Whether are men become degenerate in point of size and strength, or has the modern method of living increased the number of diseases or altered their nature? April 9.

69. Mr. William Ogilvy. -- Whether curiosity be not the most powerful motive to study in the mind of youth and that which acts most uniformly. NOV. 27

70. Dr. Gregory. -- What are the distinguishing characteristics of wit and humor? May 8.

72. Dr. Campbell. -- Whether the manner of living of parents affects the genius or intellectual abilities of the children Jan. 22, 1765

73. Mr. Stuart. -- Whether the idea of an infinitely perfect Being be a good argument for his existence. June 11, 1765.

74. Dr. Reid. -- Wherein does the nature of a promise consist, and whence does its obligation arise? March 12, 1765

75. Mr. Thomas Gordon. -- Whether there is any degeneracy of genius in the moderns. March 26, 1765.

76. Dr. Gerard. -- Whether children do not take more after the mother than the father, and if they do, what are the causes of it? Aug. 13, 1765.

77. Mr. Farquhar. -- Whether would the end of religion be most effectually promoted by a regular civil establishment for the support of the clergy, or by leaving their support to the voluntary contributions of the people? Nov. 12 {471}

78. What is the difference between common sense and reason? Dec. 10, 1765

79 Dr. George Skene. -- Is light a body whose particles are thrown off with great velocity from the luminous body, or is it a tremulous motion excited and propagated through a subtle medium analogous to the tremors of flies which occasion sound? Dec. 9, 1766.

80. Mr. William Ogilvie. -- Suppose a legislator were to form an establishment of clergy, on what principles ought he to proceed in order to render it most effectual for promoting religion and morality without favoring superstition? Nov. ", 1766.

81. Mr. Dunbar. -- Whether the considerations of good policy may not some. times justify the laying of a restraint upon population in a state.

82. Dr. David Skene. -- What are the advantages which mankind peculiarly derive from the use of speech? March 13, 1766.

83. Dr. Campbel. -- Whether it is possible that the language of any people should continue invariably the same, and if not, from what causes the variations arise. Oct. 13, 1766.

84. Mr. Thomas Gordon.-Whether in science it ought to be an aim to in. crease or to diminish the number of first principles. June 10, 1766.

85. Dr. Gerard. -- Whether any form of government can be perpetual. Dec. 9, 1766

86. Mr. Farquhar. -- Whether the observation of the unities of time and place are essentially requisite to the perfection of dramatic performances. Jan. 27, 1767.

87. Mr. Beattie. -- Whether the different opinions and different practices which prevail in different nations be an objection to the universality of the virtuous sentiment. Feb. 24, 1767.

88. Dr. George Skene.-Whether the opportunities of acquiring a learned
education may not be too much in the power of the commonalty either for the advancement of learning or the good of the state.

89. Mr. Ogilvy.-I low does it appear to be equitable that the subjects of the state should be taxed in proportion to their respective fortunes and not equally over head or by

any other rule? March 24, 1767.

90. Mr. Trail. -- In what sense may virtue be said to consist in acting agree. ably to nature, and vice in deviating from it?

91. Dr. David Skene.-- If mankind are considered in respect of rank and fortune, in what class may we expect to find the virtuous principle most prevalent? June 9, 1767

92. Dr. Campbel. -- Whether the Greek language remained invariably the same so long as is commonly thought, and to what causes the duration which it had ought to be ascribed. Nov. 10, 1767.

93. Mr. Gordon. -- What is the province and use of metaphysics? Dec. 8, 1767

94. Dr. Gerard. -- Whether poetry can be justly reckoned an imitative art; and, if it can, in what respects? Jan. 26, 1768.

95. Mr. Farquhar. -- Whether the maintaining an esoteric and exoteric doctrine, as was practised by the ancients, is reconcilable to the principles of virtue.

96. Mr. Beattie. -- Whether that superiority of understanding by which the inhabitants of Europe and of the countries immediately adjoining imagine them. selves to be distinguished may not easily be accounted for without supposing the rest of mankind of an inferior species. {472}

97. Dr. George Skene. -- Whether the aim of a public teacher ought to be to adapt his instructions to the capacities of the duller part of his audience or to forward the ingenious.

98. Mr. Ogilvie. -- What is that in the manners of any nation which exhibits it justly to the appellations of civilized or barbarous?

99. Mr. Dunbar.-What are the characteristics of polished language? and how is the comparative excellency of different languages to be estimated?

too. Mr. Trail. -- How far may the inequalities of astronomical refraction be remedied by the thermometer and barometer?

101. Dr. David Skene. -- Whether the late proceedings with respect to a favorite of the mob be an evidence of the corruption or of the improvement of our constitution.

102. Principal Campbel. -- What is the proper notion of civil liberty? Oct. 24, 1769

103. Mr. Gordon. -- How far the facts relating to the burning of the Roman ships in the harbor of Syracuse be reconcilable to the laws of reflection and refraction of light. Nov. 1769.

104. Dr. Gerard. -- Whether any account can be given of the causes why great geniuses have arisen at the periods which have been most remarkable for them, and why they have frequently arisen in clusters. Dec. 12, 1769.

105. Mr. Beattie. -- Whether the use of translations can ever supersede the necessity o' studying the Greek and Roman authors in the original languages. May 8, 1770

106. Dr. George Skene. -- What is the difference between pressure and momentum; and how are they to I>e compared? NOV. 27, 1770.

107. Mr. Ogilvy. -- Whether there may be any reason to believe that the friendships of this life may continue after death.

108. Mr. Dunbar.-Whether the increasing the number of

British peers tends to enlarge or diminish the power of the crown. March 27, 1770

109. Mr. Trail. -- What are the <desideraia> in mathematics? June 12, 1770,

110. Occasional question proposed by Mr. Beattie. -- Whether it be not for the advantage of mankind as moral beings that the evidence of a future state is rather a high probability than an absolute certainty. Oct.-- 9, 1769.

111. Dr. David Skene. -- What are the advantages and disadvantages arising from the different arrangements of words which obtain in the antient and modern languages?

112. Principal Campbel. -- What is the best method of teaching a foreign or dead language?

113. Mr. Gordon. -- How are <vis inertae> and weight to be distinguished, and in what do they agree?

114. Dr. Gerard. -- Whether national characters depend upon physical or moral causes, or whether they are influenced by both. Feb. 26, 1771

115. Mr. Beattie. -- Does it imply any absurdity or any thing inconsistent with the divine perfections to suppose that evil, both physical and moral, must be permitted to take place in a state of moral probation? March 26, 1771.

116. Dr. George Skene.

117. Mr. Ogilvy. -- Is there any injustice done to an impressed man, when he is punished according to the articles of war? March 12, 1771

118. Mr. Dunbar.-- How are the proceedings of instinct to be distinguished from reason or sagacity in animals? Feb. II, 1772.

119. Mr. Trail. -- What is the cause of the color of the heavenly bodies P Feb. 25, 1772 {473}

111 [sic]. Dr. Campbel.-- What are the advantages and disadvantages arising from the different arrangements of words which obtain in the ancient and modern languages?

120. Mr. Gordon. -- How far is an expensive taste of living connected with corruption of manners and the ruin of a nation?

121. Dr. Gerard. -- What are the ways in which watering operates in improving land? March 24, 1772.

122. Dr. Beattie. -- How far is versification essential to poetry?

123. Dr. George Skene.

124. Mr. Ogilvy. -- By what circumstances has slavery been so moderated as to become supportable to so many nations of mankind?

125. Dr. Dunbar.

126. Mr. Trail. -- Does Dr. Halley's theory of evaporation sufficiently account for the constant influx into the Mediterranean at the Straits of Gibraltar?

ART. III. MSS. <Papers by Dr. Reid, text me by Francis Edmund, Esq., Aberdeen> (<see pp.> 192, 223.)

I. <Some Observations on the modern System of Materialism>. This paper is in no fewer than five forms, showing what pains he took with it. One or two of the forms were notes or preparations, the other three fully written out as if to be read before a society.

By the modern system of materialism he means that advanced by Dr. Priestley in his " Disquisitions relating to Matter and Spirit," 1777, and " Free Discussion of the Doctrines of Materialism and Philosophical Necessity," 1777. The paper is of a thorough and searching character, distinguished for acuteness beyond almost any of the published writings of Reid, and written with great point and naivete. It looks as if designed for publication. Chap. 1. <Of the Connection of this System with other philosophical Opinions>. Here he describes the views entertained of substance by eminent men, criticising ably the defective views of Locke. Chap. II. <Of Newton's Rules of philosophizing>, showing that he had profoundly studied Newton. He gives fair explanations of Newton's rules. He shows that Priestley does not follow these rules. Chap. III. <Of the Solidity or Impenetrability of Matter>, showing there is an ambiguity in the meaning of the word solidity, and that Priestley has not succeeded in showing that matter is not solid or impenetrable. Chap. IV. <Of the Inertia of Matter>, showing that Priestley does not follow Newton. The whole is the result of much reading and reflection. ".

II <Miscellaneous Reflections on Priestley's account of Hartley's Theory of Me Human Mind>. He shows that Hartley's views were unfounded hypotheses, but speaks with great fondness and respect of Hartley. He is very severe upon Priestley's employment of Hartley's theories, particularly upon his attempt to explain every mental faculty by association. He refers to Aristotle's views of association. He shows that association cannot account for memory, which was explained by the vividness of the ideas. " Every man knows what memory is, and every man knows what is meant by vividness of ideas or conceptions, and their power of suggesting one another; and when we know and understand what each of these things is we can be at no loss to know whether they are one and the same. Let every man judge for himself whether memory is a certain degree {474} of vividness in ideas, and of a certain degree of strength in their power of suggesting one another. To me they appear to be things quite of a different nature; and I could as easily believe that a hat is a pair of shoes as that memory is a certain degree of vividness in ideas and of strength in their association." "A malefactor that is going to be hanged has a cluster of very vivid ideas, and very strongly associated, of what he is about to suffer, but it is not the object of remembrance but of foresight;" or, "It appears evident, therefore, that something more than association of ideas is required to produce memory, and consequently that association is not of itself sufficient to explain or account for memory." He shows that association cannot account for judgment; "for if there is a power in the mind of comparing ideas and of perceiving certain relations between them, such as those of universal concurrence and perfect coincidence, this power is not that of association; for it is evident that ideas may be associated with any degree of strength without being compared, without perception of any relation between them." He shows in much the same way that association cannot account for the passions and volition. He shows in the same paper that Priestley's attempt to get Locke's ideas of reflection from sensation utterly fails. Priestley had said,

"got by abstraction." "We would be glad to be informed by Dr. Priestley whether a man, when he thinks, is not conscious of his thoughts? Whether he has not the power of reflecting upon his own thoughts and making them an object of thought," &c.

III. <On Liberty or Necessity>. "The liberty of the will is a phrase similar to that of the liberty of speech. The last signifies not a power inherent in speech, but a power in the man to speak this or that. In like manner, the liberty of the will signifies not a power inherent in the will, but a power in man to will this or that." "This power is given by his Maker; and, at his pleasure whose gift it is, it may be enlarged or diminished, continued or withdrawn. No power in the creature can be independent of the Creator. The hook is in its nose; he can give it line as far as he sees fit, and when he pleases can restrain it or turn it whither soever he will. Let this be always understood when we ascribe liberty to man or to any created being. Supposing it therefore to be true that man is a free agent, it may be true at the same time that his liberty may be impugned or lost by disorder of body or of mind, as in melancholy or in madness; it may be impaired or lost by vicious habits; it may in particular cases be restrained by divine interposition." He explains cause and effect, native and active power, liberty and necessity, standing up for efficient cause. In a fragmentary paper upon the same subject, perhaps a continuation: "I grant that all rational beings are influenced and ought to be influenced by motives. But the relation between a motive and the action is of a very different nature from the relation between an efficient cause and its effect. An efficient cause must be a being that exists and has power to produce the effect. A motive is not a thing that exists. It is only a thing conceived in the mind of the agent, and is what the schoolmen called an ens rationis, and therefore cannot possibly be the efficient cause of any thing. It may influence to action, but it cannot act. It is like advice or persuasion, which may have an influence of the same kind with that of motives; but they leave the man still at liberty and indeed suppose liberty. For in vain is advice given if the person be not at liberty either to follow or reject it. In like manner, motives suppose liberty in the agent, otherwise they have no influence at all."

IV. <Of Constitution>. Apparently a very old paper, not written with care for the press. "Everything that is made must have some constitution, -- some fabric, make, or nature,-from Which all its qualities, appearances' powers, and operations do result" "It is one thing to say such a truth depends upon my constitution; {475}it is another thing to say that my perception of that truth depends on my constitution, and these two things ought most carefully to be distinguished." "My perception of every self-evident truth depends upon my constitution, and is the immediate effect of my constitution, and of that truth being presented to my mind. As soon as this truth is understood that two and two make four, I immediately assent to it, because God has given me the faculty of discerning immediately its truth, and if I had not this faculty I would not perceive this truth; but it would be a true proposition still, although I

did not perceive its truth. The truth itself therefore does not depend upon my constitution, for it was a truth before I had an existence, and will be a truth, although I were annihilate; but my perception of it evidently depends upon my constitution, and particularly upon my having as a part of my constitution that faculty (whether you call it reason or common sense) by which I perceive or discover this truth." "If it should farther be inquired how far the truth of self-evident propositions depends on the constitution of the being that perceives them, the answer to this question is no less easy and obvious. As every truth expresses some attribute of a thing, or some relation between two or more things, the truth depends on the nature of the thing whose attribute is expressed. The truth of this proposition, that a lion is a ravenous beast, depends upon the constitution of a lion, and upon nothing else. The truth of this proposition, that the sun is greater than the moon, depends upon the magnitude of the sun and moon, and upon nothing else." In like manner as to right and wrong. " Although the rectitude or depravity has a real existence in the agent in this case, yet it cannot be discerned by a spectator who has not the faculty of discerning objects of this kind." " Why do I believe first principles?" "One philosopher says, Because I am so constituted that I must believe them. This, say some, is the only possible reason that can be given for the belief of first principles. But, say others, this is a very bad reason; it makes truth a vague thing which depends on constitution. Is not this the ancient sceptical system of Heraclitus, that man is the measure of truth, that what is true to one man may be false to another? How shall we judge of this controversy? Answer, This question admits of two meanings. 1. For what reason do you believe first principles? 2. To what cause is your belief of first principles to be ascribed?" "To first, evidence is the sole and ultimate ground of belief, and self-evidence is the strongest possible ground of belief, and he who desires a reason for believing what is self-evident knows not what he means." To the second the answer is not so satisfactory. It is "that belief is a simple and original operation of the mind which always accompanies a thing we call evidence." "If it should be asked, what this evidence is which so imperiously commands belief, I confess I cannot define it." "If it should farther be asked, what is the cause of our perceiving evidence in first principles, to this I can give no other answer but that God has given us the faculty of judgment or common sense.' The paper closes thus: "Q. Is there not a difference between the evidence of some first principles and others? A. There are various differences perhaps. This seems to be one, that, in some first principles, the predicate of the proposition is evidently contained in the subject: it is in this, two and three are equal to five; a man has flesh and blood. In these and the like self-evident principles, the subject includes the predicate in the very notion of it. There are other first principles in which the predicate is not contained in the notion of the subject; as, where we affirm that a-thing which begins to exist must have a cause. Here the beginning of existence and causation are really different notions, nor does the first include the last. Again, when I affirm that the body which I see and feel really exists, existence is not included in the notion of a body. I can have the

{476}notion of it as distinct when it is annihilate. The truth of principles of the first kind is only perceiving some part of the definition of a thing to belong to it, and such propositions are indeed of very little use: they may justly, as Mr. Locke observes, be called trifling propositions. One general maxim may include all first principles of this kind; viz., Whatever is contained in the definition of a thing may be predicated of it. But in reality the definition sufficiently supplies the place of such axioms. That the sides of a square are equal, that all the radii of a circle are equal, these do not deserve the name of axioms; for they are included in the definitions of a square and of a circle. Of the same kind are these propositions that an effect must have a cause, that a son must have a father. There is nothing affirmed in such propositions but what is contained in the definition or in the notion of the terms. There are other first principles wherein the predicate is not contained in the definition or notion of the subject. Of this kind is every proposition which affirms the real existence of any thing. Existence is not included in the notion of any thing. I " -- here the paper abruptly closes. The paper is the dimmest and yellowest of all: looks old. Query: when written? The whole paper 11 pages.

V. <On the Axioms of Euclid>. "It seems no man pretends to define sum or difference, or what it is to be greater or less. There are therefore some terms that frequently enter into mathematical reasoning, so simple as not to admit of mathe. matical definition. The mathematical axioms ought to be employed about these and only about these."

VI. <On tlte Muscular Motion in the Human Body>. A paper worthy of constituting a chapter in "Paley's Natural Theology," showing a thorough knowledge of mechanical principles, and of the physiology of his time.

VII. <Some Thoughts on the Utopian System>. In this paper he seems to amuse himself with describing the advantages of a community without private property.

VIII. <An Essay on Quantity>. Royal Society of London, Oct., 1748, and published in works.-" P. S. When this essay was wrote in 1748, 1 knew so little of the history of the controversy about the force of moving bodies, as to think that the British mathematicians only opposed the notion of Leibnitz, and that all the foreign mathematicians adopted it. The fact is, the British and French are of one side; the Germans, Dutch, and Italians of the other. I find likewise that Desaguliers, in the second volume of his course of 'Experimental Philosophy,' published in 1744, is of the opinion that the parties in dispute put different meanings upon the word force, and that in reality both are in the right when well under. stood."

[2]Mr. Buckle, in his "History of Civilization," vol. ii., professes a deep ac quaintance with the Scottish metaphysicians of last Century, who are represented by him as proceeding in the deductive, and not in the inductive, method. He adds, that in Scotland "men have always been deductive." But Mr. B. was never able to understand the difference between the method of deduction on the one hand, and the method of induction with consciousness as the agent of obser vation, on the other: the former derives consequences by reasoning from princi. ples, the latter reaches principles by internal observation. That his whole views on this subject were confused is evident, from the circumstance that he represents women as proceeding (like Scotchmen) by deduction!

[3]See "Considerations on Patronage, by Francis Hutcheson," 1735.

[4]Mr. Buckle is reported to have expressed, in his dying days, bis regret that he could not see moral causes operating in the promotion of civilization. Of course intellectual power must always be the immediate agent in producing civil ization; but did it never occur to Mr. Buckle to ask what stirred up the intellec tual power in a country so unfavorably situated as Scotland? It is all true that steam power is the main agent in producing manufactures in our country; but how contracted would be the vision of one who can see only the steam power, and not the intellectual power which called the steam into operation! Equally narrow is the view of the man who discerns the intellectual power which effected the peculiar civilization of Scotland, but cannot discover the moral power which awoke the intelligence. It should be added, that just as the steam polver, in vented by intellectual skill, may be devoted to very unintellectual uses, so the intelligence aroused by moral or religious causes may be turned (as Scotland shows) to very immoral and irreligious ends.

[5]There is a copy in the Edinburgh University Library.

[6]The reader curious on this subject will find ample information in ixossais en France," by Michel.

[7]Letters to a student at the University.

[8]It was owing, I doubt not, to the influence, direct or indirect, of Shaftesbury that the phrase "common sense" came

to be so much used by the Scottish School.
[9]The intelligent reader will see how much indebted Bishop Butler was to Shaftesbury, for the views propounded in his "Sermons on Human Nature." Shaftesbury, before Butler, had spoken of human nature as a " constitution," and had shown that to live according to nature implies a respect to the conscience. Ife complains of those who speak much of nature, without explaining its meaning ("Wit and Humor," iii.2). He had divided our affections into personal and public and the moral power, and represented that power as a principle of reflection. Butler goes beyond Shaftesbury in showing that our personal affections are nnt in themselves selfish, and that the moral faculty is not only in our soul, but claims supremacy there. Butler declines to say whether the moral faculty is a a sense, or what else; and he will not say that moral good consists in benevolence.
[10]tewart was not "able to discover the date of the first edition," and others have been as unsuccessful. It is criticised in jackson's "Dissertation on Matter and Spirit," 1735, and referred to in " Bibliothque Raisonn6e des ouvrages des Savans," for April, May, and June, 1735. But the question is settled by its appearing (as a friend has shown us) in the " Gentleman's Magazine," in the register of books published October, 1733
[11]"Account of the Life, Writings, and Character of Francis Hutcheson," by William Leechman, D.D., prefixed to Hutcheson's "Moral Philosophy;" Carlyle's "Autobiography;" MSS. Letters from Hutcheson to Dr. Drennan, &c.
[12]Sir James Mackintosh says in his "Dissertation:" "The place of Hutcheson's birth is not mentioned in any account known to me. Ireland may be truly said to be <incuriosa suorum>." Had Sir James made inquiries in the likely quarter, he would have found the place of his birth and the leading incidents of his life mentioned in an article signed "M." in the "Belfast Magazine" (for August, 1813), edited by Dr. Drennan, a man of superior literary ability, and son of the Rev. Thomas Drennan, one of Hutcheson's most intimate friends.
[13]"His father, laboring under a slight rheumatic affection, deputed him to preach in his place on a cold and rainy sabbath. About two hours after Francis had left Ballyrea, the rain abated and the sun shone forth, the day became serene and warm, and Mr. Hutcheson, feeling anxious to collect the opinions of his con. gregatioii on the merits of his favorite son, proceeded directly to the city. But how was he astonished and chagrined when he met almost the whole of his flock coming from the meetingghouse, with strong marks of disappointment and disgust visible in their countenance. One of the elders, a native of Scotland, addressed the surprised and mortified father thus: 'We a' feel muckle wae for your mishap, reverend sit; but it canna be concealed. Your silly loon Frank has fashed a' the congregation wi' his idle cackle; for he has been babbling this oor about a gude and benevolent God, and that the sauls o' the heathens themsels will gang to heeven, if they follow the light of their own consciences. Not a word does the daft boy kl!n, speer, nor say, about the gude auld comfortable doctrine of election, reprobation, original sin, and faith. Hoot, mon, awa' wi' sic a fellow!'" The only members who waited for the end of the sermon were Nir. Johnson of Knappa, Mr. M'Geough, and the clerk. (Stuart's "History of

Armagh.") This story may be made somewhat more pointed in the telling, but is, we have no doubt, substantially correct. It will be remembered that P,.fessor Simson held similar views in regard to the heathen; and, in the Introduction to the Translation of Antoninus by Hutcheson and Moor, the authors maintain: "'Tis but a late doctrine in the Christian church that the grace of God and all divine influences were confined to such as knew the Christian history, and were by profession in the Christian church."
[14]Wodrow's "Analecta."
[15]The valuable letters of Hutcheson have been kindly placed at the disposal of the author of this work by Dr. Drennan, grandson of the Rev. Thomas Dren nan, and have been used in this Memoir.
[16]There is evidently an analogous (not identical) movement going on in Scot land at this present time. There is an understood combination of persons in and beyond the universities, laboring in reviews, in books, and from the pulpits "to put a new face upon theology in Scotland," just as Hutcheson and Lechman did.
[17]MS. letter to Rev. T. Steward, minister at St. Edmundsbury, in possession of Mr. Reid in Londonderry.
[18]There is a curious book, " An Introduction towards an Essay on the Origin of the Passions, in which it is endeavored to be shown how they are all acquired, and that they are no other than Associations of Ideas of our own making, or what we learn of others," London, printer for R. Dodsley, at Tully's Head in Pall Mall, and sold by T. Cooper, at the Globe in Paternoster Row, 1741. It is a mere fragment of thirty-two pages. The author says that the arguments made use of by Locke in order to prove that there are no innate ideas will, I think, hold fully as strong against all implanted appetites, or whatsoever "actions which we style moral or immoral, virtuous or vicious, are approved and disapproved, not by nat ure and constitution, but by habit and association."
[19]There is a work, " An Examination of the Scheme of Morality advanced by Dr. Hutcheson, late Professor of Morality in the University of Glasgow," 1759, in which the author criticises Hutcheson's wholc doctrine of senses, instincts, affections; and objects to his attempts to reduce all virtue and religion to benevolence or goodgwill to others, and also to his doctrine of moral sense as a faculty.
[20]"Memorials of Alexander Moncrieff and James Fisher," by Dr. Young and Dr. Brown.
[21]Parish records of Alloa in Register Office, Edinburga; " Catalogue of Graduates in Edinburgh," edited by Laing (Bannatyne Club); " Presentation Book " of Marischal College, Aberdeen.
[22]In the Preface to his "Moral Philosophy," he refers to a certain poet, " universally confessed to have shown a most extraordinary genius for descriptive poetry in some of his works, and in all of them a heart deeply impregnated with the warmest love of virtue and mankind," as likely from friendship to cast his eye on that Preface; from which we may argue that he had contracted a friendship with James Thomson.
[23]I cannot find that this work was published till 1763, the date of the copy in W. S. Library, Edinburgh. In 1740, he published a translation of " Vertot, Three

Dissertations."
[24]This was Thomas Rundle (born 1686, died 1743). Strong objections were taken to his getting the see of Gloucester, and so he went to Derry, when Thomson writes of him in a poem to the memory of Talbot:

"Though from native sunshine driven,
Driven from your friends, the sunshine of the soul,
By slanderous zeal and politics' infern,
Jealous of worth."

In these times, men were sent to Ireland who would not be tolerated in the Church of England. Pope says of him: " Rundle has a heart and Swift:

"Rundle a bishop, well he may,
He's still a Christian more than they."

He was the author of " Letters to the late Mrs. Barbara Landis," in which he speaks in favor of theatres, gives a high place to reason, says a word in behalf of Chubb, praises Shaftesbury, though he regrets his opposition to Christianity. He says of those who would destroy the foundation of virtue: "That they turn, as the elephants did of old, and trample down those that brought them to the war." The following has, Often been uttered since: "Christianity is so amiable in itself, that what Plato says of virtue is true of it, that if it is beheld in its native charms every man would be in love with it."
[25]See " London Magazine," for that year.
[26]It does seem rather strange that Reid sbould nowhere have acknowledged what he owed to Turnbull.
[27]"Preceptor," vol. ii., 1748; Darling's "Cyclopaedia; " Mackie's " Index Funercgrius; " Kennedy's "Annals of Aberdeen."
[28]"Scottish Register," January, February, March, 1794.
[29]"Scot'S Magazine," August, 1841; Somerville's "Life and Times."
[30]"Scot's Magazine," 1747, 1749; Chambers's "Biographical Dictionary."
[31]The representative book of the age then passing away was " Natural Religion insufficient, and Revealed Necessary to Man's Happiness in his Present State " by the late Rev. Thomas Halyburton, professor of divinity in the University of St. Andrews (born 1674, died 1712). It is a clearly written, respectably learned work, and establishes its point. It was superseded by the deeper discussions raised by Hume. ("Life and Writings," by Burns.)
[32]The author of this work has been aided in his researches on this subject by the great kindness of the Rev. Alexander Christison, clerk to the Presbytery of Chirnside.
[33]"My own Life," by David Hume; "Life and Correspondence of David Hume," by John Hill Burton, &c.
[34]For some years past it has been well known in literary circles in Edinburgh, that there was a scandal about David Hume in his younger years. Having been kindly allowed to look into the ecclesiastical records which bear upon it, I find that there was a charge brought, but no evidence to support it. A woman did, March 5, 1734, charge "Mr. David Home, brother to Ninewells, as being the father of her child." But this woman had previously had three illegitimate children; she had refused to say who was the father of her child when David Hume was in the country, though it was known he was leaving, and she brought the charge after he was gone. The Presbytery of Chirnside, when the case was

brought before them, rebuked the woman for her conduct, and there is no other record of the matter. It is a curious circumstance that this incident should have happened at the time when the youth was leaving his home in so singular a frame of mind.

[35]"Memoirs of R. and J. A. Haldane," chap. xxv.

[36]J.S. Mill labors to derive all our ideas and convictions from sensations. He is to be met by showing that we never have a sensation without knowing a self as sentient.

[37]Mr. Mill is in difficulties at this point, and avows it in a foot-note, P. 174: Our belief in the veracity of memory is evidently ultimate; no reason can be given for it which does not presuppose the belief, and assume it to be Well grounded." The full facts of the recognitive power of memory are not embraced in this brief enunciation, but there is much stated, and more implied; he should have inquired how much is involved, and he would have seen that there is truth admitted fatal to his system. He should also have shown on what ground he proclaims this belief to be "evidently ultimate," and then we might have shown that on the same ground, that is self-evidence, we are entitled to call in the other ultimate beliefs.

[38]J.S. Mill's treatment of space and time is superficial. He brings in time quietly without noticing it, or giving any account of it. He does not see that the idea of it in the concrete is involved in memory; we remember the event as happening <in time past>. He derives our idea of space from that of the time occupied by our muscular sensations: " When we say that there is a space between A and B, we mean that some amount of these muscular sensations must intervene." " Resisting points " are said to be " at different distances from one another, because the series of intervening muscular sensations is longer in some cases than in others " (pp. 228, 229). He thus avowedly makes, p. 227, an "identification" of length in time and length in space " as one; " whereas our consciousness declares them to be as different as it is possible for ideas to be. The hypothesis on which he and Professor Bain build their whole theory of the origin of our idea of extension, viz., the sensations of our muscles, is doubted by some. The conclusion of F.H. Weber, from numerous and careful observations, is: "Of the Voluntary motion of our limbs, we know originally nothing. We do not perceive the motion of our muscles by their own sensations, but attain a knowledge Of them only when perceived by another sense " (see Abbot on " Sight and Touch," P-- 71).

[39]J. S. Mill has made a most unwarrantable application of the laws of association, in accounting for the formation of our higher ideas. He labors to derive all our ideas from sensation through association. But sensations -- say of sounds, smells, colors, and forms, or of pleasure and pain -- can never be any thing else than sensations, -- that is sounds, smells, colors, forms, pleasures or pains, -- and never can of themselves yield such ideas as those of space and time, cause and effect, moral good and moral obligation. But then he gives to association a sort of chemical power, bv which it changes a series of successive or contemporaneous ideas into something different from any of the ideas, just as oxygen and hydrogen by their union form a third substance, water. He is to be met here by showing that the laws of the association are merely the laws of the

succession of our ideas, and they do not generate a new idea. Repeated association may quicken the flow of our ideas, and make several, as it were, coalesce into one, or it may weaken some and intensify others, but it cannot yield a new element. Even on the supposition that there is (which there is not) a chemical power in association to transmute one thing into another, this would be a new and different capacity, not in the sensations and associations, but superinduced upon them. Mr. Mill's professed evolution of our higher ideas out of sensation by association, is a mere jugglery, in which he changes the elements without perceiving it, and overlooks the peculiarities of the com. posites he would explain.

He has been guilty of an equal error in very much overlooking the relations which the mind of man can discover; and, so far as he does notice them, in giving a very inadequate account of them. In this respect he is far behind Hume, who, we have seen, gives a very comprehensive summary of them. So far as Mr. Mill treats of them, he (followed by Professor Bain) seems to give the mind no other power of comparison than that of observing resemblances and differences. Nor is this his worst error. He confounds the judgments of the mind with associations, and thus endeavors, in a plausible but superficial way to account for that conviction of necessity which is appealed to as a test of fundamental truth. " If we find it," he says, "impossible by any trial to separate two ideas, we have all the feeling of necessity the mind is capable of " (P. 264). Now there is here the confounding of two things that are very different, the association of two ideas, so that the one always calls up the other, with the judgment which declares that two things are necessarily related. The letter A suggests the letter B; this is one mental phenomenon: we decide that two plus two makes four, and that it cannot be otherwise; this is an entirely different phenomenon. Now it is this necessity of judgment, and not the invariable association, that is the test of first truths. When we thus show that association cannot produce a new idea, and that judgment, especially necessary jud&nnents, are something different from associations, we deprive Mr. Mill's theory of the plausibility which has so deceived the London critics bred at the English universities, -- where, I may take the liberty of saying, they would be very much the better of instruction in a sound and sober philosophy.
[40]Here again, from like premises, J.S. Mill has arrived at much the same conclusions. Mind, according to him, is "a series of feelings," with "a belief of the permanent possibility of the feelings." He is to be met by showing that in every conscious act we know self as existing; that when we remember, we remember self as in some state; and that, on comparing the former self with the present, we declare them to be the same. This implies more than a mere series of feelings, or a belief (he does not well know what to make of this belief) in possibilities; it implies a self existing and feeling, now and in time past. Again: "Matter may be defined the permanent possibility of sensation." He is to be met here by showing that we apprehend matter as an existence external and extended, and that we cannot get this idea of extension from mere sensations which are not extended. As to the contradiction between the senses and the

reason, which Hume maintains, Mr. Mill makes the reason and senses say the same thing, that we can know nothing whatever of matter except as the " possibility of sensation," and that it "may be but a mode in which the mind repre sents to itself the possible modifications of the Ego" (p. 189), which Ego is but a series of feelings. This conclusion is quite as blank as that reached by Hume.
[41]Mr. Mill has adopted Hume's doctrine of causation with a few modifications. The question is: Has he left to himself or to his followers an argument for the divine existence? He advises the defenders of theism to stick by the argument from design, but does not say that it has convinced himself. The advice is a sound one; we should not give up the argument from design because of the objections of Kant, which derive their force from the errors of his philosophy. Mr. Mill says, that we can " find no difficulty in conceiving that in some one Of the many firmaments into which sidereal astronomy now divides the universe, events may succeed one another at random, without any fixed law" (" Logic," b. iii. C. 21). I should like to see an attempt made to construct an argument for the divine existence by those who accept this view. Mr. Mill shows that our belief in the uniformity of nature is the result of experience. But the uniformity of nature is one thing and causation is a different thing. He should be met by showing that we have a necessary conviction that every thing that begins to be has a cause, and that he has utterly failed in deriving this conviction from sensa. tions and associations.
[42]In his "Utilitarianism," Mr. Mill has endeavored to defend the theory from the objections commonly taken to it. But he has utterly failed in his attempt to derive our idea and conviction of moral good from mere sensations and associations of sensation.
[43]"Account of the Life and Writings of Adam Smith," by Dugald Stewart; "Life and Writings of Adam Smith," anonymous, but understood to be by J. R. M'Culloch; " Literary and Characteristical Lives," by William Smellie, &c.
[44]"Memoirs of the Life and Writings of the Hon. Henry Home, of Kames," by Alex. Fraser Tytler, Lord Woodhouselee, 2 vols., 1807.
[45]There appeared " Some late Opinions concerning the Foundation of Morality examined, in a Letter to a Friend," London, 1753. The author says of Home: His merit is great, were it only in stating so clearly the sentiment of duty or moral obligation, and distinguishing it from the sentiment of simple moral obligation." The peculiarity of this sentiment, as expressed by the words "ought" and ,should," our author distinctly explains, and shows how it is "to be distinguished from simple approbation by the sanction of self-condemnation or remorse." He says of Hume, that it is "his error from the beginning to the end to haye overlooked the innate feelings of duty, -- that authority which conscience carries in itself, prescribing certain virtues as a law or rule upon which alone morality can be founded and ascertained." "Mr. Hutcheson led the way, by re solving all the several virtues into benevolence, as our author has done into utility, which, in his scnse of it, is much the same."
[46]It is said that Home has been confuted by "the smart and sensible author of the `Estimate of the Profit and Loss of Religion,' and in the modest and elegant `Delineation of

Morality' (Balfour). Two other authors have distinguished themselves against the particular parts of the scheme; viz., Rev. Mr. Adams, a clergyman of the Church of England, in his answer to the `Essay on Miracles,' and Dr. John Stewart in his very masterly reply to the `Essay of Motion.'"

[47]It is proper to state that in his third edition (1779) Home says, on farther reflection he has modified some of his opinions. He gives up the position that "some of our moral feelings and emotions must be founded on a delusion." He now asserts that the notion we have of being able to act against motives "is suggested by the irregular influence of passion, and that we never have it in our cool moments; consequently it is not a delusion of nature, but of passion only." lie thinks that he thus escapes the position that virtue in any measure; rests on the foundation of any natural feelings being a delusion. But, in avoiding one difficulty, he only falls into another; for it is in our moments of cool reflection that we adhere most resolutely to the conviction that we have an essential freedom.

[48]MS. " Life of Witherspoon," by Ashbel Green (formerly President of Princeton College), in the Library of the New Jersey Historical Society MS. "Life of Witherspoon." in a History of the College, by Ex-President Maclean, who has kindly allowed me to use it. " Funeral Sermon," by Rev. Dr. Rodgers, of New York, in edition of Witherspoon's " Works," Philadelphia, 1800.

[49]The genealogy seems to have been:-John Knox; Mrs. Welch; her daughter married to Mr. Witherspoon; Rev. James Witherspoon, their son: Rev. John Witherspsoon.

[50]"Princeton College during the Eighteenth Century " by Samuel D. Alexander.

[51]Stanhope Smith's " Lectures on Moral and Political Philosophy." Stanhope Smith was the author of an "Essay on the Causes of the Variety of Complexion and Figure of the Human Species." He holds by the unity of the race, and accounts for the diversities by natural causes. It was first published, 1787, and ran through several editions.

[52]I may mention, as belonging to the same age, "An Essay on Virtue and Harmony, wherein a Reconciliation of the Various Accounts of Moral Obligation is attempted," by William Jameson, M.A. minister of Rerick, 1749. He shows that man is endowed with various senses, but especially with a moral sense; and, "as several parts or strains uf music and different musical instruments do compose a concert, so the various sorts of beauty, order, proportion, and harmony in the vegetable kingdom, in the animal, and in the intellectual system, constitute one universal harmony or concert: in that grand concert, every man is bound to perform his part in a proper key, as it were, or in just consonance with the whole which can only be done by the order and harmony of his affections, and the beauty and regularity of his actions." The scepticism of Hume cast aside these inquiries into senses and tastes, and led to the profounder philosophy of Reid.

[53]"Account of the Life and Writings of Thomas Reid," by Dugald Stewart; "The Works of Thomas Reid," by Sir William Hamilton; MS. letters in possession of the late Alexander Thomson of Banchory (used by Hamilton); Papers of Dr. Reid in possession of Francis Edmond of Aberdeen.

[54]One version is, that Tillotson had preached from Clarke, and that, in conse. quence, one of Clarke's sermons had been

published among Tillotson's sermons, and that Reid had taken the sermon from Clirke, while the lady had read it in Tillotson. I have not found any confirmation of this.

[55]In possession of Francis Edmond.

[56]MS. notes furnished me by Thomson of Banchory.

[57]MS. letters possessed by Thomson of Banchory.

[58]MS. papers of Dr. Reid, in possession of Francis Edmond, Esq.

[59]Life of Dr. McKinlay of Kilmarnock, prefixed to a volume of his " Sermons."

[60]MS. papers in possession of Francis Edmond.

[61]"An Examination of Dr. Reid's 'Inquiry into the Human Mind, on the Principles of Common Sense,' Dr. Beattie's `Essay on the Nature and Immutability of Truth,' and Dr. Oswald's `Appeal to Common Sense in Behalf of Religion,"' by Joseph Priestley, 1774. Reid's work appears to him "an ingenious piece of sophistry." He wonders that none of the Scottish writers (except Beattie) refer to Hartley. " Something was done in this field by Descartes, very much by Mr. Locke, but most of all by Dr. Hartley, who has thrown more useful light on the theory of the mind than Newton did upon the theory of the natural world." " The evidence that any two properties are necessarily united is the constant observation of their union." Propositions and reasoning " are in fact nothing more than cases of association of ideas." "There are many opinions which we know to be acquired, and even founded on prejudice and mistake, which, however, the fullest correction that they are void of all real foundation cannot erase from the mind; the groundless belief and expectation founded upon it being so closely connected with the idea of certain circumstances, that no mental power of which we are possessed can separate them: "and he gives, as an example, our fear of ghosts. We see the commencement of the feud which culminated in John Stuart Mill's "Examination of Hamilton's Philosophy." But Priestley, like Mill, is obliged, unconsciously and surreptitiously, to call in first truths. " No man ever denied that there are self-evident truths, and that these must be assumed as the foundation of all our reasoning." " I never met with any person who did not acknowledge this." It is curious to find him saying that they "recommend particular positions as axioms, not as being founded on the perception of the agreement or disagreement of any ideas, which is the great doctrine of Mr. Locke, and which makes truth depend upon the necessary nature of things, to be <absolutely unchangeable and everlasting>; but merely some unaccountable instinctive persuasions depending on the arbitrary constitution of our natures."

[62]The translator of Buffier (1780) charges Reid with plagiarism. Dugald Stewart defends him (" Elements," vol. ii., pp. 63, 64); as does also Hamilton (Reid's "Collected Works," P-- 789), who shows that Reid "only became acquainted with the treatise of Buffier after the publication of his own `Inquiry; ' for in his 'Account of Aristotle's Logic,' written and published some ten years subsequently to that work, he says, 'I have lately met with a very judicious treatise, written by Father Buffier.' "

[63]In " Scot's Magazine," February, 1847, was advertised "The Impartial Philosopher, or the Philosophy of Common Sense," by the Marquis d'Argens, in two volumes, 6s.

[64]In possession of Francis Edmond

[65]Original minutes of the Society, kindly lent me by Francis Edmond; " Biographical Sketch of David Skene, M.D," by Alexander Thomson of Banchory.
[66]"An Account of the Life and Writings of Dr. Beattie," by Sir William Forbes.
[67]This portrait was lately in possession of the Misses Glennie, his grandnieces, in Aberdeen. A print of it is to be found in a few copies of Forbes' "Life of Beattie. "
[68]The father published "Miscellanies," by James Hay Beattie, A.M.. in two volumes, 1799. There are some verses worth preserving:

"And how Milton has glands in his brain
That secreted the 'Paradise lost."'

[69]Life, by Rev. Dr. Keith. MS. Papers in possession of Andrew Farquharson of Whitehouse, kindly lent me.
[70]This may be the most appropriate place for referring to Ogilvie's " Philosophical and Critical Observations on the Nature, Character, and Various Species of Composition," 1774. The author was born 1737, became minister of Midmar in Aberdeenshire, and died in 1814. He was a miscellaneous writer in poetry and prose. In " The Theology of Plato compared with the Principles of Oriental and Grecian Philosophy," he treats of topics not usually discussed by the Scottish metaphysicians.
[71]Article, James Burnett, in the "Edinburgh Encyclopedia."
[72]This letter is in possession of the family at Monboddo.
[73]Biographical Sketch of Adam Ferguson, LLD., F.R.S.E., Professor of Moral Philosophy in the University of Edinburgh, by John Small, M.A., Librarian to the university. Read before the Philosophical Society of Edinburgh, April 18, 1864.
[74]Life, by Lord Woodhouselee, prefixed to his " Works " in four volumes; " Literary and Characteristical Lives," by William Smellie.
[75]Not a few of the Edinburgh lawyers wrote philosophical treatises. Thus, "Essays, Moral and Divine," by Sir William Anstruther, of Ailstruther, one of the Senators of the College of justice, 1701. He treats of atheism. providence, learing and religion, trifling studies, stage-plays and romances, incarlation, Jesus Christ, and redemption of mankind. He opposes Locke with some ability, and shows that the idea of a Perfect Being is simple and innate, imprinted on our minds by God in our creation. Then in Sir George Mackenzie's (the bloody Mackenzie) "Works," two vols. folio, 1716, we have an essay on happiness. He shows that nothing without us, not even philosophy, can make us happy, that religion alone can do so. He treats of atheism, of moral gallantry, of the moral history of frugality. He begins with an address to fanatics. He would act the religious stoic, and holds that solitude is to be preferred to public employment. We have also, "Some Thoughts concerning Religion, Natural and Revealed, with Reflections on the Sources of Incredulity with regard to Religion," by Rt. Hon. Duncan Forbes, of Culloden, 1750
[76]Having, in my boyish days, often "kissed the cup to pass it by," among those who had drunk and been drunk with Burns, I am prepared to believe this: but I have to add, that though the sense and humor were strong and shrewd they were often coarse and sensual. Burns was reared in an age in which the uncompromising religion of the covenant was giving way, in the south-west of Scotland, to the milder religion

or irreligion of the moderate type. He owed much to the sincere devoutness of his father; but, in spite of all that the literary admirers of Burns may say to the contrary, I am not sure that it was for the benefit of the son that the father, brought up in the more latitudinarian cast coast of Scotland, attached himself to the New-Light party, as the youth was thereby thrown among those who had no depth of piety, and who rather rejoiced in the ebullitions against religion which he uttered in moments of passion, which he never meant to publish, and over which he lamented in his declining life. Burns ever held firmly by the great truths of natural religion, and had a profound reverence for the Bible, to which he turned fondly in his latter days: he seems often, always in times of impulse, to have prayed, and would rise from his prayers to write to Clarinda: "I have just been before the throne of my God, Clarinda; according to my association of ideas [observe the Scotch metaphysics], my sentiments of love and friendship, I next devote myself to you." He declared, in the presence of the elegant Dr. Blair, that his favorite preacher in Edinburgh was the evangelical Dr. Walker. Burns lived in the age in which, contemporaneous with the declining p;ety, the two great vices of Scotland, intemperance and illicit intercourse of young nen and women, descended to the common people. The evangelical ministers had not the courage to check in the bud the rising intemperance, and, in the second age of moderatism, many of the moderate clergy became the victims of it. The dwellings of the Scottish peasantry were wretched; and court. ship among the young people was concealed as if it were a crime, and driven out of the house into places of darkness, the summons to which is indicated in the line, " Whistle, and I'll come to you, my lad." The consequence was, coarse tastes among the small farmers' and cotters' daughters and servant girls, which neither the evangelicals nor the moral philosophers or clergy bred by them sought to refine. Cromek, speaking of Burns's visit to Edinburgh, says: " But a refined and accomplished woman was a thing almost new to him, and of which he had formed but a very inadequate idea." The evil was not lessened, but rather fomented, by the coarse mode of public ecclesiastical discipline which greatly chafed Burns when applied to him. I am convinced that the conduct and poetry of Burns helped greatly to foster the national vices. I speak what I know, as my boyish days were spent in the land of Burns, and I met wilh old men who knew Burns and the state of society in which he lived.

[77]I've sent you here, by johnie Simson,
Twa sage philosophers to glimpse on:
Smith wi' his
sympathetic feeling,
And Reid to common sense appealing.
Philosophers have fought and wrangled,
And mickle Greek and latin mangled,
Till, wi' their logic-jargon tired
And in the depth of science mired,
To common sense they now appeal,
That wives and wabsters see and feel. It is curious to find Bums referring to the philosophy of Spinoza.

[78]In Stewart's class he wrote an essay on the "Manners and Customs of the Northern Nations," and the professor said, "the author of this paper shows much knowledge of his

subject, and a great taste for such researches." Scott became, before the close of the session, a frequent visitor in Mr. Stewart's family, and an affectionate intercourse was maintained between them through their after lives. (Lockhart's " Life of Scott ")
[79]In "Dissertatio Philosophica Inauguralis de Analogia et Philosophia Prima," Feb. 23, 1739, Professor Cleghorn says: " Idea innata nulla est. Aptitudo qumdam innata menti inest qua ad ideas hasce, vulgo innatas dictas? percipiendas approbandasque, quandocumque se obtulerit necessario dirigetur."
[80]I have employed more time than I would like to tell any one, in searching after the Scottish ancestry of Kant, but without success. I find that the name Cant was not uncommon in Forfarshire in last century: it occurs on the tombstones in a number of churchyards. In a map of a piece of ground at the north end of Brechin, there is mention of its belonging successively to George Cant and Alex. ander Cant. There was a James Cant, weaver in Brechin, admitted to the guild in 1779. I have seen a deed in which George Scott sells, in 1799, to John Cant, tanner in Brechin, a piece of property on the east side of High Street. It had been bought in I 796 by the two, in a contract of copartnery for carrying on the business of manufacturing and selling of leather. As leather and saddlery are connected, I have at times favored the idea that Kant, the saddler, may have been descended from the same Cants as John Cant, the tanner, who it is understood came from Montrose to Brechin. It is proper to state that I have been assisted in these researches by D. 1). Black, Esq., town clerk, Brechin.
[81]"The Collected Works of Dugald Stewart, edited by Sir William Hamilton, Bart., with a Memoir of Dugald Stewart, by John Veitch."
[82]It is an interesting circumstance that, perhaps, the fairest estimate which we have of Bacon and the inductive system is by a German, Kuno Fischer, in We " Francis Bacon of Verulam " (translated by Oxenford). He errs, however, after the usual German mode of theorizing, in connecting Bacon with such men as Hobbes and Hume, the former of whom never professed to follow the Baconian method, and the latter of whom formed a very low estimate of Bacon, and has been most effectively met by Reid and Stewart, who professedly and really adopted the inductive system. This has been shown by Remusat, in his pleasantively written and judicious work, " Bacon: Sa Vie, son Temps, sa Philosophic where there is a just estimate of Bacon's general philosophy, and some good remarks on the metaphysical points involved in induction.
[83]The intellectual side has been brought out to view by Henry Rogers, Professor Bowen of Harvard, and Professor Webb of Dublin.
[84]"Account of the Life and Writings of Thomas Brown, M.D." (1825), by David Welsh. Shorter Memoir by same prefixed to Brown's " Lectures."
[85]"Life of Francis Jeffrey," by Lord Cockburn.
[86]I am afraid we cannot claim Sydney Smith (born 1771, died 1845) as one of the Scotch metaphysicians as he was not a Scotchman: he merely resided for a time in Edinburgh. But his "Lectures on Moral Philosophy," delivered in London, 1804-6, and published in a volume (1850), is drawn from the Scottish philosophy, especially from Stewart, and is a

remarkably clear, lively, and judicious work.

[87]Thus of Wordsworth's "Excursion" Jeffrey says: "This will never do." "It is longer, weaker, and tamer than any of Mr. Wordsworth's other productions." Of Goethe's "Wilhelm Meister " he says: "To us it certainly appears, after the most deliberate consideration, to be eminently absurd, puerile, incongruous, vulgar, and affected; and, though redeemed by considerable powers of invention and some traits of vivacity, to be so far from perfection as to be almost from beginning to end one flagrant offence against every principle of taste and every rule of composition." How different the estimate formed by Thomas Car lyle of the second period of the Edinburgh Review ! The late Lord Ashburton shortly after the decease of his lady, who was a great admirer of Carlyle, did the author of this work the honor of applying to him to explain what Carlyle could mean by an advice which he gave. "I inquired of him," said his Lordship, "what I could do to form my character, and make myself what I ought to be. `Read "Wilheim Meister,"' said he. So I read I Wilhelm Meister' and went back to my counsellor, saying that I had read the book and admired it, but could not discover any thing in it fitted to accomplish the end I have in view. `Read "Wilhelm Meister,"' said the great man, `a second time.' Now I have read it a second time without getting what I wish. I now come to you to see if you can tell me what Carlyle can mean." .I told him he must go to the oracle himself to find out what he meant: but I added that I believed that neither Goethe nor Carlyle, though eminent literary geniuses, knew of, or could direct him to, what might effect the good end his Lordship had in view.

[88]"Memoirs of the Life of the Right Honorable Sir James Mackintosh," edited by his son, Robert James Mackintosh.

[89]The Life and Times of Henry Lord Brougham, written by himself.

[90]He was to be received at Brechin in the parish church. He separated from those who were to conduct him, and came to the door in tartan trews, and was refused entrance by an old sergeant who had charge of the admission. " Do not you know," thundered his lordship, "that in order of mine could hang you on that lamp-post? " To which the sergeant replied that he knew nothing as to what the person addressing him could do, but he knew that it was his duty not to allow any one to enter at that door without an express order.

[91]Laetitia autem et libido in bunorum opinione versatur, &c.

[92]"Lectures on Intellectual Philosophy, by the late John Young, with a Memoir of the Author, edited by William Cairns."

[93]"Autobiography by John Stuart Mill; " " Personal Life of George Grote," by Mrs. Grote; &c.

[94]I had this from a son of Dr. Foote, Archibald Foote, Esq., -- manufacturer, Montrose, to whom John Stuart Mill applied to get information about his father, who does not seem to have been very communicative to his family about his parentage or younger years.

[95]It is said that he published two sermons under the name of James Miln or Milne.

[96]I had this from the late John Pim, of Belfast, who was at the place at the time. I would not have referred to it had the suicide been the rcsult of a mental derangement: it was the logical consequence of the philosophic training.

[97]Recollections of Rev. John Ballantyne," an address delivered at a soiric on opening the new United Presbyterian Church, Stonehaven, by Rev. John Longmtiir, Aberdeen, 1862.
[98]"Memoir of Thomas Chalmers," by William Hanna.
[99]In fact, " Daft Tam Chalmers " was a phrase applied to him by those who could not discern his greatness in the bud.
[100]"Memoir of Dr. Welsh," by Alexander Dunlop, Esq., prefixed to Sermons.
[101]"Christopher North. A Memoir of John Wilson, by his daughter, Mrs. Gordon."
[102]Article by Thomas Spencer Baynes in " Edinburgh Essays " by members of the University of Edinburgh; " Memoir of Sir William Hamilton" by John Veitch.
[103]In this letter, and in of those that follow, them is a great deal said about a young man named Robert Haliday, who is studying at Glasgow, and about whom Hutch is very anxious.

Chapter I: Introductory

THE subject of this Essay is not the so-called Liberty of the Will, so unfortunately opposed to the misnamed doctrine of Philosophical Necessity; but Civil, or Social Liberty: the nature and limits of the power which can be legitimately exercised by society over the individual. A question seldom stated, and hardly ever discussed, in general terms, but which profoundly influences the practical controversies of the age by its latent presence, and is likely soon to make itself recognized as the vital question of the future. It is so far from being new, that, in a certain sense, it has divided mankind, almost from the remotest ages, but in the stage of progress into which the more civilized portions of the species have now entered, it presents itself under new conditions, and requires a different and more fundamental treatment.

The struggle between Liberty and Authority is the most conspicuous feature in the portions of history with which we are earliest familiar, particularly in that of Greece, Rome, and England. But in old times this contest was between subjects, or some classes of subjects, and the government. By liberty, was meant protection against the tyranny of the political rulers. The rulers were conceived (except in some of the popular governments of Greece) as in a necessarily antagonistic position to the people whom they ruled. They consisted of a governing One, or a governing tribe or caste, who derived their authority from inheritance or conquest; who, at all events, did not hold it at the pleasure of the governed, and whose supremacy men did not venture, perhaps did not desire, to contest, whatever precautions might be taken against its oppressive exercise. Their power was regarded as necessary, but also as highly dangerous; as a weapon which they would attempt to use against their subjects, no less than against external enemies. To prevent the weaker members of the community from being preyed upon by innumerable vultures, it was needful that there should be an animal of prey stronger than the rest, commissioned to keep them down. But as the king of the vultures would be no less bent upon preying upon the flock than any of the minor

harpies, it was indispensable to be in a perpetual attitude of defence against his beak and claws. The aim, therefore, of patriots, was to set limits to the power which the ruler should be suffered to exercise over the community; and this limitation was what they meant by liberty. It was attempted in two ways. First, by obtaining a recognition of certain immunities, called political liberties or rights, which it was to be regarded as a breach of duty in the ruler to infringe, and which, if he did infringe, specific resistance, or general rebellion, was held to be justifiable. A second, and generally a later expedient, was the establishment of constitutional checks; by which the consent of the community, or of a body of some sort supposed to represent its interests, was made a necessary condition to some of the more important acts of the governing power. To the first of these modes of limitation, the ruling power, in most European countries, was compelled, more or less, to submit. It was not so with the second; and to attain this, or when already in some degree possessed, to attain it more completely, became everywhere the principal object of the lovers of liberty. And so long as mankind were content to combat one enemy by another, and to be ruled by a master, on condition of being guaranteed more or less efficaciously against his tyranny, they did not carry their aspirations beyond this point.

A time, however, came in the progress of human affairs, when men ceased to think it a necessity of nature that their governors should be an independent power, opposed in interest to themselves. It appeared to them much better that the various magistrates of the State should be their tenants or delegates, revocable at their pleasure. In that way alone, it seemed, could they have complete security that the powers of government would never be abused to their disadvantage. By degrees, this new demand for elective and temporary rulers became the prominent object of the exertions of the popular party, wherever any such party existed; and superseded, to a considerable extent, the previous efforts to limit the power of rulers. As the struggle proceeded for making the ruling power emanate from the periodical choice of the ruled, some persons began to think that too much importance had been attached to the limitation of the power itself. That (it might seem) was a resource against rulers whose interests were habitually opposed to those of the people. What was now wanted was, that the rulers should be identified with the people; that their interest and will should be the interest and will of the nation. The nation did not need to be protected against its own will. There was no fear of its tyrannizing over itself. Let the rulers be effectually responsible to it, promptly removable by it, and it could afford to trust them with power of which it could itself dictate the use to be made. Their power was but the nation's own power, concentrated, and in a form convenient for exercise. This mode of thought, or rather perhaps of feeling, was common among the last generation of European liberalism, in the Continental section of which, it still apparently predominates. Those who admit any limit to what a government may do, except in the case of such governments as they think ought not to exist, stand out as brilliant exceptions among the political thinkers of the Continent. A similar tone of

sentiment might by this time have been prevalent in our own country, if the circumstances which for a time encouraged it had continued unaltered.

But, in political and philosophical theories, as well as in persons, success discloses faults and infirmities which failure might have concealed from observation. The notion, that the people have no need to limit their power over themselves, might seem axiomatic, when popular government was a thing only dreamed about, or read of as having existed at some distant period of the past. Neither was that notion necessarily disturbed by such temporary aberrations as those of the French Revolution, the worst of which were the work of an usurping few, and which, in any case, belonged, not to the permanent working of popular institutions, but to a sudden and convulsive outbreak against monarchical and aristocratic despotism. In time, however, a democratic republic came to occupy a large portion of the earth's surface, and made itself felt as one of the most powerful members of the community of nations; and elective and responsible government became subject to the observations and criticisms which wait upon a great existing fact. It was now perceived that such phrases as "self-government," and "the power of the people over themselves," do not express the true state of the case. The "people" who exercise the power, are not always the same people with those over whom it is exercised, and the "self-government" spoken of, is not the government of each by himself, but of each by all the rest. The will of the people, moreover, practically means, the will of the most numerous or the most active part of the people; the majority, or those who succeed in making themselves accepted as the majority; the people, consequently, may desire to oppress a part of their number; and precautions are as much needed against this, as against any other abuse of power. The limitation, therefore, of the power of government over individuals, loses none of its importance when the holders of power are regularly accountable to the community, that is, to the strongest party therein. This view of things, recommending itself equally to the intelligence of thinkers and to the inclination of those important classes in European society to whose real or supposed interests democracy is adverse, has had no difficulty in establishing itself; and in political speculations "the tyranny of the majority" is now generally included among the evils against which society requires to be on its guard.

Like other tyrannies, the tyranny of the majority was at first, and is still vulgarly, held in dread, chiefly as operating through the acts of the public authorities. But reflecting persons perceived that when society is itself the tyrant -- society collectively, over the separate individuals who compose it -- its means of tyrannizing are not restricted to the acts which it may do by the hands of its political functionaries. Society can and does execute its own mandates: and if it issues wrong mandates instead of right, or any mandates at all in things with which it ought not to meddle, it practises a social tyranny more formidable than many kinds of political oppression, since, though not usually upheld by such extreme penalties, it leaves fewer means of escape, penetrating much more deeply into the

details of life, and enslaving the soul itself. Protection, therefore, against the tyranny of the magistrate is not enough; there needs protection also against the tyranny of the prevailing opinion and feeling; against the tendency of society to impose, by other means than civil penalties, its own ideas and practices as rules of conduct on those who dissent from them; to fetter the development, and, if possible, prevent the formation, of any individuality not in harmony with its ways, and compel all characters to fashion themselves upon the model of its own. There is a limit to the legitimate interference of collective opinion with individual independence; and to find that limit, and maintain it against encroachment, is as indispensable to a good condition of human affairs, as protection against political despotism.

But though this proposition is not likely to be contested in general terms, the practical question, where to place the limit -- how to make the fitting adjustment between individual independence and social control -- is a subject on which nearly everything remains to be done. All that makes existence valuable to any one, depends on the enforcement of restraints upon the actions of other people. Some rules of conduct, therefore, must be imposed, by law in the first place, and by opinion on many things which are not fit subjects for the operation of law. What these rules should be, is the principal question in human affairs; but if we except a few of the most obvious cases, it is one of those which least progress has been made in resolving. No two ages, and scarcely any two countries, have decided it alike; and the decision of one age or country is a wonder to another. Yet the people of any given age and country no more suspect any difficulty in it, than if it were a subject on which mankind had always been agreed. The rules which obtain among themselves appear to them self-evident and self-justifying. This all but universal illusion is one of the examples of the magical influence of custom, which is not only, as the proverb says a second nature, but is continually mistaken for the first. The effect of custom, in preventing any misgiving respecting the rules of conduct which mankind impose on one another, is all the more complete because the subJect is one on which it is not generally considered necessary that reasons should be given, either by one person to others, or by each to himself. People are accustomed to believe and have been encouraged in the belief by some who aspire to the character of philosophers, that their feelings, on subjects of this nature, are better than reasons, and render reasons unnecessary. The practical principle which guides them to their opinions on the regulation of human conduct, is the feeling in each person's mind that everybody should be required to act as he, and those with whom he sympathizes, would like them to act. No one, indeed, acknowledges to himself that his standard of judgment is his own liking; but an opinion on a point of conduct, not supported by reasons, can only count as one person's preference; and if the reasons, when given, are a mere appeal to a similar preference felt by other people, it is still only many people's liking instead of one. To an ordinary man, however, his own preference, thus supported, is not only a perfectly satisfactory reason, but the only one he generally has for

any of his notions of morality, taste, or propriety, which are not expressly written in his religious creed; and his chief guide in the interpretation even of that. Men's opinions, accordingly, on what is laudable or blamable, are affected by all the multifarious causes which influence their wishes in regard to the conduct of others, and which are as numerous as those which determine their wishes on any other subject. Sometimes their reason -- at other times their prejudices or superstitions: often their social affections, not seldom their antisocial ones, their envy or jealousy, their arrogance or contemptuousness: but most commonly, their desires or fears for themselves -- their legitimate or illegitimate self-interest. Wherever there is an ascendant class, a large portion of the morality of the country emanates from its class interests, and its feelings of class superiority. The morality between Spartans and Helots, between planters and negroes, between princes and subjects, between nobles and roturiers, between men and women, has been for the most part the creation of these class interests and feelings: and the sentiments thus generated, react in turn upon the moral feelings of the members of the ascendant class, in their relations among themselves. Where, on the other hand, a class, formerly ascendant, has lost its ascendency, or where its ascendency is unpopular, the prevailing moral sentiments frequently bear the impress of an impatient dislike of superiority. Another grand determining principle of the rules of conduct, both in act and forbearance which have been enforced by law or opinion, has been the servility of mankind towards the supposed preferences or aversions of their temporal masters, or of their gods. This servility though essentially selfish, is not hypocrisy; it gives rise to perfectly genuine sentiments of abhorrence; it made men burn magicians and heretics. Among so many baser influences, the general and obvious interests of society have of course had a share, and a large one, in the direction of the moral sentiments: less, however, as a matter of reason, and on their own account, than as a consequence of the sympathies and antipathies which grew out of them: and sympathies and antipathies which had little or nothing to do with the interests of society, have made themselves felt in the establishment of moralities with quite as great force.

The likings and dislikings of society, or of some powerful portion of it, are thus the main thing which has practically determined the rules laid down for general observance, under the penalties of law or opinion. And in general, those who have been in advance of society in thought and feeling, have left this condition of things unassailed in principle, however they may have come into conflict with it in some of its details. They have occupied themselves rather in inquiring what things society ought to like or dislike, than in questioning whether its likings or dislikings should be a law to individuals. They preferred endeavouring to alter the feelings of mankind on the particular points on which they were themselves heretical, rather than make common cause in defence of freedom, with heretics generally. The only case in which the higher ground has been taken on principle and maintained with consistency, by any but an individual here and there, is that of religious belief: a case instructive in many ways, and not

least so as forming a most striking instance of the fallibility of what is called the moral sense: for the odium theologicum, in a sincere bigot, is one of the most unequivocal cases of moral feeling. Those who first broke the yoke of what called itself the Universal Church, were in general as little willing to permit difference of religious opinion as that church itself. But when the heat of the conflict was over, without giving a complete victory to any party, and each church or sect was reduced to limit its hopes to retaining possession of the ground it already occupied; minorities, seeing that they had no chance of becoming majorities, were under the necessity of pleading to those whom they could not convert, for permission to differ. It is accordingly on this battle-field, almost solely, that the rights of the individual against society have been asserted on broad grounds of principle, and the claim of society to exercise authority over dissentients openly controverted. The great writers to whom the world owes what religious liberty it possesses, have mostly asserted freedom of conscience as an indefeasible right, and denied absolutely that a human being is accountable to others for his religious belief. Yet so natural to mankind is intolerance in whatever they really care about, that religious freedom has hardly anywhere been practically realized, except where religious indifference, which dislikes to have its peace disturbed by theological quarrels, has added its weight to the scale. In the minds of almost all religious persons, even in the most tolerant countries, the duty of toleration is admitted with tacit reserves. One person will bear with dissent in matters of church government, but not of dogma; another can tolerate everybody, short of a Papist or an Unitarian; another, every one who believes in revealed religion; a few extend their charity a little further, but stop at the belief in a God and in a future state. Wherever the sentiment of the majority is still genuine and intense, it is found to have abated little of its claim to be obeyed.

In England, from the peculiar circumstances of our political history, though the yoke of opinion is perhaps heavier, that of law is lighter, than in most other countries of Europe; and there is considerable jealousy of direct interference, by the legislative or the executive power with private conduct; not so much from any just regard for the independence of the individual, as from the still subsisting habit of looking on the government as representing an opposite interest to the public. The majority have not yet learnt to feel the power of the government their power, or its opinions their opinions. When they do so, individual liberty will probably be as much exposed to invasion from the government, as it already is from public opinion. But, as yet, there is a considerable amount of feeling ready to be called forth against any attempt of the law to control individuals in things in which they have not hitherto been accustomed to be controlled by it; and this with very little discrimination as to whether the matter is, or is not, within the legitimate sphere of legal control; insomuch that the feeling, highly salutary on the whole, is perhaps quite as often misplaced as well grounded in the particular instances of its application.

There is, in fact, no recognized principle by which the propriety or impropriety of government interference is customarily tested. People decide according to their personal preferences. Some, whenever they see any good to be done, or evil to be remedied, would willingly instigate the government to undertake the business; while others prefer to bear almost any amount of social evil, rather than add one to the departments of human interests amenable to governmental control. And men range themselves on one or the other side in any particular case, according to this general direction of their sentiments; or according to the degree of interest which they feel in the particular thing which it is proposed that the government should do; or according to the belief they entertain that the government would, or would not, do it in the manner they prefer; but very rarely on account of any opinion to which they consistently adhere, as to what things are fit to be done by a government. And it seems to me that, in consequence of this absence of rule or principle, one side is at present as often wrong as the other; the interference of government is, with about equal frequency, improperly invoked and improperly condemned.

The object of this Essay is to assert one very simple principle, as entitled to govern absolutely the dealings of society with the individual in the way of compulsion and control, whether the means used be physical force in the form of legal penalties, or the moral coercion of public opinion. That principle is, that the sole end for which mankind are warranted, individually or collectively in interfering with the liberty of action of any of their number, is self-protection. That the only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do so, because it will make him happier, because, in the opinions of others, to do so would be wise, or even right. These are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him, or visiting him with any evil, in case he do otherwise. To justify that, the conduct from which it is desired to deter him must be calculated to produce evil to some one else. The only part of the conduct of any one, for which he is amenable to society, is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. Over himself, over his own body and mind, the individual is sovereign.

It is, perhaps, hardly necessary to say that this doctrine is meant to apply only to human beings in the maturity of their faculties. We are not speaking of children, or of young persons below the age which the law may fix as that of manhood or womanhood. Those who are still in a state to require being taken care of by others, must be protected against their own actions as well as against external injury. For the same reason, we may leave out of consideration those backward states of society in which the race itself may be considered as in its nonage. The early difficulties in the way of spontaneous progress are so great, that there is seldom any choice of means for

overcoming them; and a ruler full of the spirit of improvement is warranted in the use of any expedients that will attain an end, perhaps otherwise unattainable. Despotism is a legitimate mode of government in dealing with barbarians, provided the end be their improvement, and the means justified by actually effecting that end. Liberty, as a principle, has no application to any state of things anterior to the time when mankind have become capable of being improved by free and equal discussion. Until then, there is nothing for them but implicit obedience to an Akbar or a Charlemagne, if they are so fortunate as to find one. But as soon as mankind have attained the capacity of being guided to their own improvement by conviction or persuasion (a period long since reached in all nations with whom we need here concern ourselves), compulsion, either in the direct form or in that of pains and penalties for non-compliance, is no longer admissible as a means to their own good, and justifiable only for the security of others.

It is proper to state that I forego any advantage which could be derived to my argument from the idea of abstract right as a thing independent of utility. I regard utility as the ultimate appeal on all ethical questions; but it must be utility in the largest sense, grounded on the permanent interests of man as a progressive being. Those interests, I contend, authorize the subjection of individual spontaneity to external control, only in respect to those actions of each, which concern the interest of other people. If any one does an act hurtful to others, there is a prima facie case for punishing him, by law, or, where legal penalties are not safely applicable, by general disapprobation. There are also many positive acts for the benefit of others, which he may rightfully be compelled to perform; such as, to give evidence in a court of justice; to bear his fair share in the common defence, or in any other joint work necessary to the interest of the society of which he enjoys the protection; and to perform certain acts of individual beneficence, such as saving a fellow-creature's life, or interposing to protect the defenceless against ill-usage, things which whenever it is obviously a man's duty to do, he may rightfully be made responsible to society for not doing. A person may cause evil to others not only by his actions but by his inaction, and in neither case he is justly accountable to them for the injury. The latter case, it is true, requires a much more cautious exercise of compulsion than the former. To make any one answerable for doing evil to others, is the rule; to make him answerable for not preventing evil, is, comparatively speaking, the exception. Yet there are many cases clear enough and grave enough to justify that exception. In all things which regard the external relations of the individual, he is de jure amenable to those whose interests are concerned, and if need be, to society as their protector. There are often good reasons for not holding him to the responsibility; but these reasons must arise from the special expediencies of the case: either because it is a kind of case in which he is on the whole likely to act better, when left to his own discretion, than when controlled in any way in which society have it in their power to control him; or because the attempt to exercise control would produce other evils, greater than those which it would prevent. When such reasons as these preclude the

enforcement of responsibility, the conscience of the agent himself should step into the vacant judgment-seat, and protect those interests of others which have no external protection; judging himself all the more rigidly, because the case does not admit of his being made accountable to the judgment of his fellowcreatures.

But there is a sphere of action in which society, as distinguished from the individual, has, if any, only an indirect interest; comprehending all that portion of a person's life and conduct which affects only himself, or, if it also affects others, only with their free, voluntary, and undeceived consent and participation. When I say only himself, I mean directly, and in the first instance: for whatever affects himself, may affect others through himself; and the objection which may be grounded on this contingency, will receive consideration in the sequel. This, then, is the appropriate region of human liberty. It comprises, first, the inward domain of consciousness; demanding liberty of conscience, in the most comprehensive sense; liberty of thought and feeling; absolute freedom of opinion and sentiment on all subjects, practical or speculative, scientific, moral, or theological. The liberty of expressing and publishing opinions may seem to fall under a different principle, since it belongs to that part of the conduct of an individual which concerns other people; but, being almost of as much importance as the liberty of thought itself, and resting in great part on the same reasons, is practically inseparable from it. Secondly, the principle requires liberty of tastes and pursuits; of framing the plan of our life to suit our own character; of doing as we like, subject to such consequences as may follow; without impediment from our fellow-creatures, so long as what we do does not harm them even though they should think our conduct foolish, perverse, or wrong. Thirdly, from this liberty of each individual, follows the liberty, within the same limits, of combination among individuals; freedom to unite, for any purpose not involving harm to others: the persons combining being supposed to be of full age, and not forced or deceived.

No society in which these liberties are not, on the whole, respected, is free, whatever may be its form of government; and none is completely free in which they do not exist absolute and unqualified. The only freedom which deserves the name, is that of pursuing our own good in our own way, so long as we do not attempt to deprive others of theirs, or impede their efforts to obtain it. Each is the proper guardian of his own health, whether bodily, or mental or spiritual. Mankind are greater gainers by suffering each other to live as seems good to themselves, than by compelling each to live as seems good to the rest.

Though this doctrine is anything but new, and, to some persons, may have the air of a truism, there is no doctrine which stands more directly opposed to the general tendency of existing opinion and practice. Society has expended fully as much effort in the attempt (according to its lights) to compel people to conform to its notions of personal, as of social excellence. The ancient commonwealths thought themselves entitled to practise, and the ancient

philosophers countenanced, the regulation of every part of private conduct by public authority, on the ground that the State had a deep interest in the whole bodily and mental discipline of every one of its citizens, a mode of thinking which may have been admissible in small republics surrounded by powerful enemies, in constant peril of being subverted by foreign attack or internal commotion, and to which even a short interval of relaxed energy and self-command might so easily be fatal, that they could not afford to wait for the salutary permanent effects of freedom. In the modern world, the greater size of political communities, and above all, the separation between the spiritual and temporal authority (which placed the direction of men's consciences in other hands than those which controlled their worldly affairs), prevented so great an interference by law in the details of private life; but the engines of moral repression have been wielded more strenuously against divergence from the reigning opinion in self-regarding, than even in social matters; religion, the most powerful of the elements which have entered into the formation of moral feeling, having almost always been governed either by the ambition of a hierarchy, seeking control over every department of human conduct, or by the spirit of Puritanism. And some of those modern reformers who have placed themselves in strongest opposition to the religions of the past, have been noway behind either churches or sects in their assertion of the right of spiritual domination: M. Comte, in particular, whose social system, as unfolded in his Traite de Politique Positive, aims at establishing (though by moral more than by legal appliances) a despotism of society over the individual, surpassing anything contemplated in the political ideal of the most rigid disciplinarian among the ancient philosophers.

Apart from the peculiar tenets of individual thinkers, there is also in the world at large an increasing inclination to stretch unduly the powers of society over the individual, both by the force of opinion and even by that of legislation: and as the tendency of all the changes taking place in the world is to strengthen society, and diminish the power of the individual, this encroachment is not one of the evils which tend spontaneously to disappear, but, on the contrary, to grow more and more formidable. The disposition of mankind, whether as rulers or as fellow-citizens, to impose their own opinions and inclinations as a rule of conduct on others, is so energetically supported by some of the best and by some of the worst feelings incident to human nature, that it is hardly ever kept under restraint by anything but want of power; and as the power is not declining, but growing, unless a strong barrier of moral conviction can be raised against the mischief, we must expect, in the present circumstances of the world, to see it increase.

It will be convenient for the argument, if, instead of at once entering upon the general thesis, we confine ourselves in the first instance to a single branch of it, on which the principle here stated is, if not fully, yet to a certain point, recognized by the current opinions. This one branch is the Liberty of Thought: from which it is impossible to separate the cognate liberty of speaking and

of writing. Although these liberties, to some considerable amount, form part of the political morality of all countries which profess religious toleration and free institutions, the grounds, both philosophical and practical, on which they rest, are perhaps not so familiar to the general mind, nor so thoroughly appreciated by many even of the leaders of opinion, as might have been expected. Those grounds, when rightly understood, are of much wider application than to only one division of the subject, and a thorough consideration of this part of the question will be found the best introduction to the remainder. Those to whom nothing which I am about to say will be new, may therefore, I hope, excuse me, if on a subject which for now three centuries has been so often discussed, I venture on one discussion more.

* * * *

Chapter II: Of The Liberty Of Thought And Discussion

THE time, it is to be hoped, is gone by when any defence would be necessary of the "liberty of the press" as one of the securities against corrupt or tyrannical government. No argument, we may suppose, can now be needed, against permitting a legislature or an executive, not identified in interest with the people, to prescribe opinions to them, and determine what doctrines or what arguments they shall be allowed to hear. This aspect of the question, besides, has been so often and so triumphantly enforced by preceding writers, that it needs not be specially insisted on in this place. Though the law of England, on the subject of the press, is as servile to this day as it was in the time of the Tudors, there is little danger of its being actually put in force against political discussion, except during some temporary panic, when fear of insurrection drives ministers and judges from their propriety;[1] and, speaking generally, it is not, in constitutional countries, to be apprehended that the government, whether completely responsible to the people or not, will often attempt to control the expression of opinion, except when in doing so it makes itself the organ of the general intolerance of the public. Let us suppose, therefore, that the government is entirely at one with the people, and never thinks of exerting any power of coercion unless in agreement with what it conceives to be their voice. But I deny the right of the people to exercise such coercion, either by themselves or by their government. The power itself is illegitimate. The best government has no more title to it than the worst. It is as noxious, or more noxious, when exerted in accordance with public opinion, than when in opposition to it. If all mankind minus one, were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind. Were an opinion a personal possession of no value except to the owner; if to be obstructed in the enjoyment of it were simply a private injury, it would make some difference whether the injury was inflicted only on a few persons or on many. But the peculiar evil of silencing the expression of an opinion is, that it is robbing the human race; posterity as well as the existing generation; those who dissent from the opinion, still more

than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth: if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth, produced by its collision with error.

It is necessary to consider separately these two hypotheses, each of which has a distinct branch of the argument corresponding to it. We can never be sure that the opinion we are endeavouring to stifle is a false opinion; and if we were sure, stifling it would be an evil still.

First: the opinion which it is attempted to suppress by authority may possibly be true. Those who desire to suppress it, of course deny its truth; but they are not infallible. They have no authority to decide the question for all mankind, and exclude every other person from the means of judging. To refuse a hearing to an opinion, because they are sure that it is false, is to assume that their certainty is the same thing as absolute certainty. All silencing of discussion is an assumption of infallibility. Its condemnation may be allowed to rest on this common argument, not the worse for being common.

Unfortunately for the good sense of mankind, the fact of their fallibility is far from carrying the weight in their practical judgment, which is always allowed to it in theory; for while every one well knows himself to be fallible, few think it necessary to take any precautions against their own fallibility, or admit the supposition that any opinion of which they feel very certain, may be one of the examples of the error to which they acknowledge themselves to be liable. Absolute princes, or others who are accustomed to unlimited deference, usually feel this complete confidence in their own opinions on nearly all subjects. People more happily situated, who sometimes hear their opinions disputed, and are not wholly unused to be set right when they are wrong, place the same unbounded reliance only on such of their opinions as are shared by all who surround them, or to whom they habitually defer: for in proportion to a man's want of confidence in his own solitary judgment, does he usually repose, with implicit trust, on the infallibility of "the world" in general. And the world, to each individual, means the part of it with which he comes in contact; his party, his sect, his church, his class of society: the man may be called, by comparison, almost liberal and largeminded to whom it means anything so comprehensive as his own country or his own age. Nor is his faith in this collective authority at all shaken by his being aware that other ages, countries, sects, churches, classes, and parties have thought, and even now think, the exact reverse. He devolves upon his own world the responsibility of being in the right against the dissentient worlds of other people; and it never troubles him that mere accident has decided which of these numerous worlds is the object of his reliance, and that the same causes which make him a Churchman in London, would have made him a Buddhist or a Confucian in Pekin. Yet it is as evident in itself as any amount of argument can make it, that ages are no more infallible than individuals; every age having held many opinions which subsequent ages have deemed not only false

but absurd; and it is as certain that many opinions, now general, will be rejected by future ages, as it is that many, once general, are rejected by the present.

The objection likely to be made to this argument, would probably take some such form as the following. There is no greater assumption of infallibility in forbidding the propagation of error, than in any other thing which is done by public authority on its own judgment and responsibility. Judgment is given to men that they may use it. Because it may be used erroneously, are men to be told that they ought not to use it at all? To prohibit what they think pernicious, is not claiming exemption from error, but fulfilling the duty incumbent on them, although fallible, of acting on their conscientious conviction. If we were never to act on our opinions, because those opinions may be wrong, we should leave all our interests uncared for, and all our duties unperformed. An objection which applies to all conduct can be no valid objection to any conduct in particular.

It is the duty of governments, and of individuals, to form the truest opinions they can; to form them carefully, and never impose them upon others unless they are quite sure of being right. But when they are sure (such reasoners may say), it is not conscientiousness but cowardice to shrink from acting on their opinions, and allow doctrines which they honestly think dangerous to the welfare of mankind, either in this life or in another, to be scattered abroad without restraint, because other people, in less enlightened times, have persecuted opinions now believed to be true. Let us take care, it may be said, not to make the same mistake: but governments and nations have made mistakes in other things, which are not denied to be fit subjects for the exercise of authority: they have laid on bad taxes, made unjust wars. Ought we therefore to lay on no taxes, and, under whatever provocation, make no wars? Men, and governments, must act to the best of their ability. There is no such thing as absolute certainty, but there is assurance sufficient for the purposes of human life. We may, and must, assume our opinion to be true for the guidance of our own conduct: and it is assuming no more when we forbid bad men to pervert society by the propagation of opinions which we regard as false and pernicious.

I answer, that it is assuming very much more. There is the greatest difference between presuming an opinion to be true, because, with every opportunity for contesting it, it has not been refuted, and assuming its truth for the purpose of not permitting its refutation. Complete liberty of contradicting and disproving our opinion, is the very condition which justifies us in assuming its truth for purposes of action; and on no other terms can a being with human faculties have any rational assurance of being right.

When we consider either the history of opinion, or the ordinary conduct of human life, to what is it to be ascribed that the one and the other are no worse than they are? Not certainly to the inherent force of the human understanding; for, on any matter not self-evident, there are ninety-nine persons totally incapable of judging of it, for one who is

capable; and the capacity of the hundredth person is only comparative; for the majority of the eminent men of every past generation held many opinions now known to be erroneous, and did or approved numerous things which no one will now justify. Why is it, then, that there is on the whole a preponderance among mankind of rational opinions and rational conduct? If there really is this preponderance -- which there must be, unless human affairs are, and have always been, in an almost desperate state -- it is owing to a quality of the human mind, the source of everything respectable in man, either as an intellectual or as a moral being, namely, that his errors are corrigible. He is capable of rectifying his mistakes by discussion and experience. Not by experience alone. There must be discussion, to show how experience is to be interpreted. Wrong opinions and practices gradually yield to fact and argument: but facts and arguments, to produce any effect on the mind, must be brought before it. Very few facts are able to tell their own story, without comments to bring out their meaning. The whole strength and value, then, of human judgment, depending on the one property, that it can be set right when it is wrong, reliance can be placed on it only when the means of setting it right are kept constantly at hand. In the case of any person whose judgment is really deserving of confidence, how has it become so? Because he has kept his mind open to criticism of his opinions and conduct. Because it has been his practice to listen to all that could be said against him; to profit by as much of it as was just, and expound to himself, and upon occasion to others, the fallacy of what was fallacious. Because he has felt, that the only way in which a human being can make some approach to knowing the whole of a subject, is by hearing what can be said about it by persons of every variety of opinion, and studying all modes in which it can be looked at by every character of mind. No wise man ever acquired his wisdom in any mode but this; nor is it in the nature of human intellect to become wise in any other manner. The steady habit of correcting and completing his own opinion by collating it with those of others, so far from causing doubt and hesitation in carrying it into practice, is the only stable foundation for a just reliance on it: for, being cognizant of all that can, at least obviously, be said against him, and having taken up his position against all gainsayers knowing that he has sought for objections and difficulties, instead of avoiding them, and has shut out no light which can be thrown upon the subject from any quarter -- he has a right to think his judgment better than that of any person, or any multitude, who have not gone through a similar process.

It is not too much to require that what the wisest of mankind, those who are best entitled to trust their own judgment, find necessary to warrant their relying on it, should be submitted to by that miscellaneous collection of a few wise and many foolish individuals, called the public. The most intolerant of churches, the Roman Catholic Church, even at the canonization of a saint, admits, and listens patiently to, a "devil's advocate." The holiest of men, it appears, cannot be admitted to posthumous honors, until all that the devil could say against him is known and weighed. If even the Newtonian philosophy were not permitted to be questioned, mankind could not feel as complete assurance of

its truth as they now do. The beliefs which we have most warrant for, have no safeguard to rest on, but a standing invitation to the whole world to prove them unfounded. If the challenge is not accepted, or is accepted and the attempt fails, we are far enough from certainty still; but we have done the best that the existing state of human reason admits of; we have neglected nothing that could give the truth a chance of reaching us: if the lists are kept open, we may hope that if there be a better truth, it will be found when the human mind is capable of receiving it; and in the meantime we may rely on having attained such approach to truth, as is possible in our own day. This is the amount of certainty attainable by a fallible being, and this the sole way of attaining it.

Strange it is, that men should admit the validity of the arguments for free discussion, but object to their being "pushed to an extreme;" not seeing that unless the reasons are good for an extreme case, they are not good for any case. Strange that they should imagine that they are not assuming infallibility when they acknowledge that there should be free discussion on all subjects which can possibly be doubtful, but think that some particular principle or doctrine should be forbidden to be questioned because it is so certain, that is, because they are certain that it is certain. To call any proposition certain, while there is any one who would deny its certainty if permitted, but who is not permitted, is to assume that we ourselves, and those who agree with us, are the judges of certainty, and judges without hearing the other side.

In the present age -- which has been described as "destitute of faith, but terrified at scepticism," -- in which people feel sure, not so much that their opinions are true, as that they should not know what to do without them -- the claims of an opinion to be protected from public attack are rested not so much on its truth, as on its importance to society. There are, it is alleged, certain beliefs, so useful, not to say indispensable to well-being, that it is as much the duty of governments to uphold those beliefs, as to protect any other of the interests of society. In a case of such necessity, and so directly in the line of their duty, something less than infallibility may, it is maintained, warrant, and even bind, governments, to act on their own opinion, confirmed by the general opinion of mankind. It is also often argued, and still oftener thought, that none but bad men would desire to weaken these salutary beliefs; and there can be nothing wrong, it is thought, in restraining bad men, and prohibiting what only such men would wish to practise. This mode of thinking makes the justification of restraints on discussion not a question of the truth of doctrines, but of their usefulness; and flatters itself by that means to escape the responsibility of claiming to be an infallible judge of opinions. But those who thus satisfy themselves, do not perceive that the assumption of infallibility is merely shifted from one point to another. The usefulness of an opinion is itself matter of opinion: as disputable, as open to discussion and requiring discussion as much, as the opinion itself. There is the same need of an infallible judge of opinions to decide an opinion to be noxious, as to decide it to be false, unless the

opinion condemned has full opportunity of defending itself. And it will not do to say that the heretic may be allowed to maintain the utility or harmlessness of his opinion, though forbidden to maintain its truth. The truth of an opinion is part of its utility. If we would know whether or not it is desirable that a proposition should be believed, is it possible to exclude the consideration of whether or not it is true? In the opinion, not of bad men, but of the best men, no belief which is contrary to truth can be really useful: and can you prevent such men from urging that plea, when they are charged with culpability for denying some doctrine which they are told is useful, but which they believe to be false? Those who are on the side of received opinions, never fail to take all possible advantage of this plea; you do not find them handling the question of utility as if it could be completely abstracted from that of truth: on the contrary, it is, above all, because their doctrine is "the truth," that the knowledge or the belief of it is held to be so indispensable. There can be no fair discussion of the question of usefulness, when an argument so vital may be employed on one side, but not on the other. And in point of fact, when law or public feeling do not permit the truth of an opinion to be disputed, they are just as little tolerant of a denial of its usefulness. The utmost they allow is an extenuation of its absolute necessity or of the positive guilt of rejecting it.

In order more fully to illustrate the mischief of denying a hearing to opinions because we, in our own judgment, have condemned them, it will be desirable to fix down the discussion to a concrete case; and I choose, by preference, the cases which are least favourable to me -- in which the argument against freedom of opinion, both on the score of truth and on that of utility, is considered the strongest. Let the opinions impugned be the belief in a God and in a future state, or any of the commonly received doctrines of morality. To fight the battle on such ground, gives a great advantage to an unfair antagonist; since he will be sure to say (and many who have no desire to be unfair will say it internally), Are these the doctrines which you do not deem sufficiently certain to be taken under the protection of law? Is the belief in a God one of the opinions, to feel sure of which, you hold to be assuming infallibility? But I must be permitted to observe, that it is not the feeling sure of a doctrine (be it what it may) which I call an assumption of infallibility. It is the undertaking to decide that question for others, without allowing them to hear what can be said on the contrary side. And I denounce and reprobate this pretension not the less, if put forth on the side of my most solemn convictions. However positive any one's persuasion may be, not only of the falsity, but of the pernicious consequences -- not only of the pernicious consequences, but (to adopt expressions which I altogether condemn) the immorality and impiety of an opinion; yet if, in pursuance of that private judgment, though backed by the public judgment of his country or his cotemporaries, he prevents the opinion from being heard in its defence, he assumes infallibility. And so far from the assumption being less objectionable or less dangerous because the opinion is called immoral or impious, this is the case of all others in which it is most fatal. These are

exactly the occasions on which the men of one generation commit those dreadful mistakes which excite the astonishment and horror of posterity. It is among such that we find the instances memorable in history, when the arm of the law has been employed to root out the best men and the noblest doctrines; with deplorable success as to the men, though some of the doctrines have survived to be (as if in mockery) invoked, in defence of similar conduct towards those who dissent from them, or from their received interpretation.

Mankind can hardly be too often reminded, that there was once a man named Socrates, between whom and the legal authorities and public opinion of his time, there took place a memorable collision. Born in an age and country abounding in individual greatness, this man has been handed down to us by those who best knew both him and the age, as the most virtuous man in it; while we know him as the head and prototype of all subsequent teachers of virtue, the source equally of the lofty inspiration of Plato and the judicious utilitarianism of Aristotle, "i maestri di color che sanno," the two headsprings of ethical as of all other philosophy. This acknowledged master of all the eminent thinkers who have since lived -- whose fame, still growing after more than two thousand years, all but outweighs the whole remainder of the names which make his native city illustrious -- was put to death by his countrymen, after a judicial conviction, for impiety and immorality. Impiety, in denying the gods recognized by the State; indeed his accuser asserted (see the "Apologia") that he believed in no gods at all. Immorality, in being, by his doctrines and instructions, a "corrupter of youth." Of these charges the tribunal, there is every ground for believing, honestly found him guilty, and condemned the man who probably of all then born had deserved best of mankind, to be put to death as a criminal.

To pass from this to the only other instance of judicial iniquity, the mention of which, after the condemnation of Socrates, would not be an anti-climax: the event which took place on Calvary rather more than eighteen hundred years ago. The man who left on the memory of those who witnessed his life and conversation, such an impression of his moral grandeur, that eighteen subsequent centuries have done homage to him as the Almighty in person, was ignominiously put to death, as what? As a blasphemer. Men did not merely mistake their benefactor; they mistook him for the exact contrary of what he was, and treated him as that prodigy of impiety, which they themselves are now held to be, for their treatment of him. The feelings with which mankind now regard these lamentable transactions, especially the latter of the two, render them extremely unjust in their judgment of the unhappy actors. These were, to all appearance, not bad men -- not worse than men most commonly are, but rather the contrary; men who possessed in a full, or somewhat more than a full measure, the religious, moral, and patriotic feelings of their time and people: the very kind of men who, in all times, our own included, have every chance of passing through life blameless and respected. The high-priest who rent his garments when the words were pronounced, which, according to all the ideas of his country, constituted the blackest guilt, was in all

probability quite as sincere in his horror and indignation, as the generality of respectable and pious men now are in the religious and moral sentiments they profess; and most of those who now shudder at his conduct, if they had lived in his time and been born Jews, would have acted precisely as he did. Orthodox Christians who are tempted to think that those who stoned to death the first martyrs must have been worse men than they themselves are, ought to remember that one of those persecutors was Saint Paul.

Let us add one more example, the most striking of all, if the impressiveness of an error is measured by the wisdom and virtue of him who falls into it. If ever any one, possessed of power, had grounds for thinking himself the best and most enlightened among his cotemporaries, it was the Emperor Marcus Aurelius. Absolute monarch of the whole civilized world, he preserved through life not only the most unblemished justice, but what was less to be expected from his Stoical breeding, the tenderest heart. The few failings which are attributed to him, were all on the side of indulgence: while his writings, the highest ethical product of the ancient mind, differ scarcely perceptibly, if they differ at all, from the most characteristic teachings of Christ. This man, a better Christian in all but the dogmatic sense of the word, than almost any of the ostensibly Christian sovereigns who have since reigned, persecuted Christianity. Placed at the summit of all the previous attainments of humanity, with an open, unfettered intellect, and a character which led him of himself to embody in his moral writings the Christian ideal, he yet failed to see that Christianity was to be a good and not an evil to the world, with his duties to which he was so deeply penetrated. Existing society he knew to be in a deplorable state. But such as it was, he saw or thought he saw, that it was held together and prevented from being worse, by belief and reverence of the received divinities. As a ruler of mankind, he deemed it his duty not to suffer society to fall in pieces; and saw not how, if its existing ties were removed, any others could be formed which could again knit it together. The new religion openly aimed at dissolving these ties: unless, therefore, it was his duty to adopt that religion, it seemed to be his duty to put it down. Inasmuch then as the theology of Christianity did not appear to him true or of divine origin; inasmuch as this strange history of a crucified God was not credible to him, and a system which purported to rest entirely upon a foundation to him so wholly unbelievable, could not be foreseen by him to be that renovating agency which, after all abatements, it has in fact proved to be; the gentlest and most amiable of philosophers and rulers, under a solemn sense of duty, authorized the persecution of Christianity. To my mind this is one of the most tragical facts in all history. It is a bitter thought, how different a thing the Christianity of the world might have been, if the Christian faith had been adopted as the religion of the empire under the auspices of Marcus Aurelius instead of those of Constantine. But it would be equally unjust to him and false to truth, to deny, that no one plea which can be urged for punishing anti-Christian teaching, was wanting to Marcus Aurelius for punishing, as he did, the propagation of Christianity. No Christian more firmly believes that Atheism is false, and

tends to the dissolution of society, than Marcus Aurelius believed the same things of Christianity; he who, of all men then living, might have been thought the most capable of appreciating it. Unless any one who approves of punishment for the promulgation of opinions, flatters himself that he is a wiser and better man than Marcus Aurelius -- more deeply versed in the wisdom of his time, more elevated in his intellect above it -- more earnest in his search for truth, or more single-minded in his devotion to it when found; -- let him abstain from that assumption of the joint infallibility of himself and the multitude, which the great Antoninus made with so unfortunate a result.

Aware of the impossibility of defending the use of punishment for restraining irreligious opinions, by any argument which will not justify Marcus Antoninus, the enemies of religious freedom, when hard pressed, occasionally accept this consequence, and say, with Dr. Johnson, that the persecutors of Christianity were in the right; that persecution is an ordeal through which truth ought to pass, and always passes successfully, legal penalties being, in the end, powerless against truth, though sometimes beneficially effective against mischievous errors. This is a form of the argument for religious intolerance, sufficiently remarkable not to be passed without notice.

A theory which maintains that truth may justifiably be persecuted because persecution cannot possibly do it any harm, cannot be charged with being intentionally hostile to the reception of new truths; but we cannot commend the generosity of its dealing with the persons to whom mankind are indebted for them. To discover to the world something which deeply concerns it, and of which it was previously ignorant; to prove to it that it had been mistaken on some vital point of temporal or spiritual interest, is as important a service as a human being can render to his fellow-creatures, and in certain cases, as in those of the early Christians and of the Reformers, those who think with Dr. Johnson believe it to have been the most precious gift which could be bestowed on mankind. That the authors of such splendid benefits should be requited by martyrdom; that their reward should be to be dealt with as the vilest of criminals, is not, upon this theory, a deplorable error and misfortune, for which humanity should mourn in sackcloth and ashes, but the normal and justifiable state of things. The propounder of a new truth, according to this doctrine, should stand, as stood, in the legislation of the Locrians, the proposer of a new law, with a halter round his neck, to be instantly tightened if the public assembly did not, on hearing his reasons, then and there adopt his proposition. People who defend this mode of treating benefactors, can not be supposed to set much value on the benefit; and I believe this view of the subject is mostly confined to the sort of persons who think that new truths may have been desirable once, but that we have had enough of them now.

But, indeed, the dictum that truth always triumphs over persecution, is one of those pleasant falsehoods which men repeat after one another till they pass into commonplaces, but which all experience refutes. History teems with instances of truth put down by persecution. If not

suppressed forever, it may be thrown back for centuries. To speak only of religious opinions: the Reformation broke out at least twenty times before Luther, and was put down. Arnold of Brescia was put down. Fra Dolcino was put down. Savonarola was put down. The Albigeois were put down. The Vaudois were put down. The Lollards were put down. The Hussites were put down. Even after the era of Luther, wherever persecution was persisted in, it was successful. In Spain, Italy, Flanders, the Austrian empire, Protestantism was rooted out; and, most likely, would have been so in England, had Queen Mary lived, or Queen Elizabeth died. Persecution has always succeeded, save where the heretics were too strong a party to be effectually persecuted. No reasonable person can doubt that Christianity might have been extirpated in the Roman empire. It spread, and became predominant, because the persecutions were only occasional, lasting but a short time, and separated by long intervals of almost undisturbed propagandism. It is a piece of idle sentimentality that truth, merely as truth, has any inherent power denied to error, of prevailing against the dungeon and the stake. Men are not more zealous for truth than they often are for error, and a sufficient application of legal or even of social penalties will generally succeed in stopping the propagation of either. The real advantage which truth has, consists in this, that when an opinion is true, it may be extinguished once, twice, or many times, but in the course of ages there will generally be found persons to rediscover it, until some one of its reappearances falls on a time when from favourable circumstances it escapes persecution until it has made such head as to withstand all subsequent attempts to suppress it.

It will be said, that we do not now put to death the introducers of new opinions: we are not like our fathers who slew the prophets, we even build sepulchres to them. It is true we no longer put heretics to death; and the amount of penal infliction which modern feeling would probably tolerate, even against the most obnoxious opinions, is not sufficient to extirpate them. But let us not flatter ourselves that we are yet free from the stain even of legal persecution. Penalties for opinion, or at least for its expression, still exist by law; and their enforcement is not, even in these times, so unexampled as to make it at all incredible that they may some day be revived in full force. In the year 1857, at the summer assizes of the county of Cornwall, an unfortunate man,[2] said to be of unexceptionable conduct in all relations of life, was sentenced to twenty-one months imprisonment, for uttering, and writing on a gate, some offensive words concerning Christianity. Within a month of the same time, at the Old Bailey, two persons, on two separate occasions,[3] were rejected as jurymen, and one of them grossly insulted by the judge and one of the counsel, because they honestly declared that they had no theological belief; and a third, a foreigner,[4] for the same reason, was denied justice against a thief. This refusal of redress took place in virtue of the legal doctrine, that no person can be allowed to give evidence in a court of justice, who does not profess belief in a God (any god is sufficient) and in a future state; which is equivalent to declaring such persons to be outlaws, excluded from the protection of the tribunals; who

may not only be robbed or assaulted with impunity, if no one but themselves, or persons of similar opinions, be present, but any one else may be robbed or assaulted with impunity, if the proof of the fact depends on their evidence. The assumption on which this is grounded, is that the oath is worthless, of a person who does not believe in a future state; a proposition which betokens much ignorance of history in those who assent to it (since it is historically true that a large proportion of infidels in all ages have been persons of distinguished integrity and honor); and would be maintained by no one who had the smallest conception how many of the persons in greatest repute with the world, both for virtues and for attainments, are well known, at least to their intimates, to be unbelievers. The rule, besides, is suicidal, and cuts away its own foundation. Under pretence that atheists must be liars, it admits the testimony of all atheists who are willing to lie, and rejects only those who brave the obloquy of publicly confessing a detested creed rather than affirm a falsehood. A rule thus self-convicted of absurdity so far as regards its professed purpose, can be kept in force only as a badge of hatred, a relic of persecution; a persecution, too, having the peculiarity that the qualification for undergoing it is the being clearly proved not to deserve it. The rule, and the theory it implies, are hardly less insulting to believers than to infidels. For if he who does not believe in a future state necessarily lies, it follows that they who do believe are only prevented from lying, if prevented they are, by the fear of hell. We will not do the authors and abettors of the rule the injury of supposing, that the conception which they have formed of Christian virtue is drawn from their own consciousness.

These, indeed, are but rags and remnants of persecution, and may be thought to be not so much an indication of the wish to persecute, as an example of that very frequent infirmity of English minds, which makes them take a preposterous pleasure in the assertion of a bad principle, when they are no longer bad enough to desire to carry it really into practice. But unhappily there is no security in the state of the public mind, that the suspension of worse forms of legal persecution, which has lasted for about the space of a generation, will continue. In this age the quiet surface of routine is as often ruffled by attempts to resuscitate past evils, as to introduce new benefits. What is boasted of at the present time as the revival of religion, is always, in narrow and uncultivated minds, at least as much the revival of bigotry; and where there is the strongest permanent leaven of intolerance in the feelings of a people, which at all times abides in the middle classes of this country, it needs but little to provoke them into actively persecuting those whom they have never ceased to think proper objects of persecution.[5] For it is this -- it is the opinions men entertain, and the feelings they cherish, respecting those who disown the beliefs they deem important, which makes this country not a place of mental freedom. For a long time past, the chief mischief of the legal penalties is that they strengthen the social stigma. It is that stigma which is really effective, and so effective is it, that the profession of opinions which are under the ban of society is much less common in

England, than is, in many other countries, the avowal of those which incur risk of judicial punishment. In respect to all persons but those whose pecuniary circumstances make them independent of the good will of other people, opinion, on this subject, is as efficacious as law; men might as well be imprisoned, as excluded from the means of earning their bread. Those whose bread is already secured, and who desire no favors from men in power, or from bodies of men, or from the public, have nothing to fear from the open avowal of any opinions, but to be ill-thought of and illspoken of, and this it ought not to require a very heroic mould to enable them to bear. There is no room for any appeal ad misericordiam in behalf of such persons. But though we do not now inflict so much evil on those who think differently from us, as it was formerly our custom to do, it may be that we do ourselves as much evil as ever by our treatment of them. Socrates was put to death, but the Socratic philosophy rose like the sun in heaven, and spread its illumination over the whole intellectual firmament. Christians were cast to the lions, but the Christian Church grew up a stately and spreading tree, overtopping the older and less vigorous growths, and stifling them by its shade. Our merely social intolerance, kills no one, roots out no opinions, but induces men to disguise them, or to abstain from any active effort for their diffusion. With us, heretical opinions do not perceptibly gain or even lose, ground in each decade or generation; they never blaze out far and wide, but continue to smoulder in the narrow circles of thinking and studious persons among whom they originate, without ever lighting up the general affairs of mankind with either a true or a deceptive light. And thus is kept up a state of things very satisfactory to some minds, because, without the unpleasant process of fining or imprisoning anybody, it maintains all prevailing opinions outwardly undisturbed, while it does not absolutely interdict the exercise of reason by dissentients afflicted with the malady of thought. A convenient plan for having peace in the intellectual world, and keeping all things going on therein very much as they do already. But the price paid for this sort of intellectual pacification, is the sacrifice of the entire moral courage of the human mind. A state of things in which a large portion of the most active and inquiring intellects find it advisable to keep the genuine principles and grounds of their convictions within their own breasts, and attempt, in what they address to the public, to fit as much as they can of their own conclusions to premises which they have internally renounced, cannot send forth the open, fearless characters, and logical, consistent intellects who once adorned the thinking world. The sort of men who can be looked for under it, are either mere conformers to commonplace, or time-servers for truth whose arguments on all great subjects are meant for their hearers, and are not those which have convinced themselves. Those who avoid this alternative, do so by narrowing their thoughts and interests to things which can be spoken of without venturing within the region of principles, that is, to small practical matters, which would come right of themselves, if but the minds of mankind were strengthened and enlarged, and which will never be made effectually right until then; while that which would strengthen and enlarge men's minds, free and daring speculation on the highest subjects, is abandoned.

Those in whose eyes this reticence on the part of heretics is no evil, should consider in the first place, that in consequence of it there is never any fair and thorough discussion of heretical opinions; and that such of them as could not stand such a discussion, though they may be prevented from spreading, do not disappear. But it is not the minds of heretics that are deteriorated most, by the ban placed on all inquiry which does not end in the orthodox conclusions. The greatest harm done is to those who are not heretics, and whose whole mental development is cramped, and their reason cowed, by the fear of heresy. Who can compute what the world loses in the multitude of promising intellects combined with timid characters, who dare not follow out any bold, vigorous, independent train of thought, lest it should land them in something which would admit of being considered irreligious or immoral? Among them we may occasionally see some man of deep conscientiousness, and subtile and refined understanding, who spends a life in sophisticating with an intellect which he cannot silence, and exhausts the resources of ingenuity in attempting to reconcile the promptings of his conscience and reason with orthodoxy, which yet he does not, perhaps, to the end succeed in doing. No one can be a great thinker who does not recognize, that as a thinker it is his first duty to follow his intellect to whatever conclusions it may lead. Truth gains more even by the errors of one who, with due study and preparation, thinks for himself, than by the true opinions of those who only hold them because they do not suffer themselves to think. Not that it is solely, or chiefly, to form great thinkers, that freedom of thinking is required. On the contrary, it is as much, and even more indispensable, to enable average human beings to attain the mental stature which they are capable of. There have been, and may again be, great individual thinkers, in a general atmosphere of mental slavery. But there never has been, nor ever will be, in that atmosphere, an intellectually active people. Where any people has made a temporary approach to such a character, it has been because the dread of heterodox speculation was for a time suspended. Where there is a tacit convention that principles are not to be disputed; where the discussion of the greatest questions which can occupy humanity is considered to be closed, we cannot hope to find that generally high scale of mental activity which has made some periods of history so remarkable. Never when controversy avoided the subjects which are large and important enough to kindle enthusiasm, was the mind of a people stirred up from its foundations, and the impulse given which raised even persons of the most ordinary intellect to something of the dignity of thinking beings. Of such we have had an example in the condition of Europe during the times immediately following the Reformation; another, though limited to the Continent and to a more cultivated class, in the speculative movement of the latter half of the eighteenth century; and a third, of still briefer duration, in the intellectual fermentation of Germany during the Goethian and Fichtean period. These periods differed widely in the particular opinions which they developed; but were alike in this, that during all three the yoke of authority was broken. In each, an old mental despotism had been thrown off, and no new one had yet

taken its place. The impulse given at these three periods has made Europe what it now is. Every single improvement which has taken place either in the human mind or in institutions, may be traced distinctly to one or other of them. Appearances have for some time indicated that all three impulses are well-nigh spent; and we can expect no fresh start, until we again assert our mental freedom.

Let us now pass to the second division of the argument, and dismissing the Supposition that any of the received opinions may be false, let us assume them to be true, and examine into the worth of the manner in which they are likely to be held, when their truth is not freely and openly canvassed. However unwillingly a person who has a strong opinion may admit the possibility that his opinion may be false, he ought to be moved by the consideration that however true it may be, if it is not fully, frequently, and fearlessly discussed, it will be held as a dead dogma, not a living truth.

There is a class of persons (happily not quite so numerous as formerly) who think it enough if a person assents undoubtingly to what they think true, though he has no knowledge whatever of the grounds of the opinion, and could not make a tenable defence of it against the most superficial objections. Such persons, if they can once get their creed taught from authority, naturally think that no good, and some harm, comes of its being allowed to be questioned. Where their influence prevails, they make it nearly impossible for the received opinion to be rejected wisely and considerately, though it may still be rejected rashly and ignorantly; for to shut out discussion entirely is seldom possible, and when it once gets in, beliefs not grounded on conviction are apt to give way before the slightest semblance of an argument. Waiving, however, this possibility -- assuming that the true opinion abides in the mind, but abides as a prejudice, a belief independent of, and proof against, argument -- this is not the way in which truth ought to be held by a rational being. This is not knowing the truth. Truth, thus held, is but one superstition the more, accidentally clinging to the words which enunciate a truth.

If the intellect and judgment of mankind ought to be cultivated, a thing which Protestants at least do not deny, on what can these faculties be more appropriately exercised by any one, than on the things which concern him so much that it is considered necessary for him to hold opinions on them? If the cultivation of the understanding consists in one thing more than in another, it is surely in learning the grounds of one's own opinions. Whatever people believe, on subjects on which it is of the first importance to believe rightly, they ought to be able to defend against at least the common objections. But, some one may say, "Let them be taught the grounds of their opinions. It does not follow that opinions must be merely parroted because they are never heard controverted. Persons who learn geometry do not simply commit the theorems to memory, but understand and learn likewise the demonstrations; and it would be absurd to say that they remain ignorant of the grounds of geometrical truths, because they never hear any one deny, and attempt to

disprove them." Undoubtedly: and such teaching suffices on a subject like mathematics, where there is nothing at all to be said on the wrong side of the question. The peculiarity of the evidence of mathematical truths is, that all the argument is on one side. There are no objections, and no answers to objections. But on every subject on which difference of opinion is possible, the truth depends on a balance to be struck between two sets of conflicting reasons. Even in natural philosophy, there is always some other explanation possible of the same facts; some geocentric theory instead of heliocentric, some phlogiston instead of oxygen; and it has to be shown why that other theory cannot be the true one: and until this is shown and until we know how it is shown, we do not understand the grounds of our opinion. But when we turn to subjects infinitely more complicated, to morals, religion, politics, social relations, and the business of life, three-fourths of the arguments for every disputed opinion consist in dispelling the appearances which favor some opinion different from it. The greatest orator, save one, of antiquity, has left it on record that he always studied his adversary's case with as great, if not with still greater, intensity than even his own. What Cicero practised as the means of forensic success, requires to be imitated by all who study any subject in order to arrive at the truth. He who knows only his own side of the case, knows little of that. His reasons may be good, and no one may have been able to refute them. But if he is equally unable to refute the reasons on the opposite side; if he does not so much as know what they are, he has no ground for preferring either opinion. The rational position for him would be suspension of judgment, and unless he contents himself with that, he is either led by authority, or adopts, like the generality of the world, the side to which he feels most inclination. Nor is it enough that he should hear the arguments of adversaries from his own teachers, presented as they state them, and accompanied by what they offer as refutations. This is not the way to do justice to the arguments, or bring them into real contact with his own mind. He must be able to hear them from persons who actually believe them; who defend them in earnest, and do their very utmost for them. He must know them in their most plausible and persuasive form; he must feel the whole force of the difficulty which the true view of the subject has to encounter and dispose of, else he will never really possess himself of the portion of truth which meets and removes that difficulty. Ninety-nine in a hundred of what are called educated men are in this condition, even of those who can argue fluently for their opinions. Their conclusion may be true, but it might be false for anything they know: they have never thrown themselves into the mental position of those who think differently from them, and considered what such persons may have to say; and consequently they do not, in any proper sense of the word, know the doctrine which they themselves profess. They do not know those parts of it which explain and justify the remainder; the considerations which show that a fact which seemingly conflicts with another is reconcilable with it, or that, of two apparently strong reasons, one and not the other ought to be preferred. All that part of the truth which turns the scale, and decides the judgment of a completely informed mind, they are

strangers to; nor is it ever really known, but to those who have attended equally and impartially to both sides, and endeavored to see the reasons of both in the strongest light. So essential is this discipline to a real understanding of moral and human subjects, that if opponents of all important truths do not exist, it is indispensable to imagine them and supply them with the strongest arguments which the most skilful devil's advocate can conjure up.

To abate the force of these considerations, an enemy of free discussion may be supposed to say, that there is no necessity for mankind in general to know and understand all that can be said against or for their opinions by philosophers and theologians. That it is not needful for common men to be able to expose all the misstatements or fallacies of an ingenious opponent. That it is enough if there is always somebody capable of answering them, so that nothing likely to mislead uninstructed persons remains unrefuted. That simple minds, having been taught the obvious grounds of the truths inculcated on them, may trust to authority for the rest, and being aware that they have neither knowledge nor talent to resolve every difficulty which can be raised, may repose in the assurance that all those which have been raised have been or can be answered, by those who are specially trained to the task.

Conceding to this view of the subject the utmost that can be claimed for it by those most easily satisfied with the amount of understanding of truth which ought to accompany the belief of it; even so, the argument for free discussion is no way weakened. For even this doctrine acknowledges that mankind ought to have a rational assurance that all objections have been satisfactorily answered; and how are they to be answered if that which requires to be answered is not spoken? or how can the answer be known to be satisfactory, if the objectors have no opportunity of showing that it is unsatisfactory? If not the public, at least the philosophers and theologians who are to resolve the difficulties, must make themselves familiar with those difficulties in their most puzzling form; and this cannot be accomplished unless they are freely stated, and placed in the most advantageous light which they admit of. The Catholic Church has its own way of dealing with this embarrassing problem. It makes a broad separation between those who can be permitted to receive its doctrines on conviction, and those who must accept them on trust. Neither, indeed, are allowed any choice as to what they will accept; but the clergy, such at least as can be fully confided in, may admissibly and meritoriously make themselves acquainted with the arguments of opponents, in order to answer them, and may, therefore, read heretical books; the laity, not unless by special permission, hard to be obtained. This discipline recognizes a knowledge of the enemy's case as beneficial to the teachers, but finds means, consistent with this, of denying it to the rest of the world: thus giving to the elite more mental culture, though not more mental freedom, than it allows to the mass. By this device it succeeds in obtaining the kind of mental superiority which its purposes require; for though culture without freedom never made a large and liberal mind, it can make a clever nisi prius advocate of a cause. But in

countries professing Protestantism, this resource is denied; since Protestants hold, at least in theory, that the responsibility for the choice of a religion must be borne by each for himself, and cannot be thrown off upon teachers. Besides, in the present state of the world, it is practically impossible that writings which are read by the instructed can be kept from the uninstructed. If the teachers of mankind are to be cognizant of all that they ought to know, everything must be free to be written and published without restraint.

If, however, the mischievous operation of the absence of free discussion, when the received opinions are true, were confined to leaving men ignorant of the grounds of those opinions, it might be thought that this, if an intellectual, is no moral evil, and does not affect the worth of the opinions, regarded in their influence on the character. The fact, however, is, that not only the grounds of the opinion are forgotten in the absence of discussion, but too often the meaning of the opinion itself. The words which convey it, cease to suggest ideas, or suggest only a small portion of those they were originally employed to communicate. Instead of a vivid conception and a living belief, there remain only a few phrases retained by rote; or, if any part, the shell and husk only of the meaning is retained, the finer essence being lost. The great chapter in human history which this fact occupies and fills, cannot be too earnestly studied and meditated on.

It is illustrated in the experience of almost all ethical doctrines and religious creeds. They are all full of meaning and vitality to those who originate them, and to the direct disciples of the originators. Their meaning continues to be felt in undiminished strength, and is perhaps brought out into even fuller consciousness, so long as the struggle lasts to give the doctrine or creed an ascendency over other creeds. At last it either prevails, and becomes the general opinion, or its progress stops; it keeps possession of the ground it has gained, but ceases to spread further. When either of these results has become apparent, controversy on the subject flags, and gradually dies away. The doctrine has taken its place, if not as a received opinion, as one of the admitted sects or divisions of opinion: those who hold it have generally inherited, not adopted it; and conversion from one of these doctrines to another, being now an exceptional fact, occupies little place in the thoughts of their professors. Instead of being, as at first, constantly on the alert either to defend themselves against the world, or to bring the world over to them, they have subsided into acquiescence, and neither listen, when they can help it, to arguments against their creed, nor trouble dissentients (if there be such) with arguments in its favor. From this time may usually be dated the decline in the living power of the doctrine. We often hear the teachers of all creeds lamenting the difficulty of keeping up in the minds of believers a lively apprehension of the truth which they nominally recognize, so that it may penetrate the feelings, and acquire a real mastery over the conduct. No such difficulty is complained of while the creed is still fighting for its existence: even the weaker combatants then know and feel what they are fighting for, and the difference between it

and other doctrines; and in that period of every creed's existence, not a few persons may be found, who have realized its fundamental principles in all the forms of thought, have weighed and considered them in all their important bearings, and have experienced the full effect on the character, which belief in that creed ought to produce in a mind thoroughly imbued with it. But when it has come to be an hereditary creed, and to be received passively, not actively -- when the mind is no longer compelled, in the same degree as at first, to exercise its vital powers on the questions which its belief presents to it, there is a progressive tendency to forget all of the belief except the formularies, or to give it a dull and torpid assent, as if accepting it on trust dispensed with the necessity of realizing it in consciousness, or testing it by personal experience; until it almost ceases to connect itself at all with the inner life of the human being. Then are seen the cases, so frequent in this age of the world as almost to form the majority, in which the creed remains as it were outside the mind, encrusting and petrifying it against all other influences addressed to the higher parts of our nature; manifesting its power by not suffering any fresh and living conviction to get in, but itself doing nothing for the mind or heart, except standing sentinel over them to keep them vacant.

To what an extent doctrines intrinsically fitted to make the deepest impression upon the mind may remain in it as dead beliefs, without being ever realized in the imagination, the feelings, or the understanding, is exemplified by the manner in which the majority of believers hold the doctrines of Christianity. By Christianity I here mean what is accounted such by all churches and sects -- the maxims and precepts contained in the New Testament. These are considered sacred, and accepted as laws, by all professing Christians. Yet it is scarcely too much to say that not one Christian in a thousand guides or tests his individual conduct by reference to those laws. The standard to which he does refer it, is the custom of his nation, his class, or his religious profession. He has thus, on the one hand, a collection of ethical maxims, which he believes to have been vouchsafed to him by infallible wisdom as rules for his government; and on the other, a set of every-day judgments and practices, which go a certain length with some of those maxims, not so great a length with others, stand in direct opposition to some, and are, on the whole, a compromise between the Christian creed and the interests and suggestions of worldly life. To the first of these standards he gives his homage; to the other his real allegiance. All Christians believe that the blessed are the poor and humble, and those who are illused by the world; that it is easier for a camel to pass through the eye of a needle than for a rich man to enter the kingdom of heaven; that they should judge not, lest they be judged; that they should swear not at all; that they should love their neighbor as themselves; that if one take their cloak, they should give him their coat also; that they should take no thought for the morrow; that if they would be perfect, they should sell all that they have and give it to the poor. They are not insincere when they say that they believe these things. They do believe them, as people believe what they have always heard

lauded and never discussed. But in the sense of that living belief which regulates conduct, they believe these doctrines just up to the point to which it is usual to act upon them. The doctrines in their integrity are serviceable to pelt adversaries with; and it is understood that they are to be put forward (when possible) as the reasons for whatever people do that they think laudable. But any one who reminded them that the maxims require an infinity of things which they never even think of doing would gain nothing but to be classed among those very unpopular characters who affect to be better than other people. The doctrines have no hold on ordinary believers -- are not a power in their minds. They have an habitual respect for the sound of them, but no feeling which spreads from the words to the things signified, and forces the mind to take them in, and make them conform to the formula. Whenever conduct is concerned, they look round for Mr. A and B to direct them how far to go in obeying Christ.

Now we may be well assured that the case was not thus, but far otherwise, with the early Christians. Had it been thus, Christianity never would have expanded from an obscure sect of the despised Hebrews into the religion of the Roman empire. When their enemies said, "See how these Christians love one another" (a remark not likely to be made by anybody now), they assuredly had a much livelier feeling of the meaning of their creed than they have ever had since. And to this cause, probably, it is chiefly owing that Christianity now makes so little progress in extending its domain, and after eighteen centuries, is still nearly confined to Europeans and the descendants of Europeans. Even with the strictly religious, who are much in earnest about their doctrines, and attach a greater amount of meaning to many of them than people in general, it commonly happens that the part which is thus comparatively active in their minds is that which was made by Calvin, or Knox, or some such person much nearer in character to themselves. The sayings of Christ coexist passively in their minds, producing hardly any effect beyond what is caused by mere listening to words so amiable and bland. There are many reasons, doubtless, why doctrines which are the badge of a sect retain more of their vitality than those common to all recognized sects, and why more pains are taken by teachers to keep their meaning alive; but one reason certainly is, that the peculiar doctrines are more questioned, and have to be oftener defended against open gainsayers. Both teachers and learners go to sleep at their post, as soon as there is no enemy in the field.

The same thing holds true, generally speaking, of all traditional doctrines -- those of prudence and knowledge of life, as well as of morals or religion. All languages and literatures are full of general observations on life, both as to what it is, and how to conduct oneself in it; observations which everybody knows, which everybody repeats, or hears with acquiescence, which are received as truisms, yet of which most people first truly learn the meaning, when experience, generally of a painful kind, has made it a reality to them. How often, when smarting under some unforeseen misfortune or disappointment, does a person call to mind some proverb or common saying familiar to him all

his life, the meaning of which, if he had ever before felt it as he does now, would have saved him from the calamity. There are indeed reasons for this, other than the absence of discussion: there are many truths of which the full meaning cannot be realized, until personal experience has brought it home. But much more of the meaning even of these would have been understood, and what was understood would have been far more deeply impressed on the mind, if the man had been accustomed to hear it argued pro and con by people who did understand it. The fatal tendency of mankind to leave off thinking about a thing when it is no longer doubtful, is the cause of half their errors. A contemporary author has well spoken of "the deep slumber of a decided opinion."

But what! (it may be asked) Is the absence of unanimity an indispensable condition of true knowledge? Is it necessary that some part of mankind should persist in error, to enable any to realize the truth? Does a belief cease to be real and vital as soon as it is generally received -- and is a proposition never thoroughly understood and felt unless some doubt of it remains? As soon as mankind have unanimously accepted a truth, does the truth perish within them? The highest aim and best result of improved intelligence, it has hitherto been thought, is to unite mankind more and more in the acknowledgment of all important truths: and does the intelligence only last as long as it has not achieved its object? Do the fruits of conquest perish by the very completeness of the victory?

I affirm no such thing. As mankind improve, the number of doctrines which are no longer disputed or doubted will be constantly on the increase: and the well-being of mankind may almost be measured by the number and gravity of the truths which have reached the point of being uncontested. The cessation, on one question after another, of serious controversy, is one of the necessary incidents of the consolidation of opinion; a consolidation as salutary in the case of true opinions, as it is dangerous and noxious when the opinions are erroneous. But though this gradual narrowing of the bounds of diversity of opinion is necessary in both senses of the term, being at once inevitable and indispensable, we are not therefore obliged to conclude that all its consequences must be beneficial. The loss of so important an aid to the intelligent and living apprehension of a truth, as is afforded by the necessity of explaining it to, or defending it against, opponents, though not sufficient to outweigh, is no trifling drawback from, the benefit of its universal recognition. Where this advantage can no longer be had, I confess I should like to see the teachers of mankind endeavoring to provide a substitute for it; some contrivance for making the difficulties of the question as present to the learner's consciousness, as if they were pressed upon him by a dissentient champion, eager for his conversion.

But instead of seeking contrivances for this purpose, they have lost those they formerly had. The Socratic dialectics, so magnificently exemplified in the dialogues of Plato, were a contrivance of this description. They were essentially a negative discussion of the great questions of philosophy and life, directed with consummate skill to the

purpose of convincing any one who had merely adopted the commonplaces of received opinion, that he did not understand the subject -- that he as yet attached no definite meaning to the doctrines he professed; in order that, becoming aware of his ignorance, he might be put in the way to attain a stable belief, resting on a clear apprehension both of the meaning of doctrines and of their evidence. The school disputations of the Middle Ages had a somewhat similar object. They were intended to make sure that the pupil understood his own opinion, and (by necessary correlation) the opinion opposed to it, and could enforce the grounds of the one and confute those of the other. These last-mentioned contests had indeed the incurable defect, that the premises appealed to were taken from authority, not from reason; and, as a discipline to the mind, they were in every respect inferior to the powerful dialectics which formed the intellects of the "Socratici viri:" but the modern mind owes far more to both than it is generally willing to admit, and the present modes of education contain nothing which in the smallest degree supplies the place either of the one or of the other. A person who derives all his instruction from teachers or books, even if he escape the besetting temptation of contenting himself with cram, is under no compulsion to hear both sides; accordingly it is far from a frequent accomplishment, even among thinkers, to know both sides; and the weakest part of what everybody says in defence of his opinion, is what he intends as a reply to antagonists. It is the fashion of the present time to disparage negative logic -- that which points out weaknesses in theory or errors in practice, without establishing positive truths. Such negative criticism would indeed be poor enough as an ultimate result; but as a means to attaining any positive knowledge or conviction worthy the name, it cannot be valued too highly; and until people are again systematically trained to it, there will be few great thinkers, and a low general average of intellect, in any but the mathematical and physical departments of speculation. On any other subject no one's opinions deserve the name of knowledge, except so far as he has either had forced upon him by others, or gone through of himself, the same mental process which would have been required of him in carrying on an active controversy with opponents. That, therefore, which when absent, it is so indispensable, but so difficult, to create, how worse than absurd is it to forego, when spontaneously offering itself! If there are any persons who contest a received opinion, or who will do so if law or opinion will let them, let us thank them for it, open our minds to listen to them, and rejoice that there is some one to do for us what we otherwise ought, if we have any regard for either the certainty or the vitality of our convictions, to do with much greater labor for ourselves.

It still remains to speak of one of the principal causes which make diversity of opinion advantageous, and will continue to do so until mankind shall have entered a stage of intellectual advancement which at present seems at an incalculable distance. We have hitherto considered only two possibilities: that the received opinion may be false, and some other opinion, consequently, true; or that, the received opinion being true, a conflict with the opposite error is essential to a clear apprehension and deep feeling

of its truth. But there is a commoner case than either of these; when the conflicting doctrines, instead of being one true and the other false, share the truth between them; and the nonconforming opinion is needed to supply the remainder of the truth, of which the received doctrine embodies only a part. Popular opinions, on subjects not palpable to sense, are often true, but seldom or never the whole truth. They are a part of the truth; sometimes a greater, sometimes a smaller part, but exaggerated, distorted, and disjoined from the truths by which they ought to be accompanied and limited. Heretical opinions, on the other hand, are generally some of these suppressed and neglected truths, bursting the bonds which kept them down, and either seeking reconciliation with the truth contained in the common opinion, or fronting it as enemies, and setting themselves up, with similar exclusiveness, as the whole truth. The latter case is hitherto the most frequent, as, in the human mind, one-sidedness has always been the rule, and many-sidedness the exception. Hence, even in revolutions of opinion, one part of the truth usually sets while another rises. Even progress, which ought to superadd, for the most part only substitutes one partial and incomplete truth for another; improvement consisting chiefly in this, that the new fragment of truth is more wanted, more adapted to the needs of the time, than that which it displaces. Such being the partial character of prevailing opinions, even when resting on a true foundation; every opinion which embodies somewhat of the portion of truth which the common opinion omits, ought to be considered precious, with whatever amount of error and confusion that truth may be blended. No sober judge of human affairs will feel bound to be indignant because those who force on our notice truths which we should otherwise have overlooked, overlook some of those which we see. Rather, he will think that so long as popular truth is one-sided, it is more desirable than otherwise that unpopular truth should have one-sided asserters too; such being usually the most energetic, and the most likely to compel reluctant attention to the fragment of wisdom which they proclaim as if it were the whole.

Thus, in the eighteenth century, when nearly all the instructed, and all those of the uninstructed who were led by them, were lost in admiration of what is called civilization, and of the marvels of modern science, literature, and philosophy, and while greatly overrating the amount of unlikeness between the men of modern and those of ancient times, indulged the belief that the whole of the difference was in their own favor; with what a salutary shock did the paradoxes of Rousseau explode like bombshells in the midst, dislocating the compact mass of one-sided opinion, and forcing its elements to recombine in a better form and with additional ingredients. Not that the current opinions were on the whole farther from the truth than Rousseau's were; on the contrary, they were nearer to it; they contained more of positive truth, and very much less of error. Nevertheless there lay in Rousseau's doctrine, and has floated down the stream of opinion along with it, a considerable amount of exactly those truths which the popular opinion wanted; and these are the deposit which was left behind when the flood subsided. The superior worth of simplicity of life, the enervating and demoralizing effect

of the trammels and hypocrisies of artificial society, are ideas which have never been entirely absent from cultivated minds since Rousseau wrote; and they will in time produce their due effect, though at present needing to be asserted as much as ever, and to be asserted by deeds, for words, on this subject, have nearly exhausted their power.

In politics, again, it is almost a commonplace, that a party of order or stability, and a party of progress or reform, are both necessary elements of a healthy state of political life; until the one or the other shall have so enlarged its mental grasp as to be a party equally of order and of progress, knowing and distinguishing what is fit to be preserved from what ought to be swept away. Each of these modes of thinking derives its utility from the deficiencies of the other; but it is in a great measure the opposition of the other that keeps each within the limits of reason and sanity. Unless opinions favorable to democracy and to aristocracy, to property and to equality, to co-operation and to competition, to luxury and to abstinence, to sociality and individuality, to liberty and discipline, and all the other standing antagonisms of practical life, are expressed with equal freedom, and enforced and defended with equal talent and energy, there is no chance of both elements obtaining their due; one scale is sure to go up, and the other down. Truth, in the great practical concerns of life, is so much a question of the reconciling and combining of opposites, that very few have minds sufficiently capacious and impartial to make the adjustment with an approach to correctness, and it has to be made by the rough process of a struggle between combatants fighting under hostile banners. On any of the great open questions just enumerated, if either of the two opinions has a better claim than the other, not merely to be tolerated, but to be encouraged and countenanced, it is the one which happens at the particular time and place to be in a minority. That is the opinion which, for the time being, represents the neglected interests, the side of human well-being which is in danger of obtaining less than its share. I am aware that there is not, in this country, any intolerance of differences of opinion on most of these topics. They are adduced to show, by admitted and multiplied examples, the universality of the fact, that only through diversity of opinion is there, in the existing state of human intellect, a chance of fair play to all sides of the truth. When there are persons to be found, who form an exception to the apparent unanimity of the world on any subject, even if the world is in the right, it is always probable that dissentients have something worth hearing to say for themselves, and that truth would lose something by their silence.

It may be objected, "But some received principles, especially on the highest and most vital subjects, are more than half-truths. The Christian morality, for instance, is the whole truth on that subject and if any one teaches a morality which varies from it, he is wholly in error." As this is of all cases the most important in practice, none can be fitter to test the general maxim. But before pronouncing what Christian morality is or is not, it would be desirable to decide what is meant by Christian morality. If it means the morality of the New Testament, I wonder that

any one who derives his knowledge of this from the book itself, can suppose that it was announced, or intended, as a complete doctrine of morals. The Gospel always refers to a preexisting morality, and confines its precepts to the particulars in which that morality was to be corrected, or superseded by a wider and higher; expressing itself, moreover, in terms most general, often impossible to be interpreted literally, and possessing rather the impressiveness of poetry or eloquence than the precision of legislation. To extract from it a body of ethical doctrine, has never been possible without eking it out from the Old Testament, that is, from a system elaborate indeed, but in many respects barbarous, and intended only for a barbarous people. St. Paul, a declared enemy to this Judaical mode of interpreting the doctrine and filling up the scheme of his Master, equally assumes a preexisting morality, namely, that of the Greeks and Romans; and his advice to Christians is in a great measure a system of accommodation to that; even to the extent of giving an apparent sanction to slavery. What is called Christian, but should rather be termed theological, morality, was not the work of Christ or the Apostles, but is of much later origin, having been gradually built up by the Catholic Church of the first five centuries, and though not implicitly adopted by moderns and Protestants, has been much less modified by them than might have been expected. For the most part, indeed, they have contented themselves with cutting off the additions which had been made to it in the Middle Ages, each sect supplying the place by fresh additions, adapted to its own character and tendencies. That mankind owe a great debt to this morality, and to its early teachers, I should be the last person to deny; but I do not scruple to say of it, that it is, in many important points, incomplete and one-sided, and that unless ideas and feelings, not sanctioned by it, had contributed to the formation of European life and character, human affairs would have been in a worse condition than they now are. Christian morality (so called) has all the characters of a reaction; it is, in great part, a protest against Paganism. Its ideal is negative rather than positive; passive rather than active; Innocence rather than Nobleness; Abstinence from Evil, rather than energetic Pursuit of Good: in its precepts (as has been well said) "thou shalt not" predominates unduly over "thou shalt." In its horror of sensuality, it made an idol of asceticism, which has been gradually compromised away into one of legality. It holds out the hope of heaven and the threat of hell, as the appointed and appropriate motives to a virtuous life: in this falling far below the best of the ancients, and doing what lies in it to give to human morality an essentially selfish character, by disconnecting each man's feelings of duty from the interests of his fellow-creatures, except so far as a self-interested inducement is offered to him for consulting them. It is essentially a doctrine of passive obedience; it inculcates submission to all authorities found established; who indeed are not to be actively obeyed when they command what religion forbids, but who are not to be resisted, far less rebelled against, for any amount of wrong to ourselves. And while, in the morality of the best Pagan nations, duty to the State holds even a disproportionate place, infringing on the just liberty of the individual; in purely Christian ethics that grand

department of duty is scarcely noticed or acknowledged. It is in the Koran, not the New Testament, that we read the maxim -- "A ruler who appoints any man to an office, when there is in his dominions another man better qualified for it, sins against God and against the State." What little recognition the idea of obligation to the public obtains in modern morality, is derived from Greek and Roman sources, not from Christian; as, even in the morality of private life, whatever exists of magnanimity, high-mindedness, personal dignity, even the sense of honor, is derived from the purely human, not the religious part of our education, and never could have grown out of a standard of ethics in which the only worth, professedly recognized, is that of obedience.

I am as far as any one from pretending that these defects are necessarily inherent in the Christian ethics, in every manner in which it can be conceived, or that the many requisites of a complete moral doctrine which it does not contain, do not admit of being reconciled with it. Far less would I insinuate this of the doctrines and precepts of Christ himself. I believe that the sayings of Christ are all, that I can see any evidence of their having been intended to be; that they are irreconcilable with nothing which a comprehensive morality requires; that everything which is excellent in ethics may be brought within them, with no greater violence to their language than has been done to it by all who have attempted to deduce from them any practical system of conduct whatever. But it is quite consistent with this, to believe that they contain and were meant to contain, only a part of the truth; that many essential elements of the highest morality are among the things which are not provided for, nor intended to be provided for, in the recorded deliverances of the Founder of Christianity, and which have been entirely thrown aside in the system of ethics erected on the basis of those deliverances by the Christian Church. And this being so, I think it a great error to persist in attempting to find in the Christian doctrine that complete rule for our guidance, which its author intended it to sanction and enforce, but only partially to provide. I believe, too, that this narrow theory is becoming a grave practical evil, detracting greatly from the value of the moral training and instruction, which so many wellmeaning persons are now at length exerting themselves to promote. I much fear that by attempting to form the mind and feelings on an exclusively religious type, and discarding those secular standards (as for want of a better name they may be called) which heretofore coexisted with and supplemented the Christian ethics, receiving some of its spirit, and infusing into it some of theirs, there will result, and is even now resulting, a low, abject, servile type of character, which, submit itself as it may to what it deems the Supreme Will, is incapable of rising to or sympathizing in the conception of Supreme Goodness. I believe that other ethics than any one which can be evolved from exclusively Christian sources, must exist side by side with Christian ethics to produce the moral regeneration of mankind; and that the Christian system is no exception to the rule that in an imperfect state of the human mind, the interests of truth require a diversity of opinions. It is not necessary that in ceasing to ignore

the moral truths not contained in Christianity, men should ignore any of those which it does contain. Such prejudice, or oversight, when it occurs, is altogether an evil; but it is one from which we cannot hope to be always exempt, and must be regarded as the price paid for an inestimable good. The exclusive pretension made by a part of the truth to be the whole, must and ought to be protested against, and if a reactionary impulse should make the protestors unjust in their turn, this one-sidedness, like the other, may be lamented, but must be tolerated. If Christians would teach infidels to be just to Christianity, they should themselves be just to infidelity. It can do truth no service to blink the fact, known to all who have the most ordinary acquaintance with literary history, that a large portion of the noblest and most valuable moral teaching has been the work, not only of men who did not know, but of men who knew and rejected, the Christian faith.

I do not pretend that the most unlimited use of the freedom of enunciating all possible opinions would put an end to the evils of religious or philosophical sectarianism. Every truth which men of narrow capacity are in earnest about, is sure to be asserted, inculcated, and in many ways even acted on, as if no other truth existed in the world, or at all events none that could limit or qualify the first. I acknowledge that the tendency of all opinions to become sectarian is not cured by the freest discussion, but is often heightened and exacerbated thereby; the truth which ought to have been, but was not, seen, being rejected all the more violently because proclaimed by persons regarded as opponents. But it is not on the impassioned partisan, it is on the calmer and more disinterested bystander, that this collision of opinions works its salutary effect. Not the violent conflict between parts of the truth, but the quiet suppression of half of it, is the formidable evil: there is always hope when people are forced to listen to both sides; it is when they attend only to one that errors harden into prejudices, and truth itself ceases to have the effect of truth, by being exaggerated into falsehood. And since there are few mental attributes more rare than that judicial faculty which can sit in intelligent judgment between two sides of a question, of which only one is represented by an advocate before it, truth has no chance but in proportion as every side of it, every opinion which embodies any fraction of the truth, not only finds advocates, but is so advocated as to be listened to.

We have now recognized the necessity to the mental wellbeing of mankind (on which all their other well-being depends) of freedom of opinion, and freedom of the expression of opinion, on four distinct grounds; which we will now briefly recapitulate.

First, if any opinion is compelled to silence, that opinion may, for aught we can certainly know, be true. To deny this is to assume our own infallibility.

Secondly, though the silenced opinion be an error, it may, and very commonly does, contain a portion of truth; and since the general or prevailing opinion on any object is rarely or never the whole truth, it is only by the collision

of adverse opinions that the remainder of the truth has any chance of being supplied.

Thirdly, even if the received opinion be not only true, but the whole truth; unless it is suffered to be, and actually is, vigorously and earnestly contested, it will, by most of those who receive it, be held in the manner of a prejudice, with little comprehension or feeling of its rational grounds. And not only this, but, fourthly, the meaning of the doctrine itself will be in danger of being lost, or enfeebled, and deprived of its vital effect on the character and conduct: the dogma becoming a mere formal profession, inefficacious for good, but cumbering the ground, and preventing the growth of any real and heartfelt conviction, from reason or personal experience.

Before quitting the subject of freedom of opinion, it is fit to take notice of those who say, that the free expression of all opinions should be permitted, on condition that the manner be temperate, and do not pass the bounds of fair discussion. Much might be said on the impossibility of fixing where these supposed bounds are to be placed; for if the test be offence to those whose opinion is attacked, I think experience testifies that this offence is given whenever the attack is telling and powerful, and that every opponent who pushes them hard, and whom they find it difficult to answer, appears to them, if he shows any strong feeling on the subject, an intemperate opponent. But this, though an important consideration in a practical point of view, merges in a more fundamental objection. Undoubtedly the manner of asserting an opinion, even though it be a true one, may be very objectionable, and may justly incur severe censure. But the principal offences of the kind are such as it is mostly impossible, unless by accidental self-betrayal, to bring home to conviction. The gravest of them is, to argue sophistically, to suppress facts or arguments, to misstate the elements of the case, or misrepresent the opposite opinion. But all this, even to the most aggravated degree, is so continually done in perfect good faith, by persons who are not considered, and in many other respects may not deserve to be considered, ignorant or incompetent, that it is rarely possible on adequate grounds conscientiously to stamp the misrepresentation as morally culpable; and still less could law presume to interfere with this kind of controversial misconduct. With regard to what is commonly meant by intemperate discussion, namely, invective, sarcasm, personality, and the like, the denunciation of these weapons would deserve more sympathy if it were ever proposed to interdict them equally to both sides; but it is only desired to restrain the employment of them against the prevailing opinion: against the unprevailing they may not only be used without general disapproval, but will be likely to obtain for him who uses them the praise of honest zeal and righteous indignation. Yet whatever mischief arises from their use, is greatest when they are employed against the comparatively defenceless; and whatever unfair advantage can be derived by any opinion from this mode of asserting it, accrues almost exclusively to received opinions. The worst offence of this kind which can be committed by a polemic, is to stigmatize those who hold the contrary opinion as bad and immoral men.

To calumny of this sort, those who hold any unpopular opinion are peculiarly exposed, because they are in general few and uninfluential, and nobody but themselves feels much interest in seeing justice done them; but this weapon is, from the nature of the case, denied to those who attack a prevailing opinion: they can neither use it with safety to themselves, nor if they could, would it do anything but recoil on their own cause. In general, opinions contrary to those commonly received can only obtain a hearing by studied moderation of language, and the most cautious avoidance of unnecessary offence, from which they hardly ever deviate even in a slight degree without losing ground: while unmeasured vituperation employed on the side of the prevailing opinion, really does deter people from professing contrary opinions, and from listening to those who profess them. For the interest, therefore, of truth and justice, it is far more important to restrain this employment of vituperative language than the other; and, for example, if it were necessary to choose, there would be much more need to discourage offensive attacks on infidelity, than on religion. It is, however, obvious that law and authority have no business with restraining either, while opinion ought, in every instance, to determine its verdict by the circumstances of the individual case; condemning every one, on whichever side of the argument he places himself, in whose mode of advocacy either want of candor, or malignity, bigotry or intolerance of feeling manifest themselves, but not inferring these vices from the side which a person takes, though it be the contrary side of the question to our own; and giving merited honor to every one, whatever opinion he may hold, who has calmness to see and honesty to state what his opponents and their opinions really are, exaggerating nothing to their discredit, keeping nothing back which tells, or can be supposed to tell, in their favor. This is the real morality of public discussion; and if often violated, I am happy to think that there are many controversialists who to a great extent observe it, and a still greater number who conscientiously strive towards it.

[1] These words had scarcely been written, when, as if to give them an emphatic contradiction, occurred the Government Press Prosecutions of 1858. That illjudged interference with the liberty of public discussion has not, however, induced me to alter a single word in the text, nor has it at all weakened my conviction that, moments of panic excepted, the era of pains and penalties far political discussion has, in our own country, passed away. For, in the first place, the prosecutions were not persisted in; and in the second, they were never, properly speaking, political prosecutions. The offence charged was not that of criticizing institutions, or the acts or persons of rulers, but of circulating what was deemed an immoral doctrine, the lawfulness of Tyrannicide.

If the arguments of the present chapter are of any validity, there ought to exist the fullest liberty of professing and discussing, as a matter of ethical conviction, any doctrine, however immoral it may be considered. It would, therefore, be irrelevant and out of place to examine here, whether the doctrine of Tyrannicide deserves that title. I shall content myself with saying,

that the subject has been at all times one of the open questions of morals, that the act of a private citizen in striking down a criminal, who, by raising himself above the law, has placed himself beyond the reach of legal punishment or control, has been accounted by whole nations, and by some of the best and wisest of men, not a crime, but an act of exalted virtue and that, right or wrong, it is not of the nature of assassination but of civil war. As such, I hold that the instigation to it, in a specific case, may be a proper subject of punishment, but only if an overt act has followed, and at least a probable connection can be established between the act and the instigation. Even then it is not a foreign government, but the very government assailed, which alone, in the exercise of self-defence, can legitimately punish attacks directed against its own existence.

[2] Thomas Pooley, Bodmin Assizes, July 31, 1857. In December following, he received a free pardon from the Crown.

[3] George Jacob Holyoake, August 17, 1857; Edward Truelove, July, 1857.

[4] Baron de Gleichen, Marlborough Street Police Court, August 4, 1857.

[5] Ample warning may be drawn from the large infusion of the passions of a persecutor, which mingled with the general display of the worst parts of our national character on the occasion of the Sepoy insurrection. The ravings of fanatics or charlatans from the pulpit may be unworthy of notice; but the heads of the Evangelical party have announced as their principle, for the government of Hindoos and Mahomedans, that no schools be supported by public money in which the Bible is not taught, and by necessary consequence that no public employment be given to any but real or pretended Christians. An Under-Secretary of State, in a speech delivered to his constituents on the 12th of November, 1857, is reported to have said: "Toleration of their faith" (the faith of a hundred millions of British subjects), "the superstition which they called religion, by the British Government, had had the effect of retarding the ascendency of the British name, and preventing the salutary growth of Christianity.... Toleration was the great corner-stone of the religious liberties of this country; but do not let them abuse that precious word toleration. As he understood it, it meant the complete liberty to all, freedom of worship, among Christians, who worshipped upon the same foundation. It meant toleration of all sects and denominations of Christians who believed in the one mediation." I desire to call attention to the fact, that a man who has been deemed fit to fill a high office in the government of this country, under a liberal Ministry, maintains the doctrine that all who do not believe in the divinity of Christ are beyond the pale of toleration. Who, after this imbecile display, can indulge the illusion that religious persecution has passed away, never to return?

* * * *

Chapter III: On Individuality, As One Of The Elements Of Wellbeing

SUCH being the reasons which make it imperative that human beings should be free to form opinions, and to express their opinions without reserve; and such the baneful consequences to the intellectual, and through that to the moral nature of man, unless this liberty is either conceded, or asserted in spite of prohibition; let us next examine whether the same reasons do not require that men should be free to act upon their opinions -- to carry these out in their lives, without hindrance, either physical or moral, from their fellow-men, so long as it is at their own risk and peril. This last proviso is of course indispensable. No one pretends that actions should be as free as opinions. On the contrary, even opinions lose their immunity, when the circumstances in which they are expressed are such as to constitute their expression a positive instigation to some mischievous act. An opinion that corndealers are starvers of the poor, or that private property is robbery, ought to be unmolested when simply circulated through the press, but may justly incur punishment when delivered orally to an excited mob assembled before the house of a corn-dealer, or when handed about among the same mob in the form of a placard. Acts of whatever kind, which, without justifiable cause, do harm to others, may be, and in the more important cases absolutely require to be, controlled by the unfavorable sentiments, and, when needful, by the active interference of mankind. The liberty of the individual must be thus far limited; he must not make himself a nuisance to other people. But if he refrains from molesting others in what concerns them, and merely acts according to his own inclination and judgment in things which concern himself, the same reasons which show that opinion should be free, prove also that he should be allowed, without molestation, to carry his opinions into practice at his own cost. That mankind are not infallible; that their truths, for the most part, are only half-truths; that unity of opinion, unless resulting from the fullest and freest comparison of opposite opinions, is not desirable, and diversity not an evil, but a good, until mankind are much more capable than at present of recognizing all sides of the truth, are principles applicable to men's modes of action, not less than to their opinions. As it is useful that while mankind are imperfect there should be different opinions, so is it that there should be different experiments of living; that free scope should be given to varieties of character, short of injury to others; and that the worth of different modes of life should be proved practically, when any one thinks fit to try them. It is desirable, in short, that in things which do not primarily concern others, individuality should assert itself. Where, not the person's own character, but the traditions of customs of other people are the rule of conduct, there is wanting one of the principal ingredients of human happiness, and quite the chief ingredient of individual and social progress.

In maintaining this principle, the greatest difficulty to be encountered does not lie in the appreciation of means towards an acknowledged end, but in the indifference of persons in general to the end itself. If it were felt that

the free development of individuality is one of the leading essentials of well-being; that it is not only a coordinate element with all that is designated by the terms civilization, instruction, education, culture, but is itself a necessary part and condition of all those things; there would be no danger that liberty should be undervalued, and the adjustment of the boundaries between it and social control would present no extraordinary difficulty. But the evil is, that individual spontaneity is hardly recognized by the common modes of thinking as having any intrinsic worth, or deserving any regard on its own account. The majority, being satisfied with the ways of mankind as they now are (for it is they who make them what they are), cannot comprehend why those ways should not be good enough for everybody; and what is more, spontaneity forms no part of the ideal of the majority of moral and social reformers, but is rather looked on with jealousy, as a troublesome and perhaps rebellious obstruction to the general acceptance of what these reformers, in their own judgment, think would be best for mankind. Few persons, out of Germany, even comprehend the meaning of the doctrine which Wilhelm von Humboldt, so eminent both as a savant and as a politician, made the text of a treatise -- that "the end of man, or that which is prescribed by the eternal or immutable dictates of reason, and not suggested by vague and transient desires, is the highest and most harmonious development of his powers to a complete and consistent whole;" that, therefore, the object "towards which every human being must ceaselessly direct his efforts, and on which especially those who design to influence their fellow-men must ever keep their eyes, is the individuality of power and development;" that for this there are two requisites, "freedom, and a variety of situations;" and that from the union of these arise "individual vigor and manifold diversity," which combine themselves in "originality."[1]

Little, however, as people are accustomed to a doctrine like that of Von Humboldt, and surprising as it may be to them to find so high a value attached to individuality, the question, one must nevertheless think, can only be one of degree. No one's idea of excellence in conduct is that people should do absolutely nothing but copy one another. No one would assert that people ought not to put into their mode of life, and into the conduct of their concerns, any impress whatever of their own judgment, or of their own individual character. On the other hand, it would be absurd to pretend that people ought to live as if nothing whatever had been known in the world before they came into it; as if experience had as yet done nothing towards showing that one mode of existence, or of conduct, is preferable to another. Nobody denies that people should be so taught and trained in youth, as to know and benefit by the ascertained results of human experience. But it is the privilege and proper condition of a human being, arrived at the maturity of his faculties, to use and interpret experience in his own way. It is for him to find out what part of recorded experience is properly applicable to his own circumstances and character. The traditions and customs of other people are, to a certain extent, evidence of what their experience has taught them; presumptive evidence, and as such, have a claim to this deference: but, in the first place, their experience

may be too narrow; or they may not have interpreted it rightly. Secondly, their interpretation of experience may be correct but unsuitable to him. Customs are made for customary circumstances, and customary characters: and his circumstances or his character may be uncustomary. Thirdly, though the customs be both good as customs, and suitable to him, yet to conform to custom, merely as custom, does not educate or develop in him any of the qualities which are the distinctive endowment of a human being. The human faculties of perception, judgment, discriminative feeling, mental activity, and even moral preference, are exercised only in making a choice. He who does anything because it is the custom, makes no choice. He gains no practice either in discerning or in desiring what is best. The mental and moral, like the muscular powers, are improved only by being used. The faculties are called into no exercise by doing a thing merely because others do it, no more than by believing a thing only because others believe it. If the grounds of an opinion are not conclusive to the person's own reason, his reason cannot be strengthened, but is likely to be weakened by his adopting it: and if the inducements to an act are not such as are consentaneous to his own feelings and character (where affection, or the rights of others are not concerned), it is so much done towards rendering his feelings and character inert and torpid, instead of active and energetic.

He who lets the world, or his own portion of it, choose his plan of life for him, has no need of any other faculty than the ape-like one of imitation. He who chooses his plan for himself, employs all his faculties. He must use observation to see, reasoning and judgment to foresee, activity to gather materials for decision, discrimination to decide, and when he has decided, firmness and self-control to hold to his deliberate decision. And these qualities he requires and exercises exactly in proportion as the part of his conduct which he determines according to his own judgment and feelings is a large one. It is possible that he might be guided in some good path, and kept out of harm's way, without any of these things. But what will be his comparative worth as a human being? It really is of importance, not only what men do, but also what manner of men they are that do it. Among the works of man, which human life is rightly employed in perfecting and beautifying, the first in importance surely is man himself. Supposing it were possible to get houses built, corn grown, battles fought, causes tried, and even churches erected and prayers said, by machinery -- by automatons in human form -- it would be a considerable loss to exchange for these automatons even the men and women who at present inhabit the more civilized parts of the world, and who assuredly are but starved specimens of what nature can and will produce. Human nature is not a machine to be built after a model, and set to do exactly the work prescribed for it, but a tree, which requires to grow and develop itself on all sides, according to the tendency of the inward forces which make it a living thing.

It will probably be conceded that it is desirable people should exercise their understandings, and that an intelligent following of custom, or even occasionally an

intelligent deviation from custom, is better than a blind and simply mechanical adhesion to it. To a certain extent it is admitted, that our understanding should be our own: but there is not the same willingness to admit that our desires and impulses should be our own likewise; or that to possess impulses of our own, and of any strength, is anything but a peril and a snare. Yet desires and impulses are as much a part of a perfect human being, as beliefs and restraints: and strong impulses are only perilous when not properly balanced; when one set of aims and inclinations is developed into strength, while others, which ought to coexist with them, remain weak and inactive. It is not because men's desires are strong that they act ill; it is because their consciences are weak. There is no natural connection between strong impulses and a weak conscience. The natural connection is the other way. To say that one person's desires and feelings are stronger and more various than those of another, is merely to say that he has more of the raw material of human nature, and is therefore capable, perhaps of more evil, but certainly of more good. Strong impulses are but another name for energy. Energy may be turned to bad uses; but more good may always be made of an energetic nature, than of an indolent and impassive one. Those who have most natural feeling, are always those whose cultivated feelings may be made the strongest. The same strong susceptibilities which make the personal impulses vivid and powerful, are also the source from whence are generated the most passionate love of virtue, and the sternest selfcontrol. It is through the cultivation of these, that society both does its duty and protects its interests: not by rejecting the stuff of which heroes are made, because it knows not how to make them. A person whose desires and impulses are his own -- are the expression of his own nature, as it has been developed and modified by his own culture -- is said to have a character. One whose desires and impulses are not his owN, has no character, no more than a steam-engine has a character. If, in addition to being his own, his impulses are strong, and are under the government of a strong will, he has an energetic character. Whoever thinks that individuality of desires and impulses should not be encouraged to unfold itself, must maintain that society has no need of strong natures -- is not the better for containing many persons who have much character -- and that a high general average of energy is not desirable.

In some early states of society, these forces might be, and were, too much ahead of the power which society then possessed of disciplining and controlling them. There has been a time when the element of spontaneity and individuality was in excess, and the social principle had a hard struggle with it. The difficulty then was, to induce men of strong bodies or minds to pay obedience to any rules which required them to control their impulses. To overcome this difficulty, law and discipline, like the Popes struggling against the Emperors, asserted a power over the whole man, claiming to control all his life in order to control his character -- which society had not found any other sufficient means of binding. But society has now fairly got the better of individuality; and the danger which threatens human nature is not the excess, but the

deficiency, of personal impulses and preferences. Things are vastly changed, since the passions of those who were strong by station or by personal endowment were in a state of habitual rebellion against laws and ordinances, and required to be rigorously chained up to enable the persons within their reach to enjoy any particle of security. In our times, from the highest class of society down to the lowest every one lives as under the eye of a hostile and dreaded censorship. Not only in what concerns others, but in what concerns only themselves, the individual, or the family, do not ask themselves -- what do I prefer? or, what would suit my character and disposition? or, what would allow the best and highest in me to have fair play, and enable it to grow and thrive? They ask themselves, what is suitable to my position? what is usually done by persons of my station and pecuniary circumstances? or (worse still) what is usually done by persons of a station and circumstances superior to mine? I do not mean that they choose what is customary, in preference to what suits their own inclination. It does not occur to them to have any inclination, except for what is customary. Thus the mind itself is bowed to the yoke: even in what people do for pleasure, conformity is the first thing thought of; they like in crowds; they exercise choice only among things commonly done: peculiarity of taste, eccentricity of conduct, are shunned equally with crimes: until by dint of not following their own nature, they have no nature to follow: their human capacities are withered and starved: they become incapable of any strong wishes or native pleasures, and are generally without either opinions or feelings of home growth, or properly their own. Now is this, or is it not, the desirable condition of human nature?

It is so, on the Calvinistic theory. According to that, the one great offence of man is Self-will. All the good of which humanity is capable, is comprised in Obedience. You have no choice; thus you must do, and no otherwise; "whatever is not a duty is a sin." Human nature being radically corrupt, there is no redemption for any one until human nature is killed within him. To one holding this theory of life, crushing out any of the human faculties, capacities, and susceptibilities, is no evil: man needs no capacity, but that of surrendering himself to the will of God: and if he uses any of his faculties for any other purpose but to do that supposed will more effectually, he is better without them. That is the theory of Calvinism; and it is held, in a mitigated form, by many who do not consider themselves Calvinists; the mitigation consisting in giving a less ascetic interpretation to the alleged will of God; asserting it to be his will that mankind should gratify some of their inclinations; of course not in the manner they themselves prefer, but in the way of obedience, that is, in a way prescribed to them by authority; and, therefore, by the necessary conditions of the case, the same for all.

In some such insidious form there is at present a strong tendency to this narrow theory of life, and to the pinched and hidebound type of human character which it patronizes. Many persons, no doubt, sincerely think that human beings thus cramped and dwarfed, are as their Maker designed them to be; just as many have thought that trees are a much finer thing when clipped into pollards, or cut

out into figures of animals, than as nature made them. But if it be any part of religion to believe that man was made by a good Being, it is more consistent with that faith to believe, that this Being gave all human faculties that they might be cultivated and unfolded, not rooted out and consumed, and that he takes delight in every nearer approach made by his creatures to the ideal conception embodied in them, every increase in any of their capabilities of comprehension, of action, or of enjoyment. There is a different type of human excellence from the Calvinistic; a conception of humanity as having its nature bestowed on it for other purposes than merely to be abnegated. "Pagan selfassertion" is one of the elements of human worth, as well as "Christian self-denial."[2] There is a Greek ideal of self-development, which the Platonic and Christian ideal of self-government blends with, but does not supersede. It may be better to be a John Knox than an Alcibiades, but it is better to be a Pericles than either; nor would a Pericles, if we had one in these days, be without anything good which belonged to John Knox.

It is not by wearing down into uniformity all that is individual in themselves, but by cultivating it and calling it forth, within the limits imposed by the rights and interests of others, that human beings become a noble and beautiful object of contemplation; and as the works partake the character of those who do them, by the same process human life also becomes rich, diversified, and animating, furnishing more abundant aliment to high thoughts and elevating feelings, and strengthening the tie which binds every individual to the race, by making the race infinitely better worth belonging to. In proportion to the development of his individuality, each person becomes more valuable to himself, and is therefore capable of being more valuable to others. There is a greater fulness of life about his own existence, and when there is more life in the units there is more in the mass which is composed of them. As much compression as is necessary to prevent the stronger specimens of human nature from encroaching on the rights of others, cannot be dispensed with; but for this there is ample compensation even in the point of view of human development. The means of development which the individual loses by being prevented from gratifying his inclinations to the injury of others, are chiefly obtained at the expense of the development of other people. And even to himself there is a full equivalent in the better development of the social part of his nature, rendered possible by the restraint put upon the selfish part. To be held to rigid rules of justice for the sake of others, develops the feelings and capacities which have the good of others for their object. But to be restrained in things not affecting their good, by their mere displeasure, develops nothing valuable, except such force of character as may unfold itself in resisting the restraint. If acquiesced in, it dulls and blunts the whole nature. To give any fair play to the nature of each, it is essential that different persons should be allowed to lead different lives. In proportion as this latitude has been exercised in any age, has that age been noteworthy to posterity. Even despotism does not produce its worst effects, so long as Individuality exists under it; and whatever crushes individuality is despotism, by whatever name it may be

called, and whether it professes to be enforcing the will of God or the injunctions of men.

Having said that Individuality is the same thing with development, and that it is only the cultivation of individuality which produces, or can produce, well-developed human beings, I might here close the argument: for what more or better can be said of any condition of human affairs, than that it brings human beings themselves nearer to the best thing they can be? or what worse can be said of any obstruction to good, than that it prevents this? Doubtless, however, these considerations will not suffice to convince those who most need convincing; and it is necessary further to show, that these developed human beings are of some use to the undeveloped -- to point out to those who do not desire liberty, and would not avail themselves of it, that they may be in some intelligible manner rewarded for allowing other people to make use of it without hindrance.

In the first place, then, I would suggest that they might possibly learn something from them. It will not be denied by anybody, that originality is a valuable element in human affairs. There is always need of persons not only to discover new truths, and point out when what were once truths are true no longer, but also to commence new practices, and set the example of more enlightened conduct, and better taste and sense in human life. This cannot well be gainsaid by anybody who does not believe that the world has already attained perfection in all its ways and practices. It is true that this benefit is not capable of being rendered by everybody alike: there are but few persons, in comparison with the whole of mankind, whose experiments, if adopted by others, would be likely to be any improvement on established practice. But these few are the salt of the earth; without them, human life would become a stagnant pool. Not only is it they who introduce good things which did not before exist; it is they who keep the life in those which already existed. If there were nothing new to be done, would human intellect cease to be necessary? Would it be a reason why those who do the old things should forget why they are done, and do them like cattle, not like human beings? There is only too great a tendency in the best beliefs and practices to degenerate into the mechanical; and unless there were a succession of persons whose ever-recurring originality prevents the grounds of those beliefs and practices from becoming merely traditional, such dead matter would not resist the smallest shock from anything really alive, and there would be no reason why civilization should not die out, as in the Byzantine Empire. Persons of genius, it is true, are, and are always likely to be, a small minority; but in order to have them, it is necessary to preserve the soil in which they grow. Genius can only breathe freely in an atmosphere of freedom. Persons of genius are, ex vi termini, more individual than any other people -- less capable, consequently, of fitting themselves, without hurtful compression, into any of the small number of moulds which society provides in order to save its members the trouble of forming their own character. If from timidity they consent to be forced into one of these moulds, and to let all that part of themselves which cannot expand under the pressure remain unexpanded, society will be little the

better for their genius. If they are of a strong character, and break their fetters they become a mark for the society which has not succeeded in reducing them to common-place, to point at with solemn warning as "wild," "erratic," and the like; much as if one should complain of the Niagara river for not flowing smoothly between its banks like a Dutch canal.

I insist thus emphatically on the importance of genius, and the necessity of allowing it to unfold itself freely both in thought and in practice, being well aware that no one will deny the position in theory, but knowing also that almost every one, in reality, is totally indifferent to it. People think genius a fine thing if it enables a man to write an exciting poem, or paint a picture. But in its true sense, that of originality in thought and action, though no one says that it is not a thing to be admired, nearly all, at heart, think they can do very well without it. Unhappily this is too natural to be wondered at. Originality is the one thing which unoriginal minds cannot feel the use of. They cannot see what it is to do for them: how should they? If they could see what it would do for them, it would not be originality. The first service which originality has to render them, is that of opening their eyes: which being once fully done, they would have a chance of being themselves original. Meanwhile, recollecting that nothing was ever yet done which some one was not the first to do, and that all good things which exist are the fruits of originality, let them be modest enough to believe that there is something still left for it to accomplish, and assure themselves that they are more in need of originality, the less they are conscious of the want.

In sober truth, whatever homage may be professed, or even paid, to real or supposed mental superiority, the general tendency of things throughout the world is to render mediocrity the ascendant power among mankind. In ancient history, in the Middle Ages, and in a diminishing degree through the long transition from feudality to the present time, the individual was a power in himself; and If he had either great talents or a high social position, he was a considerable power. At present individuals are lost in the crowd. In politics it is almost a triviality to say that public opinion now rules the world. The only power deserving the name is that of masses, and of governments while they make themselves the organ of the tendencies and instincts of masses. This is as true in the moral and social relations of private life as in public transactions. Those whose opinions go by the name of public opinion, are not always the same sort of public: in America, they are the whole white population; in England, chiefly the middle class. But they are always a mass, that is to say, collective mediocrity. And what is still greater novelty, the mass do not now take their opinions from dignitaries in Church or State, from ostensible leaders, or from books. Their thinking is done for them by men much like themselves, addressing them or speaking in their name, on the spur of the moment, through the newspapers. I am not complaining of all this. I do not assert that anything better is compatible, as a general rule, with the present low state of the human mind. But that does not hinder the government of mediocrity from being

mediocre government. No government by a democracy or a numerous aristocracy, either in its political acts or in the opinions, qualities, and tone of mind which it fosters, ever did or could rise above mediocrity, except in so far as the sovereign Many have let themselves be guided (which in their best times they always have done) by the counsels and influence of a more highly gifted and instructed One or Few. The initiation of all wise or noble things, comes and must come from individuals; generally at first from some one individual. The honor and glory of the average man is that he is capable of following that initiative; that he can respond internally to wise and noble things, and be led to them with his eyes open. I am not countenancing the sort of "hero-worship" which applauds the strong man of genius for forcibly seizing on the government of the world and making it do his bidding in spite of itself. All he can claim is, freedom to point out the way. The power of compelling others into it, is not only inconsistent with the freedom and development of all the rest, but corrupting to the strong man himself. It does seem, however, that when the opinions of masses of merely average men are everywhere become or becoming the dominant power, the counterpoise and corrective to that tendency would be, the more and more pronounced individuality of those who stand on the higher eminences of thought. It Is in these circumstances most especially, that exceptional individuals, instead of being deterred, should be encouraged in acting differently from the mass. In other times there was no advantage in their doing so, unless they acted not only differently, but better. In this age the mere example of non-conformity, the mere refusal to bend the knee to custom, is itself a service. Precisely because the tyranny of opinion is such as to make eccentricity a reproach, it is desirable, in order to break through that tyranny, that people should be eccentric. Eccentricity has always abounded when and where strength of character has abounded; and the amount of eccentricity in a society has generally been proportional to the amount of genius, mental vigor, and moral courage which it contained. That so few now dare to be eccentric, marks the chief danger of the time.

I have said that it is important to give the freest scope possible to uncustomary things, in order that it may in time appear which of these are fit to be converted into customs. But independence of action, and disregard of custom are not solely deserving of encouragement for the chance they afford that better modes of action, and customs more worthy of general adoption, may be struck out; nor is it only persons of decided mental superiority who have a just claim to carry on their lives in their own way. There is no reason that all human existences should be constructed on some one, or some small number of patterns. If a person possesses any tolerable amount of common sense and experience, his own mode of laying out his existence is the best, not because it is the best in itself, but because it is his own mode. Human beings are not like sheep; and even sheep are not undistinguishably alike. A man cannot get a coat or a pair of boots to fit him, unless they are either made to his measure, or he has a whole warehouseful to choose from: and is it easier to fit him with a life than with a coat, or are human beings more like one another in their whole physical and spiritual conformation than in the

shape of their feet? If it were only that people have diversities of taste that is reason enough for not attempting to shape them all after one model. But different persons also require different conditions for their spiritual development; and can no more exist healthily in the same moral, than all the variety of plants can in the same physical atmosphere and climate. The same things which are helps to one person towards the cultivation of his higher nature, are hindrances to another. The same mode of life is a healthy excitement to one, keeping all his faculties of action and enjoyment in their best order, while to another it is a distracting burden, which suspends or crushes all internal life. Such are the differences among human beings in their sources of pleasure, their susceptibilities of pain, and the operation on them of different physical and moral agencies, that unless there is a corresponding diversity in their modes of life, they neither obtain their fair share of happiness, nor grow up to the mental, moral, and aesthetic stature of which their nature is capable. Why then should tolerance, as far as the public sentiment is concerned, extend only to tastes and modes of life which extort acquiescence by the multitude of their adherents? Nowhere (except in some monastic institutions) is diversity of taste entirely unrecognized; a person may without blame, either like or dislike rowing, or smoking, or music, or athletic exercises, or chess, or cards, or study, because both those who like each of these things, and those who dislike them, are too numerous to be put down. But the man, and still more the woman, who can be accused either of doing "what nobody does," or of not doing "what everybody does," is the subject of as much depreciatory remark as if he or she had committed some grave moral delinquency. Persons require to possess a title, or some other badge of rank, or the consideration of people of rank, to be able to indulge somewhat in the luxury of doing as they like without detriment to their estimation. To indulge somewhat, I repeat: for whoever allow themselves much of that in dulgence, incur the risk of something worse than disparaging speeches -- they are in peril of a commission de lunatico, and of having their property taken from them and given to their relations.[3]

There is one characteristic of the present direction of public opinion, peculiarly calculated to make it intolerant of any marked demonstration of individuality. The general average of mankind are not only moderate in intellect, but also moderate in inclinations: they have no tastes or wishes strong enough to incline them to do anything unusual, and they consequently do not understand those who have, and class all such with the wild and intemperate whom they are accustomed to look down upon. Now, in addition to this fact which is general, we have only to suppose that a strong movement has set in towards the improvement of morals, and it is evident what we have to expect. In these days such a movement has set in; much has actually been effected in the way of increased regularity of conduct, and discouragement of excesses; and there is a philanthropic spirit abroad, for the exercise of which there is no more inviting field than the moral and prudential improvement of our fellow-creatures. These tendencies of the times cause the public to be more disposed than at most former periods to prescribe

general rules of conduct, and endeavor to make every one conform to the approved standard. And that standard, express or tacit, is to desire nothing strongly. Its ideal of character is to be without any marked character; to maim by compression, like a Chinese lady's foot, every part of human nature which stands out prominently, and tends to make the person markedly dissimilar in outline to commonplace humanity.

As is usually the case with ideals which exclude one half of what is desirable, the present standard of approbation produces only an inferior imitation of the other half. Instead of great energies guided by vigorous reason, and strong feelings strongly controlled by a conscientious will, its result is weak feelings and weak energies, which therefore can be kept in outward conformity to rule without any strength either of will or of reason. Already energetic characters on any large scale are becoming merely traditional. There is now scarcely any outlet for energy in this country except business. The energy expended in that may still be regarded as considerable. What little is left from that employment, is expended on some hobby; which may be a useful, even a philanthropic hobby, but is always some one thing, and generally a thing of small dimensions. The greatness of England is now all collective: individually small, we only appear capable of anything great by our habit of combining; and with this our moral and religious philanthropists are perfectly contented. But it was men of another stamp than this that made England what it has been; and men of another stamp will be needed to prevent its decline.

The despotism of custom is everywhere the standing hindrance to human advancement, being in unceasing antagonism to that disposition to aim at something better than customary, which is called, according to circumstances, the spirit of liberty, or that of progress or improvement. The spirit of improvement is not always a spirit of liberty, for it may aim at forcing improvements on an unwilling people; and the spirit of liberty, in so far as it resists such attempts, may ally itself locally and temporarily with the opponents of improvement; but the only unfailing and permanent source of improvement is liberty, since by it there are as many possible independent centres of improvement as there are individuals. The progressive principle, however, in either shape, whether as the love of liberty or of improvement, is antagonistic to the sway of Custom, involving at least emancipation from that yoke; and the contest between the two constitutes the chief interest of the history of mankind. The greater part of the world has, properly speaking, no history, because the despotism of Custom is complete. This is the case over the whole East. Custom is there, in all things, the final appeal; Justice and right mean conformity to custom; the argument of custom no one, unless some tyrant intoxicated with power, thinks of resisting. And we see the result. Those nations must once have had originality; they did not start out of the ground populous, lettered, and versed in many of the arts of life; they made themselves all this, and were then the greatest and most powerful nations in the world. What are they now? The subjects or dependents of tribes whose forefathers

wandered in the forests when theirs had magnificent palaces and gorgeous temples, but over whom custom exercised only a divided rule with liberty and progress. A people, it appears, may be progressive for a certain length of time, and then stop: when does it stop? When it ceases to possess individuality. If a similar change should befall the nations of Europe, it will not be in exactly the same shape: the despotism of custom with which these nations are threatened is not precisely stationariness. It proscribes singularity, but it does not preclude change, provided all change together. We have discarded the fixed costumes of our forefathers; every one must still dress like other people, but the fashion may change once or twice a year. We thus take care that when there is change, it shall be for change's sake, and not from any idea of beauty or convenience; for the same idea of beauty or convenience would not strike all the world at the same moment, and be simultaneously thrown aside by all at another moment. But we are progressive as well as changeable: we continually make new inventions in mechanical things, and keep them until they are again superseded by better; we are eager for improvement in politics, in education, even in morals, though in this last our idea of improvement chiefly consists in persuading or forcing other people to be as good as ourselves. It is not progress that we object to; on the contrary, we flatter ourselves that we are the most progressive people who ever lived. It is individuality that we war against: we should think we had done wonders if we had made ourselves all alike; forgetting that the unlikeness of one person to another is generally the first thing which draws the attention of either to the imperfection of his own type, and the superiority of another, or the possibility, by combining the advantages of both, of producing something better than either. We have a warning example in China -- a nation of much talent, and, in some respects, even wisdom, owing to the rare good fortune of having been provided at an early period with a particularly good set of customs, the work, in some measure, of men to whom even the most enlightened European must accord, under certain limitations, the title of sages and philosophers. They are remarkable, too, in the excellence of their apparatus for impressing, as far as possible, the best wisdom they possess upon every mind in the community, and securing that those who have appropriated most of it shall occupy the posts of honor and power. Surely the people who did this have discovered the secret of human progressiveness, and must have kept themselves steadily at the head of the movement of the world. On the contrary, they have become stationary -- have remained so for thousands of years; and if they are ever to be farther improved, it must be by foreigners. They have succeeded beyond all hope in what English philanthropists are so industriously working at -- in making a people all alike, all governing their thoughts and conduct by the same maxims and rules; and these are the fruits. The modern regime of public opinion is, in an unorganized form, what the Chinese educational and political systems are in an organized; and unless individuality shall be able successfully to assert itself against this yoke, Europe, notwithstanding its noble antecedents and its professed Christianity, will tend to become another China.

What is it that has hitherto preserved Europe from this lot? What has made the European family of nations an improving, instead of a stationary portion of mankind? Not any superior excellence in them, which when it exists, exists as the effect, not as the cause; but their remarkable diversity of character and culture. Individuals, classes, nations, have been extremely unlike one another: they have struck out a great variety of paths, each leading to something valuable; and although at every period those who travelled in different paths have been intolerant of one another, and each would have thought it an excellent thing if all the rest could have been compelled to travel his road, their attempts to thwart each other's development have rarely had any permanent success, and each has in time endured to receive the good which the others have offered. Europe is, in my judgment, wholly indebted to this plurality of paths for its progressive and many-sided development. But it already begins to possess this benefit in a considerably less degree. It is decidedly advancing towards the Chinese ideal of making all people alike. M. de Tocqueville, in his last important work, remarks how much more the Frenchmen of the present day resemble one another, than did those even of the last generation. The same remark might be made of Englishmen in a far greater degree. In a passage already quoted from Wilhelm von Humboldt, he points out two things as necessary conditions of human development, because necessary to render people unlike one another; namely, freedom, and variety of situations. The second of these two conditions is in this country every day diminishing. The circumstances which surround different classes and individuals, and shape their characters, are daily becoming more assimilated. Formerly, different ranks, different neighborhoods, different trades and professions lived in what might be called different worlds; at present, to a great degree, in the same. Comparatively speaking, they now read the same things, listen to the same things, see the same things, go to the same places, have their hopes and fears directed to the same objects, have the same rights and liberties, and the same means of asserting them. Great as are the differences of position which remain, they are nothing to those which have ceased. And the assimilation is still proceeding. All the political changes of the age promote it, since they all tend to raise the low and to lower the high. Every extension of education promotes it, because education brings people under common influences, and gives them access to the general stock of facts and sentiments. Improvements in the means of communication promote it, by bringing the inhabitants of distant places into personal contact, and keeping up a rapid flow of changes of residence between one place and another. The increase of commerce and manufactures promotes it, by diffusing more widely the advantages of easy circumstances, and opening all objects of ambition, even the highest, to general competition, whereby the desire of rising becomes no longer the character of a particular class, but of all classes. A more powerful agency than even all these, in bringing about a general similarity among mankind, is the complete establishment, in this and other free countries, of the ascendancy of public opinion in the State. As the various social eminences which enabled persons entrenched on them to disregard the opinion of the multitude, gradually

became levelled; as the very idea of resisting the will of the public, when it is positively known that they have a will, disappears more and more from the minds of practical politicians; there ceases to be any social support for non-conformity -- any substantive power in society, which, itself opposed to the ascendancy of numbers, is interested in taking under its protection opinions and tendencies at variance with those of the public.

The combination of all these causes forms so great a mass of influences hostile to Individuality, that it is not easy to see how it can stand its ground. It will do so with increasing difficulty, unless the intelligent part of the public can be made to feel its value -- to see that it is good there should be differences, even though not for the better, even though, as it may appear to them, some should be for the worse. If the claims of Individuality are ever to be asserted, the time is now, while much is still wanting to complete the enforced assimilation. It is only in the earlier stages that any stand can be successfully made against the encroachment. The demand that all other people shall resemble ourselves, grows by what it feeds on. If resistance waits till life is reduced nearly to one uniform type, all deviations from that type will come to be considered impious, immoral, even monstrous and contrary to nature. Mankind speedily become unable to conceive diversity, when they have been for some time unaccustomed to see it.

[2] Sterling's Essays.

[3] There is something both contemptible and frightful in the sort of evidence on which, of late years, any person can be judicially declared unfit for the management of his affairs; and after his death, his disposal of his property can be set aside, if there is enough of it to pay the expenses of litigation -- which are charged on the property itself. All of the minute details of his daily life are pried into, and whatever is found which, seen through the medium of the perceiving and escribing faculties of the lowest of the low, bears an appearance unlike absolute commonplace, is laid before the jury as evidence of insanity, and often with success; the jurors being little, if at all, less vulgar and ignorant than the witnesses; while the judges, with that extraordinary want of knowledge of human nature and life which continually astonishes us in English lawyers, often help to mislead them. These trials speak volumes as to the state of feeling and opinion among the vulgar with regard to human liberty. So far from setting any value on individuality -- so far from respecting the rights of each individual to act, in things indifferent, as seems good to his own judgment and inclinations, judges and juries cannot even conceive that a person in a state of sanity can desire such freedom. In former days, when it was proposed to burn atheists, charitable people used to suggest putting them in a madhouse instead: it would be nothing surprising now-a-days were we to see this done, and the doers applauding themselves, because, instead of persecuting

for religion, they had adopted so humane and Christian a mode of treating these unfortunates, not without a silent satisfaction at their having thereby obtained their deserts.

Chapter IV: Of The Limits To The Authority Of Society Over The Individual

WHAT, then, is the rightful limit to the sovereignty of the individual over himself? Where does the authority of society begin? How much of human life should be assigned to individuality, and how much to society?

Each will receive its proper share, if each has that which more particularly concerns it. To individuality should belong the part of life in which it is chiefly the individual that is interested; to society, the part which chiefly interests society.

Though society is not founded on a contract, and though no good purpose is answered by inventing a contract in order to deduce social obligations from it, every one who receives the protection of society owes a return for the benefit, and the fact of living in society renders it indispensable that each should be bound to observe a certain line of conduct towards the rest. This conduct consists, first, in not injuring the interests of one another; or rather certain interests, which, either by express legal provision or by tacit understanding, ought to be considered as rights; and secondly, in each person's bearing his share (to be fixed on some equitable principle) of the labors and sacrifices incurred for defending the society or its members from injury and molestation. These conditions society is justified in enforcing, at all costs to those who endeavor to withhold fulfilment. Nor is this all that society may do. The acts of an individual may be hurtful to others, or wanting in due consideration for their welfare, without going the length of violating any of their constituted rights. The offender may then be justly punished by opinion, though not by law. As soon as any part of a person's conduct affects prejudicially the interests of others, society has jurisdiction over it, and the question whether the general welfare will or will not be promoted by interfering with it, becomes open to discussion. But there is no room for entertaining any such question when a person's conduct affects the interests of no persons besides himself, or needs not affect them unless they like (all the persons concerned being of full age, and the ordinary amount of understanding). In all such cases there should be perfect freedom, legal and social, to do the action and stand the consequences.

It would be a great misunderstanding of this doctrine, to suppose that it is one of selfish indifference, which pretends that human beings have no business with each other's conduct in life, and that they should not concern themselves about the well-doing or well-being of one another, unless their own interest is involved. Instead of any diminution, there is need of a great increase of disinterested exertion to promote the good of others. But

disinterested benevolence can find other instruments to persuade people to their good, than whips and scourges, either of the literal or the metaphorical sort. I am the last person to undervalue the self-regarding virtues; they are only second in importance, if even second, to the social. It is equally the business of education to cultivate both. But even education works by conviction and persuasion as well as by compulsion, and it is by the former only that, when the period of education is past, the self-regarding virtues should be inculcated. Human beings owe to each other help to distinguish the better from the worse, and encouragement to choose the former and avoid the latter. They should be forever stimulating each other to increased exercise of their higher faculties, and increased direction of their feelings and aims towards wise instead of foolish, elevating instead of degrading, objects and contemplations. But neither one person, nor any number of persons, is warranted in saying to another human creature of ripe years, that he shall not do with his life for his own benefit what he chooses to do with it. He is the person most interested in his own well-being, the interest which any other person, except in cases of strong personal attachment, can have in it, is trifling, compared with that which he himself has; the interest which society has in him individually (except as to his conduct to others) is fractional, and altogether indirect: while, with respect to his own feelings and circumstances, the most ordinary man or woman has means of knowledge immeasurably surpassing those that can be possessed by any one else. The interference of society to overrule his judgment and purposes in what only regards himself, must be grounded on general presumptions; which may be altogether wrong, and even if right, are as likely as not to be misapplied to individual cases, by persons no better acquainted with the circumstances of such cases than those are who look at them merely from without. In this department, therefore, of human affairs, Individuality has its proper field of action. In the conduct of human beings towards one another, it is necessary that general rules should for the most part be observed, in order that people may know what they have to expect; but in each person's own concerns, his individual spontaneity is entitled to free exercise. Considerations to aid his judgment, exhortations to strengthen his will, may be offered to him, even obtruded on him, by others; but he, himself, is the final judge. All errors which he is likely to commit against advice and warning, are far outweighed by the evil of allowing others to constrain him to what they deem his good.

I do not mean that the feelings with which a person is regarded by others, ought not to be in any way affected by his self-regarding qualities or deficiencies. This is neither possible nor desirable. If he is eminent in any of the qualities which conduce to his own good, he is, so far, a proper object of admiration. He is so much the nearer to the ideal perfection of human nature. If he is grossly deficient in those qualities, a sentiment the opposite of admiration will follow. There is a degree of folly, and a degree of what may be called (though the phrase is not unobjectionable) lowness or depravation of taste, which, though it cannot justify doing harm to the person who manifests it, renders him necessarily and properly a subject

of distaste, or, in extreme cases, even of contempt: a person could not have the opposite qualities in due strength without entertaining these feelings. Though doing no wrong to any one, a person may so act as to compel us to judge him, and feel to him, as a fool, or as a being of an inferior order: and since this judgment and feeling are a fact which he would prefer to avoid, it is doing him a service to warn him of it beforehand, as of any other disagreeable consequence to which he exposes himself. It would be well, indeed, if this good office were much more freely rendered than the common notions of politeness at present permit, and if one person could honestly point out to another that he thinks him in fault, without being considered unmannerly or presuming. We have a right, also, in various ways, to act upon our unfavorable opinion of any one, not to the oppression of his individuality, but in the exercise of ours. We are not bound, for example, to seek his society; we have a right to avoid it (though not to parade the avoidance), for we have a right to choose the society most acceptable to us. We have a right, and it may be our duty, to caution others against him, if we think his example or conversation likely to have a pernicious effect on those with whom he associates. We may give others a preference over him in optional good offices, except those which tend to his improvement. In these various modes a person may suffer very severe penalties at the hands of others, for faults which directly concern only himself; but he suffers these penalties only in so far as they are the natural, and, as it were, the spontaneous consequences of the faults themselves, not because they are purposely inflicted on him for the sake of punishment. A person who shows rashness, obstinacy, self-conceit -- who cannot live within moderate means -- who cannot restrain himself from hurtful indulgences -- who pursues animal pleasures at the expense of those of feeling and intellect -- must expect to be lowered in the opinion of others, and to have a less share of their favorable sentiments, but of this he has no right to complain, unless he has merited their favor by special excellence in his social relations, and has thus established a title to their good offices, which is not affected by his demerits towards himself.

What I contend for is, that the inconveniences which are strictly inseparable from the unfavorable judgment of others, are the only ones to which a person should ever be subjected for that portion of his conduct and character which concerns his own good, but which does not affect the interests of others in their relations with him. Acts injurious to others require a totally different treatment. Encroachment on their rights; infliction on them of any loss or damage not justified by his own rights; falsehood or duplicity in dealing with them; unfair or ungenerous use of advantages over them; even selfish abstinence from defending them against injury -- these are fit objects of moral reprobation, and, in grave cases, of moral retribution and punishment. And not only these acts, but the dispositions which lead to them, are properly immoral, and fit subjects of disapprobation which may rise to abhorrence. Cruelty of disposition; malice and ill-nature; that most anti-social and odious of all passions, envy; dissimulation and insincerity, irascibility on insufficient cause, and

resentment disproportioned to the provocation; the love of domineering over others; the desire to engross more than one's share of advantages (the [greekword] of the Greeks); the pride which derives gratification from the abasement of others; the egotism which thinks self and its concerns more important than everything else, and decides all doubtful questions in his own favor; -- these are moral vices, and constitute a bad and odious moral character: unlike the self-regarding faults previously mentioned, which are not properly immoralities, and to whatever pitch they may be carried, do not constitute wickedness. They may be proofs of any amount of folly, or want of personal dignity and self-respect; but they are only a subject of moral reprobation when they involve a breach of duty to others, for whose sake the individual is bound to have care for himself. What are called duties to ourselves are not socially obligatory, unless circumstances render them at the same time duties to others. The term duty to oneself, when it means anything more than prudence, means self-respect or self-development; and for none of these is any one accountable to his fellow-creatures, because for none of them is it for the good of mankind that he be held accountable to them.

The distinction between the loss of consideration which a person may rightly incur by defect of prudence or of personal dignity, and the reprobation which is due to him for an offence against the rights of others, is not a merely nominal distinction. It makes a vast difference both in our feelings and in our conduct towards him, whether he displeases us in things in which we think we have a right to control him, or in things in which we know that we have not. If he displeases us, we may express our distaste, and we may stand aloof from a person as well as from a thing that displeases us; but we shall not therefore feel called on to make his life uncomfortable. We shall reflect that he already bears, or will bear, the whole penalty of his error; if he spoils his life by mismanagement, we shall not, for that reason, desire to spoil it still further: instead of wishing to punish him, we shall rather endeavor to alleviate his punishment, by showing him how he may avoid or cure the evils his conduct tends to bring upon him. He may be to us an object of pity, perhaps of dislike, but not of anger or resentment; we shall not treat him like an enemy of society: the worst we shall think ourselves justified in doing is leaving him to himself, If we do not interfere benevolently by showing interest or concern for him. It is far otherwise if he has infringed the rules necessary for the protection of his fellow-creatures, individually or collectively. The evil consequences of his acts do not then fall on himself, but on others; and society, as the protector of all its members, must retaliate on him; must inflict pain on him for the express purpose of punishment, and must take care that it be sufficiently severe. In the one case, he is an offender at our bar, and we are called on not only to sit in judgment on him, but, in one shape or another, to execute our own sentence: in the other case, it is not our part to inflict any suffering on him, except what may incidentally follow from our using the same liberty in the regulation of our own affairs, which we allow to him in his.

The distinction here pointed out between the part of a

person's life which concerns only himself, and that which concerns others, many persons will refuse to admit. How (it may be asked) can any part of the conduct of a member of society be a matter of indifference to the other members? No person is an entirely isolated being; it is impossible for a person to do anything seriously or permanently hurtful to himself, without mischief reaching at least to his near connections, and often far beyond them. If he injures his property, he does harm to those who directly or indirectly derived support from it, and usually diminishes, by a greater or less amount, the general resources of the community. If he deteriorates his bodily or mental faculties, he not only brings evil upon all who depended on him for any portion of their happiness, but disqualifies himself for rendering the services which he owes to his fellow-creatures generally; perhaps becomes a burden on their affection or benevolence; and if such conduct were very frequent, hardly any offence that is committed would detract more from the general sum of good. Finally, if by his vices or follies a person does no direct harm to others, he is nevertheless (it may be said) injurious by his example; and ought to be compelled to control himself, for the sake of those whom the sight or knowledge of his conduct might corrupt or mislead.

And even (it will be added) if the consequences of misconduct could be confined to the vicious or thoughtless individual, ought society to abandon to their own guidance those who are manifestly unfit for it? If protection against themselves is confessedly due to children and persons under age, is not society equally bound to afford it to persons of mature years who are equally incapable of self-government? If gambling, or drunkenness, or incontinence, or idleness, or uncleanliness, are as injurious to happiness, and as great a hindrance to improvement, as many or most of the acts prohibited by law, why (it may be asked) should not law, so far as is consistent with practicability and social convenience, endeavor to repress these also? And as a supplement to the unavoidable imperfections of law, ought not opinion at least to organize a powerful police against these vices, and visit rigidly with social penalties those who are known to practise them? There is no question here (it may be said) about restricting individuality, or impeding the trial of new and original experiments in living. The only things it is sought to prevent are things which have been tried and condemned from the beginning of the world until now; things which experience has shown not to be useful or suitable to any person's individuality. There must be some length of time and amount of experience, after which a moral or prudential truth may be regarded as established, and it is merely desired to prevent generation after generation from falling over the same precipice which has been fatal to their predecessors.

I fully admit that the mischief which a person does to himself, may seriously affect, both through their sympathies and their interests, those nearly connected with him, and in a minor degree, society at large. When, by conduct of this sort, a person is led to violate a distinct and assignable obligation to any other person or persons, the case is taken out of the self-regarding class, and becomes amenable to

moral disapprobation in the proper sense of the term. If, for example, a man, through intemperance or extravagance, becomes unable to pay his debts, or, having undertaken the moral responsibility of a family, becomes from the same cause incapable of supporting or educating them, he is deservedly reprobated, and might be justly punished; but it is for the breach of duty to his family or creditors, not for the extravagence. If the resources which ought to have been devoted to them, had been diverted from them for the most prudent investment, the moral culpability would have been the same. George Barnwell murdered his uncle to get money for his mistress, but if he had done it to set himself up in business, he would equally have been hanged. Again, in the frequent case of a man who causes grief to his family by addiction to bad habits, he deserves reproach for his unkindness or ingratitude; but so he may for cultivating habits not in themselves vicious, if they are painful to those with whom he passes his life, or who from personal ties are dependent on him for their comfort. Whoever fails in the consideration generally due to the interests and feelings of others, not being compelled by some more imperative duty, or justified by allowable self-preference, is a subject of moral disapprobation for that failure, but not for the cause of it, nor for the errors, merely personal to himself, which may have remotely led to it. In like manner, when a person disables himself, by conduct purely self-regarding, from the performance of some definite duty incumbent on him to the public, he is guilty of a social offence. No person ought to be punished simply for being drunk; but a soldier or a policeman should be punished for being drunk on duty. Whenever, in short, there is a definite damage, or a definite risk of damage, either to an individual or to the public, the case is taken out of the province of liberty, and placed in that of morality or law.

But with regard to the merely contingent or, as it may be called, constructive injury which a person causes to society, by conduct which neither violates any specific duty to the public, nor occasions perceptible hurt to any assignable individual except himself; the inconvenience is one which society can afford to bear, for the sake of the greater good of human freedom. If grown persons are to be punished for not taking proper care of themselves, I would rather it were for their own sake, than under pretence of preventing them from impairing their capacity of rendering to society benefits which society does not pretend it has a right to exact. But I cannot consent to argue the point as if society had no means of bringing its weaker members up to its ordinary standard of rational conduct, except waiting till they do something irrational, and then punishing them, legally or morally, for it. Society has had absolute power over them during all the early portion of their existence: it has had the whole period of childhood and nonage in which to try whether it could make them capable of rational conduct in life. The existing generation is master both of the training and the entire circumstances of the generation to come; it cannot indeed make them perfectly wise and good, because it is itself so lamentably deficient in goodness and wisdom; and its best efforts are not always, in individual cases, its most successful ones; but it is perfectly well able to make the rising generation, as a whole, as good as,

and a little better than, itself. If society lets any considerable number of its members grow up mere children, incapable of being acted on by rational consideration of distant motives, society has itself to blame for the consequences. Armed not only with all the powers of education, but with the ascendency which the authority of a received opinion always exercises over the minds who are least fitted to judge for themselves; and aided by the natural penalties which cannot be prevented from falling on those who incur the distaste or the contempt of those who know them; let not society pretend that it needs, besides all this, the power to issue commands and enforce obedience in the personal concerns of individuals, in which, on all principles of justice and policy, the decision ought to rest with those who are to abide the consequences. Nor is there anything which tends more to discredit and frustrate the better means of influencing conduct, than a resort to the worse. If there be among those whom it is attempted to coerce into prudence or temperance, any of the material of which vigorous and independent characters are made, they will infallibly rebel against the yoke. No such person will ever feel that others have a right to control him in his concerns, such as they have to prevent him from injuring them in theirs; and it easily comes to be considered a mark of spirit and courage to fly in the face of such usurped authority, and do with ostentation the exact opposite of what it enjoins; as in the fashion of grossness which succeeded, in the time of Charles II., to the fanatical moral intolerance of the Puritans. With respect to what is said of the necessity of protecting society from the bad example set to others by the vicious or the self-indulgent; it is true that bad example may have a pernicious effect, especially the example of doing wrong to others with impunity to the wrong-doer. But we are now speaking of conduct which, while it does no wrong to others, is supposed to do great harm to the agent himself: and I do not see how those who believe this, can think otherwise than that the example, on the whole, must be more salutary than hurtful, since, if it displays the misconduct, it displays also the painful or degrading consequences which, if the conduct is justly censured, must be supposed to be in all or most cases attendant on it.

But the strongest of all the arguments against the interference of the public with purely personal conduct, is that when it does interfere, the odds are that it interferes wrongly, and in the wrong place. On questions of social morality, of duty to others, the opinion of the public, that is, of an overruling majority, though often wrong, is likely to be still oftener right; because on such questions they are only required to judge of their own interests; of the manner in which some mode of conduct, if allowed to be practised, would affect themselves. But the opinion of a similar majority, imposed as a law on the minority, on questions of self-regarding conduct, is quite as likely to be wrong as right; for in these cases public opinion means, at the best, some people's opinion of what is good or bad for other people; while very often it does not even mean that; the public, with the most perfect indifference, passing over the pleasure or convenience of those whose conduct they censure, and considering only their own

preference. There are many who consider as an injury to themselves any conduct which they have a distaste for, and resent it as an outrage to their feelings; as a religious bigot, when charged with disregarding the religious feelings of others, has been known to retort that they disregard his feelings, by persisting in their abominable worship or creed. But there is no parity between the feeling of a person for his own opinion, and the feeling of another who is offended at his holding it; no more than between the desire of a thief to take a purse, and the desire of the right owner to keep it. And a person's taste is as much his own peculiar concern as his opinion or his purse. It is easy for any one to imagine an ideal public, which leaves the freedom and choice of individuals in all uncertain matters undisturbed, and only requires them to abstain from modes of conduct which universal experience has condemned. But where has there been seen a public which set any such limit to its censorship? or when does the public trouble itself about universal experience. In its interferences with personal conduct it is seldom thinking of anything but the enormity of acting or feeling differently from itself; and this standard of judgment, thinly disguised, is held up to mankind as the dictate of religion and philosophy, by nine tenths of all moralists and speculative writers. These teach that things are right because they are right; because we feel them to be so. They tell us to search in our own minds and hearts for laws of conduct binding on ourselves and on all others. What can the poor public do but apply these instructions, and make their own personal feelings of good and evil, if they are tolerably unanimous in them, obligatory on all the world?

The evil here pointed out is not one which exists only in theory; and it may perhaps be expected that I should specify the instances in which the public of this age and country improperly invests its own preferences with the character of moral laws. I am not writing an essay on the aberrations of existing moral feeling. That is too weighty a subject to be discussed parenthetically, and by way of illustration. Yet examples are necessary, to show that the principle I maintain is of serious and practical moment, and that I am not endeavoring to erect a barrier against imaginary evils. And it is not difficult to show, by abundant instances, that to extend the bounds of what may be called moral police, until it encroaches on the most unquestionably legitimate liberty of the individual, is one of the most universal of all human propensities.

As a first instance, consider the antipathies which men cherish on no better grounds than that persons whose religious opinions are different from theirs, do not practise their religious observances, especially their religious abstinences. To cite a rather trivial example, nothing in the creed or practice of Christians does more to envenom the hatred of Mahomedans against them, than the fact of their eating pork. There are few acts which Christians and Europeans regard with more unaffected disgust, than Mussulmans regard this particular mode of satisfying hunger. It is, in the first place, an offence against their religion; but this circumstance by no means explains either the degree or the kind of their repugnance; for wine also is

forbidden by their religion, and to partake of it is by all Mussulmans accounted wrong, but not disgusting. Their aversion to the flesh of the "unclean beast" is, on the contrary, of that peculiar character, resembling an instinctive antipathy, which the idea of uncleanness, when once it thoroughly sinks into the feelings, seems always to excite even in those whose personal habits are anything but scrupulously cleanly and of which the sentiment of religious impurity, so intense in the Hindoos, is a remarkable example. Suppose now that in a people, of whom the majority were Mussulmans, that majority should insist upon not permitting pork to be eaten within the limits of the country. This would be nothing new in Mahomedan countries.[1] Would it be a legitimate exercise of the moral authority of public opinion? and if not, why not? The practice is really revolting to such a public. They also sincerely think that it is forbidden and abhorred by the Deity. Neither could the prohibition be censured as religious persecution. It might be religious in its origin, but it would not be persecution for religion, since nobody's religion makes it a duty to eat pork. The only tenable ground of condemnation would be, that with the personal tastes and self-regarding concerns of individuals the public has no business to interfere.

To come somewhat nearer home: the majority of Spaniards consider it a gross impiety, offensive in the highest degree to the Supreme Being, to worship him in any other manner than the Roman Catholic; and no other public worship is lawful on Spanish soil. The people of all Southern Europe look upon a married clergy as not only irreligious, but unchaste, indecent, gross, disgusting. What do Protestants think of these perfectly sincere feelings, and of the attempt to enforce them against non-Catholics? Yet, if mankind are justified in interfering with each other's liberty in things which do not concern the interests of others, on what principle is it possible consistently to exclude these cases? or who can blame people for desiring to suppress what they regard as a scandal in the sight of God and man?

No stronger case can be shown for prohibiting anything which is regarded as a personal immorality, than is made out for suppressing these practices in the eyes of those who regard them as impieties; and unless we are willing to adopt the logic of persecutors, and to say that we may persecute others because we are right, and that they must not persecute us because they are wrong, we must beware of admitting a principle of which we should resent as a gross injustice the application to ourselves.

The preceding instances may be objected to, although unreasonably, as drawn from contingencies impossible among us: opinion, in this country, not being likely to enforce abstinence from meats, or to interfere with people for worshipping, and for either marrying or not marrying, according to their creed or inclination. The next example, however, shall be taken from an interference with liberty which we have by no means passed all danger of. Wherever the Puritans have been sufficiently powerful, as in New England, and in Great Britain at the time of the Commonwealth, they

have endeavored, with considerable success, to put down all public, and nearly all private, amusements: especially music, dancing, public games, or other assemblages for purposes of diversion, and the theatre. There are still in this country large bodies of persons by whose notions of morality and religion these recreations are condemned; and those persons belonging chiefly to the middle class, who are the ascendant power in the present social and political condition of the kingdom, it is by no means impossible that persons of these sentiments may at some time or other command a majority in Parliament. How will the remaining portion of the community like to have the amusements that shall be permitted to them regulated by the religious and moral sentiments of the stricter Calvinists and Methodists? Would they not, with considerable peremptoriness, desire these intrusively pious members of society to mind their own business? This is precisely what should be said to every government and every public, who have the pretension that no person shall enjoy any pleasure which they think wrong. But if the principle of the pretension be admitted, no one can reasonably object to its being acted on in the sense of the majority, or other preponderating power in the country; and all persons must be ready to conform to the idea of a Christian commonwealth, as understood by the early settlers in New England, if a religious profession similar to theirs should ever succeed in regaining its lost ground, as religions supposed to be declining have so often been known to do.

To imagine another contingency, perhaps more likely to be realized than the one last mentioned. There is confessedly a strong tendency in the modern world towards a democratic constitution of society, accompanied or not by popular political institutions. It is affirmed that in the country where this tendency is most completely realized -- where both society and the government are most democratic -- the United States -- the feeling of the majority, to whom any appearance of a more showy or costly style of living than they can hope to rival is disagreeable, operates as a tolerably effectual sumptuary law, and that in many parts of the Union it is really difficult for a person possessing a very large income, to find any mode of spending it, which will not incur popular disapprobation. Though such statements as these are doubtless much exaggerated as a representation of existing facts, the state of things they describe is not only a conceivable and possible, but a probable result of democratic feeling, combined with the notion that the public has a right to a veto on the manner in which individuals shall spend their incomes. We have only further to suppose a considerable diffusion of Socialist opinions, and it may become infamous in the eyes of the majority to possess more property than some very small amount, or any income not earned by manual labor. Opinions similar in principle to these, already prevail widely among the artisan class, and weigh oppressively on those who are amenable to the opinion chiefly of that class, namely, its own members. It is known that the bad workmen who form the majority of the operatives in many branches of industry, are decidedly of opinion that bad workmen ought to receive the same wages as good, and that no one ought to be allowed, through piecework or otherwise, to earn by superior skill or

industry more than others can without it. And they employ a moral police, which occasionally becomes a physical one, to deter skilful workmen from receiving, and employers from giving, a larger remuneration for a more useful service. If the public have any jurisdiction over private concerns, I cannot see that these people are in fault, or that any individual's particular public can be blamed for asserting the same authority over his individual conduct, which the general public asserts over people in general.

But, without dwelling upon supposititious cases, there are, in our own day, gross usurpations upon the liberty of private life actually practised, and still greater ones threatened with some expectation of success, and opinions proposed which assert an unlimited right in the public not only to prohibit by law everything which it thinks wrong, but in order to get at what it thinks wrong, to prohibit any number of things which it admits to be innocent.

Under the name of preventing intemperance the people of one English colony, and of nearly half the United States, have been interdicted by law from making any use whatever of fermented drinks, except for medical purposes: for prohibition of their sale is in fact, as it is intended to be, prohibition of their use. And though the impracticability of executing the law has caused its repeal in several of the States which had adopted it, including the one from which it derives its name, an attempt has notwithstanding been commenced, and is prosecuted with considerable zeal by many of the professed philanthropists, to agitate for a similar law in this country. The association, or "Alliance" as it terms itself, which has been formed for this purpose, has acquired some notoriety through the publicity given to a correspondence between its Secretary and one of the very few English public men who hold that a politician's opinions ought to be founded on principles. Lord Stanley's share in this correspondence is calculated to strengthen the hopes already built on him, by those who know how rare such qualities as are manifested in some of his public appearances, unhappily are among those who figure in political life. The organ of the Alliance, who would "deeply deplore the recognition of any principle which could be wrested to justify bigotry and persecution," undertakes to point out the "broad and impassable barrier" which divides such principles from those of the association. "All matters relating to thought, opinion, conscience, appear to me," he says, "to be without the sphere of legislation; all pertaining to social act, habit, relation, subject only to a discretionary power vested in the State itself, and not in the individual, to be within it." No mention is made of a third class, different from either of these, viz., acts and habits which are not social, but individual; although it is to this class, surely, that the act of drinking fermented liquors belongs. Selling fermented liquors, however, is trading, and trading is a social act. But the infringement complained of is not on the liberty of the seller, but on that of the buyer and consumer; since the State might just as well forbid him to drink wine, as purposely make it impossible for him to obtain it. The Secretary, however, says, "I claim, as a citizen, a right to legislate whenever my social rights are invaded by the

social act of another." And now for the definition of these "social rights." "If anything invades my social rights, certainly the traffic in strong drink does. It destroys my primary right of security, by constantly creating and stimulating social disorder. It invades my right of equality, by deriving a profit from the creation of a misery, I am taxed to support. It impedes my right to free moral and intellectual development, by surrounding my path with dangers, and by weakening and demoralizing society, from which I have a right to claim mutual aid and intercourse." A theory of "social rights," the like of which probably never before found its way into distinct language -- being nothing short of this -- that it is the absolute social right of every individual, that every other individual shall act in every respect exactly as he ought; that whosoever fails thereof in the smallest particular, violates my social right, and entitles me to demand from the legislature the removal of the grievance. So monstrous a principle is far more dangerous than any single interference with liberty; there is no violation of liberty which it would not justify; it acknowledges no right to any freedom whatever, except perhaps to that of holding opinions in secret, without ever disclosing them; for the moment an opinion which I consider noxious, passes any one's lips, it invades all the "social rights" attributed to me by the Alliance. The doctrine ascribes to all mankind a vested interest in each other's moral, intellectual, and even physical perfection, to be defined by each claimant according to his own standard.

Another important example of illegitimate interference with the rightful liberty of the individual, not simply threatened, but long since carried into triumphant effect, is Sabbatarian legislation. Without doubt, abstinence on one day in the week, so far as the exigencies of life permit, from the usual daily occupation, though in no respect religiously binding on any except Jews, is a highly beneficial custom. And inasmuch as this custom cannot be observed without a general consent to that effect among the industrious classes, therefore, in so far as some persons by working may impose the same necessity on others, it may be allowable and right that the law should guarantee to each, the observance by others of the custom, by suspending the greater operations of industry on a particular day. But this justification, grounded on the direct interest which others have in each individual's observance of the practice, does not apply to the self-chosen occupations in which a person may think fit to employ his leisure; nor does it hold good, in the smallest degree, for legal restrictions on amusements. It is true that the amusement of some is the day's work of others; but the pleasure, not to say the useful recreation, of many, is worth the labor of a few, provided the occupation is freely chosen, and can be freely resigned. The operatives are perfectly right in thinking that if all worked on Sunday, seven days' work would have to be given for six days' wages: but so long as the great mass of employments are suspended, the small number who for the enjoyment of others must still work, obtain a proportional increase of earnings; and they are not obliged to follow those occupations, if they prefer leisure to emolument. If a further remedy is sought, it might be found in the

establishment by custom of a holiday on some other day of the week for those particular classes of persons. The only ground, therefore, on which restrictions on Sunday amusements can be defended, must be that they are religiously wrong; a motive of legislation which never can be too earnestly protested against. "Deorum injuriae Diis curae." It remains to be proved that society or any of its officers holds a commission from on high to avenge any supposed offence to Omnipotence, which is not also a wrong to our fellow-creatures. The notion that it is one man's duty that another should be religious, was the foundation of all the religious persecutions ever perpetrated, and if admitted, would fully justify them. Though the feeling which breaks out in the repeated attempts to stop railway travelling on Sunday, in the resistance to the opening of Museums, and the like, has not the cruelty of the old persecutors, the state of mind indicated by it is fundamentally the same. It IS a determination not to tolerate others in doing what is permitted by their religion, because it is not permitted by the persecutor's religion. It is a belief that God not only abominates the act of the misbeliever, but will not hold us guiltless if we leave him unmolested.

I cannot refrain from adding to these examples of the little account commonly made of human liberty, the language of downright persecution which breaks out from the press of this country, whenever it feels called on to notice the remarkable phenomenon of Mormonism. Much might be said on the unexpected and instructive fact, that an alleged new revelation, and a religion, founded on it, the product of palpable imposture, not even supported by the prestige of extraordinary qualities in its founder, is believed by hundreds of thousands, and has been made the foundation of a society, in the age of newspapers, railways, and the electric telegraph. What here concerns us is, that this religion, like other and better religions, has its martyrs; that its prophet and founder was, for his teaching, put to death by a mob; that others of its adherents lost their lives by the same lawless violence; that they were forcibly expelled, in a body, from the country in which they first grew up; while, now that they have been chased into a solitary recess in the midst of a desert, many in this country openly declare that it would be right (only that it is not convenient) to send an expedition against them, and compel them by force to conform to the opinions of other people. The article of the Mormonite doctrine which is the chief provocative to the antipathy which thus breaks through the ordinary restraints of religious tolerance, is its sanction of polygamy; which, though permitted to Mahomedans, and Hindoos, and Chinese, seems to excite unquenchable animosity when practised by persons who speak English, and profess to be a kind of Christians. No one has a deeper disapprobation than I have of this Mormon institution; both for other reasons, and because, far from being in any way countenanced by the principle of liberty, it is a direct infraction of that principle, being a mere riveting of the chains of one half of the community, and an emancipation of the other from reciprocity of obligation towards them. Still, it must be remembered that this relation is as much voluntary on the part of the women concerned in it, and who

may be deemed the sufferers by it, as is the case with any other form of the marriage institution; and however surprising this fact may appear, it has its explanation in the common ideas and customs of the world, which teaching women to think marriage the one thing needful, make it intelligible that many a woman should prefer being one of several wives, to not being a wife at all. Other countries are not asked to recognize such unions, or release any portion of their inhabitants from their own laws on the score of Mormonite opinions. But when the dissentients have conceded to the hostile sentiments of others, far more than could justly be demanded; when they have left the countries to which their doctrines were unacceptable, and established themselves in a remote corner of the earth, which they have been the first to render habitable to human beings; it is difficult to see on what principles but those of tyranny they can be prevented from living there under what laws they please, provided they commit no aggression on other nations, and allow perfect freedom of departure to those who are dissatisfied with their ways. A recent writer, in some respects of considerable merit, proposes (to use his own words,) not a crusade, but a civilizade, against this polygamous community, to put an end to what seems to him a retrograde step in civilization. It also appears so to me, but I am not aware that any community has a right to force another to be civilized. So long as the sufferers by the bad law do not invoke assistance from other communities, I cannot admit that persons entirely unconnected with them ought to step in and require that a condition of things with which all who are directly interested appear to be satisfied, should be put an end to because it is a scandal to persons some thousands of miles distant, who have no part or concern in it. Let them send missionaries, if they please, to preach against it; and let them, by any fair means, (of which silencing the teachers is not one,) oppose the progress of similar doctrines among their own people. If civilization has got the better of barbarism when barbarism had the world to itself, it is too much to profess to be afraid lest barbarism, after having been fairly got under, should revive and conquer civilization. A civilization that can thus succumb to its vanquished enemy must first have become so degenerate, that neither its appointed priests and teachers, nor anybody else, has the capacity, or will take the trouble, to stand up for it. If this be so, the sooner such a civilization receives notice to quit, the better. It can only go on from bad to worse, until destroyed and regenerated (like the Western Empire) by energetic barbarians.

[1] The case of the Bombay Parsees is a curious instance in point. When this industrious and enterprising tribe, the descendants of the Persian fireworshippers, flying from their native country before the Caliphs, arrived in Western India, they were admitted to toleration by the Hindoo sovereigns, on condition of not eating beef. When those regions afterwards fell under the dominion of Mahomedan conquerors, the Parsees obtained from them a continuance of indulgence, on condition of refraining from pork. What was at first obedience to authority became a second nature, and the Parsees to this day abstain both from beef and pork. Though not required by their religion, the

double abstinence has had time to grow into a custom of their tribe; and custom, in the East, is a religion.

Chapter V: Applications

THE principles asserted in these pages must be more generally admitted as the basis for discussion of details, before a consistent application of them to all the various departments of government and morals can be attempted with any prospect of advantage. The few observations I propose to make on questions of detail, are designed to illustrate the principles, rather than to follow them out to their consequences. I offer, not so much applications, as specimens of application; which may serve to bring into greater clearness the meaning and limits of the two maxims which together form the entire doctrine of this Essay and to assist the judgment in holding the balance between them, in the cases where it appears doubtful which of them is applicable to the case.

The maxims are, first, that the individual is not accountable to society for his actions, in so far as these concern the interests of no person but himself. Advice, instruction, persuasion, and avoidance by other people, if thought necessary by them for their own good, are the only measures by which society can justifiably express its dislike or disapprobation of his conduct. Secondly, that for such actions as are prejudicial to the interests of others, the individual is accountable, and may be subjected either to social or to legal punishments, if society is of opinion that the one or the other is requisite for its protection.

In the first place, it must by no means be supposed, because damage, or probability of damage, to the interests of others, can alone justify the interference of society, that therefore it always does justify such interference. In many cases, an individual, in pursuing a legitimate object, necessarily and therefore legitimately causes pain or loss to others, or intercepts a good which they had a reasonable hope of obtaining. Such oppositions of interest between individuals often arise from bad social institutions, but are unavoidable while those institutions last; and some would be unavoidable under any institutions. Whoever succeeds in an overcrowded profession, or in a competitive examination; whoever is preferred to another in any contest for an object which both desire, reaps benefit from the loss of others, from their wasted exertion and their disappointment. But it is, by common admission, better for the general interest of mankind, that persons should pursue their objects undeterred by this sort of consequences. In other words, society admits no right, either legal or moral, in the disappointed competitors, to immunity from this kind of suffering; and feels called on to interfere, only when means of success have been employed which it is contrary to the general interest to permit -- namely, fraud or treachery, and force.

Again, trade is a social act. Whoever undertakes to

sell any description of goods to the public, does what affects the interest of other persons, and of society in general; and thus his conduct, in principle, comes within the jurisdiction of society: accordingly, it was once held to be the duty of governments, in all cases which were considered of importance, to fix prices, and regulate the processes of manufacture. But it is now recognized, though not till after a long struggle, that both the cheapness and the good quality of commodities are most effectually provided for by leaving the producers and sellers perfectly free, under the sole check of equal freedom to the buyers for supplying themselves elsewhere. This is the so-called doctrine of Free Trade, which rests on grounds different from, though equally solid with, the principle of individual liberty asserted in this Essay. Restrictions on trade, or on production for purposes of trade, are indeed restraints; and all restraint, qua restraint, is an evil: but the restraints in question affect only that part of conduct which society is competent to restrain, and are wrong solely because they do not really produce the results which it is desired to produce by them. As the principle of individual liberty is not involved in the doctrine of Free Trade so neither is it in most of the questions which arise respecting the limits of that doctrine: as for example, what amount of public control is admissible for the prevention of fraud by adulteration; how far sanitary precautions, or arrangements to protect work-people employed in dangerous occupations, should be enforced on employers. Such questions involve considerations of liberty, only in so far as leaving people to themselves is always better, caeteris paribus, than controlling them: but that they may be legitimately controlled for these ends, is in principle undeniable. On the other hand, there are questions relating to interference with trade which are essentially questions of liberty; such as the Maine Law, already touched upon; the prohibition of the importation of opium into China; the restriction of the sale of poisons; all cases, in short, where the object of the interference is to make it impossible or difficult to obtain a particular commodity. These interferences are objectionable, not as infringements on the liberty of the producer or seller, but on that of the buyer.

One of these examples, that of the sale of poisons, opens a new question; the proper limits of what may be called the functions of police; how far liberty may legitimately be invaded for the prevention of crime, or of accident. It is one of the undisputed functions of government to take precautions against crime before it has been committed, as well as to detect and punish it afterwards. The preventive function of government, however, is far more liable to be abused, to the prejudice of liberty, than the punitory function; for there is hardly any part of the legitimate freedom of action of a human being which would not admit of being represented, and fairly too, as increasing the facilities for some form or other of delinquency. Nevertheless, if a public authority, or even a private person, sees any one evidently preparing to commit a crime, they are not bound to look on inactive until the crime is committed, but may interfere to prevent it. If poisons were never bought or used for any purpose except the commission of murder, it would be right to prohibit their

manufacture and sale. They may, however, be wanted not only for innocent but for useful purposes, and restrictions cannot be imposed in the one case without operating in the other. Again, it is a proper office of public authority to guard against accidents. If either a public officer or any one else saw a person attempting to cross a bridge which had been ascertained to be unsafe, and there were no time to warn him of his danger, they might seize him and turn him back without any real infringement of his liberty; for liberty consists in doing what one desires, and he does not desire to fall into the river. Nevertheless, when there is not a certainty, but only a danger of mischief, no one but the person himself can judge of the sufficiency of the motive which may prompt him to incur the risk: in this case, therefore, (unless he is a child, or delirious, or in some state of excitement or absorption incompatible with the full use of the reflecting faculty,) he ought, I conceive, to be only warned of the danger; not forcibly prevented from exposing himself to it. Similar considerations, applied to such a question as the sale of poisons, may enable us to decide which among the possible modes of regulation are or are not contrary to principle. Such a precaution, for example, as that of labelling the drug with some word expressive of its dangerous character, may be enforced without violation of liberty: the buyer cannot wish not to know that the thing he possesses has poisonous qualities. But to require in all cases the certificate of a medical practitioner, would make it sometimes impossible, always expensive, to obtain the article for legitimate uses. The only mode apparent to me, in which difficulties may be thrown in the way of crime committed through this means, without any infringement, worth taking into account, Upon the liberty of those who desire the poisonous substance for other purposes, consists in providing what, in the apt language of Bentham, is called "preappointed evidence." This provision is familiar to every one in the case of contracts. It is usual and right that the law, when a contract is entered into, should require as the condition of its enforcing performance, that certain formalities should be observed, such as signatures, attestation of witnesses, and the like, in order that in case of subsequent dispute, there may be evidence to prove that the contract was really entered into, and that there was nothing in the circumstances to render it legally invalid: the effect being, to throw great obstacles in the way of fictitious contracts, or contracts made in circumstances which, if known, would destroy their validity. Precautions of a similar nature might be enforced in the sale of articles adapted to be instruments of crime. The seller, for example, might be required to enter in a register the exact time of the transaction, the name and address of the buyer, the precise quality and quantity sold; to ask the purpose for which it was wanted, and record the answer he received. When there was no medical prescription, the presence of some third person might be required, to bring home the fact to the purchaser, in case there should afterwards be reason to believe that the article had been applied to criminal purposes. Such regulations would in general be no material impediment to obtaining the article, but a very considerable one to making an improper use of it without detection.

The right inherent in society, to ward off crimes against itself by antecedent precautions, suggests the obvious limitations to the maxim, that purely self-regarding misconduct cannot properly be meddled with in the way of prevention or punishment. Drunkennesses, for example, in ordinary cases, is not a fit subject for legislative interference; but I should deem it perfectly legitimate that a person, who had once been convicted of any act of violence to others under the influence of drink, should be placed under a special legal restriction, personal to himself; that if he were afterwards found drunk, he should be liable to a penalty, and that if when in that state he committed another offence, the punishment to which he would be liable for that other offence should be increased in severity. The making himself drunk, in a person whom drunkenness excites to do harm to others, is a crime against others. So, again, idleness, except in a person receiving support from the public, or except when it constitutes a breach of contract, cannot without tyranny be made a subject of legal punishment; but if either from idleness or from any other avoidable cause, a man fails to perform his legal duties to others, as for instance to support his children, it is no tyranny to force him to fulfil that obligation, by compulsory labor, if no other means are available.

Again, there are many acts which, being directly injurious only to the agents themselves, ought not to be legally interdicted, but which, if done publicly, are a violation of good manners, and coming thus within the category of offences against others, may rightfully be prohibited. Of this kind are offences against decency; on which it is unnecessary to dwell, the rather as they are only connected indirectly with our subject, the objection to publicity being equally strong in the case of many actions not in themselves condemnable, nor supposed to be so.

There is another question to which an answer must be found, consistent with the principles which have been laid down. In cases of personal conduct supposed to be blameable, but which respect for liberty precludes society from preventing or punishing, because the evil directly resulting falls wholly on the agent; what the agent is free to do, ought other persons to be equally free to counsel or instigate? This question is not free from difficulty. The case of a person who solicits another to do an act, is not strictly a case of self-regarding conduct. To give advice or offer inducements to any one, is a social act, and may therefore, like actions in general which affect others, be supposed amenable to social control. But a little reflection corrects the first impression, by showing that if the case is not strictly within the definition of individual liberty, yet the reasons on which the principle of individual liberty is grounded, are applicable to it. If people must be allowed, in whatever concerns only themselves, to act as seems best to themselves at their own peril, they must equally be free to consult with one another about what is fit to be so done; to exchange opinions, and give and receive suggestions. Whatever it is permitted to do, it must be permitted to advise to do. The question is doubtful, only when the instigator derives a personal benefit from his advice; when he makes it his occupation, for subsistence, or

pecuniary gain, to promote what society and the State consider to be an evil. Then, indeed, a new element of complication is introduced; namely, the existence of classes of persons with an interest opposed to what is considered as the public weal, and whose mode of living is grounded on the counteraction of it. Ought this to be interfered with, or not? Fornication, for example, must be tolerated, and so must gambling; but should a person be free to be a pimp, or to keep a gambling-house? The case is one of those which lie on the exact boundary line between two principles, and it is not at once apparent to which of the two it properly belongs. There are arguments on both sides. On the side of toleration it may be said, that the fact of following anything as an occupation, and living or profiting by the practice of it, cannot make that criminal which would otherwise be admissible; that the act should either be consistently permitted or consistently prohibited; that if the principles which we have hitherto defended are true, society has no business, as society, to decide anything to be wrong which concerns only the individual; that it cannot go beyond dissuasion, and that one person should be as free to persuade, as another to dissuade. In opposition to this it may be contended, that although the public, or the State, are not warranted in authoritatively deciding, for purposes of repression or punishment, that such or such conduct affecting only the interests of the individual is good or bad, they are fully justified in assuming, if they regard it as bad, that its being so or not is at least a disputable question: That, this being supposed, they cannot be acting wrongly in endeavoring to exclude the influence of solicitations which are not disinterested, of instigators who cannot possibly be impartial -- who have a direct personal interest on one side, and that side the one which the State believes to be wrong, and who confessedly promote it for personal objects only. There can surely, it may be urged, be nothing lost, no sacrifice of good, by so ordering matters that persons shall make their election, either wisely or foolishly, on their own prompting, as free as possible from the arts of persons who stimulate their inclinations for interested purposes of their own. Thus (it may be said) though the statutes respecting unlawful games are utterly indefensible -- though all persons should be free to gamble in their own or each other's houses, or in any place of meeting established by their own subscriptions, and open only to the members and their visitors -- yet public gambling-houses should not be permitted. It is true that the prohibition is never effectual, and that whatever amount of tyrannical power is given to the police, gamblinghouses can always be maintained under other pretences; but they may be compelled to conduct their operations with a certain degree of secrecy and mystery, so that nobody knows anything about them but those who seek them; and more than this society ought not to aim at. There is considerable force in these arguments. I will not venture to decide whether they are sufficient to justify the moral anomaly of punishing the accessary, when the principal is (and must be) allowed to go free; of fining or imprisoning the procurer, but not the fornicator, the gambling-house keeper, but not the gambler. Still less ought the common operations of buying and selling to be interfered with on analogous grounds. Almost every article which is bought and

sold may be used in excess, and the sellers have a pecuniary interest in encouraging that excess; but no argument can be founded on this, in favor, for instance, of the Maine Law; because the class of dealers in strong drinks, though interested in their abuse, are indispensably required for the sake of their legitimate use. The interest, however, of these dealers in promoting intemperance is a real evil, and justifies the State in imposing restrictions and requiring guarantees, which but for that justification would be infringements of legitimate liberty.

A further question is, whether the State while it permits, should nevertheless indirectly discourage conduct which it deems contrary to the best interests of the agent; whether, for example, it should take measures to render the means of drunkenness more costly, or add to the difficulty of procuring them, by limiting the number of the places of sale. On this as on most other practical questions, many distinctions require to be made. To tax stimulants for the sole purpose of making them more difficult to be obtained, is a measure differing only in degree from their entire prohibition; and would be justifiable only if that were justifiable. Every increase of cost is a prohibition, to those whose means do not come up to the augmented price; and to those who do, it is a penalty laid on them for gratifying a particular taste. Their choice of pleasures, and their mode of expending their income, after satisfying their legal and moral obligations to the State and to individuals, are their own concern, and must rest with their own judgment. These considerations may seem at first sight to condemn the selection of stimulants as special subjects of taxation for purposes of revenue. But it must be remembered that taxation for fiscal purposes is absolutely inevitable; that in most countries it is necessary that a considerable part of that taxation should be indirect; that the State, therefore, cannot help imposing penalties, which to some persons may be prohibitory, on the use of some articles of consumption. It is hence the duty of the State to consider, in the imposition of taxes, what commodities the consumers can best spare; and a fortiori, to select in preference those of which it deems the use, beyond a very moderate quantity, to be positively injurious. Taxation, therefore, of stimulants, up to the point which produces the largest amount of revenue (supposing that the State needs all the revenue which it yields) is not only admissible, but to be approved of.

The question of making the sale of these commodities a more or less exclusive privilege, must be answered differently, according to the purposes to which the restriction is intended to be subservient. All places of public resort require the restraint of a police, and places of this kind peculiarly, because offences against society are especially apt to originate there. It is, therefore, fit to confine the power of selling these commodities (at least for consumption on the spot) to persons of known or vouched-for respectability of conduct; to make such regulations respecting hours of opening and closing as may be requisite for public surveillance, and to withdraw the license if breaches of the peace repeatedly take place through the connivance or incapacity of the keeper of the house, or if it becomes a rendezvous for concocting and preparing

offences against the law. Any further restriction I do not conceive to be, in principle, justifiable. The limitation in number, for instance, of beer and spirit-houses, for the express purpose of rendering them more difficult of access, and diminishing the occasions of temptation, not only exposes all to an inconvenience because there are some by whom the facility would be abused, but is suited only to a state of society in which the laboring classes are avowedly treated as children or savages, and placed under an education of restraint, to fit them for future admission to the privileges of freedom. This is not the principle on which the laboring classes are professedly governed in any free country; and no person who sets due value on freedom will give his adhesion to their being so governed, unless after all efforts have been exhausted to educate them for freedom and govern them as freemen, and it has been definitively proved that they can only be governed as children. The bare statement of the alternative shows the absurdity of supposing that such efforts have been made in any case which needs be considered here. It is only because the institutions of this country are a mass of inconsistencies, that things find admittance into our practice which belong to the system of despotic, or what is called paternal, government, while the general freedom of our institutions precludes the exercise of the amount of control necessary to render the restraint of any real efficacy as a moral education.

It was pointed out in an early part of this Essay, that the liberty of the individual, in things wherein the individual is alone concerned, implies a corresponding liberty in any number of individuals to regulate by mutual agreement such things as regard them jointly, and regard no persons but themselves. This question presents no difficulty, so long as the will of all the persons implicated remains unaltered; but since that will may change, it is often necessary, even in things in which they alone are concerned, that they should enter into engagements with one another; and when they do, it is fit, as a general rule, that those engagements should be kept. Yet in the laws probably, of every country, this general rule has some exceptions. Not only persons are not held to engagements which violate the rights of third parties, but it is sometimes considered a sufficient reason for releasing them from an engagement, that it is injurious to themselves. In this and most other civilized countries, for example, an engagement by which a person should sell himself, or allow himself to be sold, as a slave, would be null and void; neither enforced by law nor by opinion. The ground for thus limiting his power of voluntarily disposing of his own lot in life, is apparent, and is very clearly seen in this extreme case. The reason for not interfering, unless for the sake of others, with a person's voluntary acts, is consideration for his liberty. His voluntary choice is evidence that what he so chooses is desirable, or at the least endurable, to him, and his good is on the whole best provided for by allowing him to take his own means of pursuing it. But by selling himself for a slave, he abdicates his liberty; he foregoes any future use of it, beyond that single act. He therefore defeats, in his own case, the very purpose which is the justification of

allowing him to dispose of himself. He is no longer free; but is thenceforth in a position which has no longer the presumption in its favor, that would be afforded by his voluntarily remaining in it. The principle of freedom cannot require that he should be free not to be free. It is not freedom, to be allowed to alienate his freedom. These reasons, the force of which is so conspicuous in this peculiar case, are evidently of far wider application; yet a limit is everywhere set to them by the necessities of life, which continually require, not indeed that we should resign our freedom, but that we should consent to this and the other limitation of it. The principle, however, which demands uncontrolled freedom of action in all that concerns only the agents themselves, requires that those who have become bound to one another, in things which concern no third party, should be able to release one another from the engagement: and even without such voluntary release, there are perhaps no contracts or engagements, except those that relate to money or money's worth, of which one can venture to say that there ought to be no liberty whatever of retractation. Baron Wilhelm von Humboldt, in the excellent Essay from which I have already quoted, states it as his conviction, that engagements which involve personal relations or services, should never be legally binding beyond a limited duration of time; and that the most important of these engagements, marriage, having the peculiarity that its objects are frustrated unless the feelings of both the parties are in harmony with it, should require nothing more than the declared will of either party to dissolve it. This subject is too important, and too complicated, to be discussed in a parenthesis, and I touch on it only so far as is necessary for purposes of illustration. If the conciseness and generality of Baron Humboldt's dissertation had not obliged him in this instance to content himself with enunciating his conclusion without discussing the premises, he would doubtless have recognized that the question cannot be decided on grounds so simple as those to which he confines himself. When a person, either by express promise or by conduct, has encouraged another to rely upon his continuing to act in a certain way -- to build expectations and calculations, and stake any part of his plan of life upon that supposition, a new series of moral obligations arises on his part towards that person, which may possibly be overruled, but can not be ignored. And again, if the relation between two contracting parties has been followed by consequences to others; if it has placed third parties in any peculiar position, or, as in the case of marriage, has even called third parties into existence, obligations arise on the part of both the contracting parties towards those third persons, the fulfilment of which, or at all events, the mode of fulfilment, must be greatly affected by the continuance or disruption of the relation between the original parties to the contract. It does not follow, nor can I admit, that these obligations extend to requiring the fulfilment of the contract at all costs to the happiness of the reluctant party; but they are a necessary element in the question; and even if, as Von Humboldt maintains, they ought to make no difference in the legal freedom of the parties to release themselves from the engagement (and I also hold that they ought not to make much difference), they necessarily make a great difference in the

moral freedom. A person is bound to take all these circumstances into account, before resolving on a step which may affect such important interests of others; and if he does not allow proper weight to those interests, he is morally responsible for the wrong. I have made these obvious remarks for the better illustration of the general principle of liberty, and not because they are at all needed on the particular question, which, on the contrary, is usually discussed as if the interest of children was everything, and that of grown persons nothing.

I have already observed that, owing to the absence of any recognized general principles, liberty is often granted where it should be withheld, as well as withheld where it should be granted; and one of the cases in which, in the modern European world, the sentiment of liberty is the strongest, is a case where, in my view, it is altogether misplaced. A person should be free to do as he likes in his own concerns; but he ought not to be free to do as he likes in acting for another under the pretext that the affairs of another are his own affairs. The State, while it respects the liberty of each in what specially regards himself, is bound to maintain a vigilant control over his exercise of any power which it allows him to possess over others. This obligation is almost entirely disregarded in the case of the family relations, a case, in its direct influence on human happiness, more important than all the others taken together. The almost despotic power of husbands over wives needs not be enlarged upon here, because nothing more is needed for the complete removal of the evil, than that wives should have the same rights, and should receive the protection of law in the same manner, as all other persons; and because, on this subject, the defenders of established injustice do not avail themselves of the plea of liberty, but stand forth openly as the champions of power. It is in the case of children, that misapplied notions of liberty are a real obstacle to the fulfilment by the State of its duties. One would almost think that a man's children were supposed to be literally, and not metaphorically, a part of himself, so jealous is opinion of the smallest interference of law with his absolute and exclusive control over them; more jealous than of almost any interference with his own freedom of action: so much less do the generality of mankind value liberty than power. Consider, for example, the case of education. Is it not almost a selfevident axiom, that the State should require and compel the education, up to a certain standard, of every human being who is born its citizen? Yet who is there that is not afraid to recognize and assert this truth? Hardly any one indeed will deny that it is one of the most sacred duties of the parents (or, as law and usage now stand, the father), after summoning a human being into the world, to give to that being an education fitting him to perform his part well in life towards others and towards himself. But while this is unanimously declared to be the father's duty, scarcely anybody, in this country, will bear to hear of obliging him to perform it. Instead of his being required to make any exertion or sacrifice for securing education to the child, it is left to his choice to accept it or not when it is provided gratis! It still remains unrecognized, that to bring a child into existence without a fair prospect of

being able, not only to provide food for its body, but instruction and training for its mind, is a moral crime, both against the unfortunate offspring and against society; and that if the parent does not fulfil this obligation, the State ought to see it fulfilled, at the charge, as far as possible, of the parent.

Were the duty of enforcing universal education once admitted, there would be an end to the difficulties about what the State should teach, and how it should teach, which now convert the subject into a mere battle-field for sects and parties, causing the time and labor which should have been spent in educating, to be wasted in quarrelling about education. If the government would make up its mind to require for every child a good education, it might save itself the trouble of providing one. It might leave to parents to obtain the education where and how they pleased, and content itself with helping to pay the school fees of the poorer classes of children, and defraying the entire school expenses of those who have no one else to pay for them. The objections which are urged with reason against State education, do not apply to the enforcement of education by the State, but to the State's taking upon itself to direct that education: which is a totally different thing. That the whole or any large part of the education of the people should be in State hands, I go as far as any one in deprecating. All that has been said of the importance of individuality of character, and diversity in opinions and modes of conduct, involves, as of the same unspeakable importance, diversity of education. A general State education is a mere contrivance for moulding people to be exactly like one another: and as the mould in which it casts them is that which pleases the predominant power in the government, whether this be a monarch, a priesthood, an aristocracy, or the majority of the existing generation, in proportion as it is efficient and successful, it establishes a despotism over the mind, leading by natural tendency to one over the body. An education established and controlled by the State, should only exist, if it exist at all, as one among many competing experiments, carried on for the purpose of example and stimulus, to keep the others up to a certain standard of excellence. Unless, indeed, when society in general is in so backward a state that it could not or would not provide for itself any proper institutions of education, unless the government undertook the task; then, indeed, the government may, as the less of two great evils, take upon itself the business of schools and universities, as it may that of joint-stock companies, when private enterprise, in a shape fitted for undertaking great works of industry does not exist in the country. But in general, if the country contains a sufficient number of persons qualified to provide education under government auspices, the same persons would be able and willing to give an equally good education on the voluntary principle, under the assurance of remuneration afforded by a law rendering education compulsory, combined with State aid to those unable to defray the expense.

The instrument for enforcing the law could be no other than public examinations, extending to all children, and beginning at an early age. An age might be fixed at which every child must be examined, to ascertain if he (or she) is

able to read. If a child proves unable, the father, unless he has some sufficient ground of excuse, might be subjected to a moderate fine, to be worked out, if necessary, by his labor, and the child might be put to school at his expense. Once in every year the examination should be renewed, with a gradually extending range of subjects, so as to make the universal acquisition, and what is more, retention, of a certain minimum of general knowledge, virtually compulsory. Beyond that minimum, there should be voluntary examinations on all subjects, at which all who come up to a certain standard of proficiency might claim a certificate. To prevent the State from exercising through these arrangements, an improper influence over opinion, the knowledge required for passing an examination (beyond the merely instrumental parts of knowledge, such as languages and their use) should, even in the higher class of examinations, be confined to facts and positive science exclusively. The examinations on religion, politics, or other disputed topics, shouLd not turn on the truth or falsehood of opinions, but on the matter of fact that such and such an opinion is held, on such grounds, by such authors, or schools, or churches. Under this system, the rising generation would be no worse off in regard to all disputed truths, than they are at present; they would be brought up either churchmen or dissenters as they now are, the State merely taking care that they should be instructed churchmen, or instructed dissenters. There would be nothing to hinder them from being taught religion, if their parents chose, at the same schools where they were taught other things. All attempts by the State to bias the conclusions of its citizens on disputed subjects, are evil; but it may very properly offer to ascertain and certify that a person possesses the knowledge requisite to make his conclusions, on any given subject, worth attending to. A student of philosophy would be the better for being able to stand an examination both in Locke and in Kant, whichever of the two he takes up with, or even if with neither: and there is no reasonable objection to examining an atheist in the evidences of Christianity, provided he is not required to profess a belief in them. The examinations, however, in the higher branches of knowledge should, I conceive, be entirely voluntary. It would be giving too dangerous a power to governments, were they allowed to exclude any one from professions, even from the profession of teacher, for alleged deficiency of qualifications: and I think, with Wilhelm von Humboldt, that degrees, or other public certificates of scientific or professional acquirements, should be given to all who present themselves for examination, and stand the test; but that such certificates should confer no advantage over competitors, other than the weight which may be attached to their testimony by public opinion.

It is not in the matter of education only that misplaced notions of liberty prevent moral obligations on the part of parents from being recognized, and legal obligations from being imposed, where there are the strongest grounds for the former always, and in many cases for the latter also. The fact itself, of causing the existence of a human being, is one of the most responsible actions in the range of human life. To undertake this

responsibility -- to bestow a life which may be either a curse or a blessing -- unless the being on whom it is to be bestowed will have at least the ordinary chances of a desirable existence, is a crime against that being. And in a country either over-peopled or threatened with being so, to produce children, beyond a very small number, with the effect of reducing the reward of labor by their competition, is a serious offence against all who live by the remuneration of their labor. The laws which, in many countries on the Continent, forbid marriage unless the parties can show that they have the means of supporting a family, do not exceed the legitimate powers of the State: and whether such laws be expedient or not (a question mainly dependent on local circumstances and feelings), they are not objectionable as violations of liberty. Such laws are interferences of the State to prohibit a mischievous act -- an act injurious to others, which ought to be a subject of reprobation, and social stigma, even when it is not deemed expedient to superadd legal punishment. Yet the current ideas of liberty, which bend so easily to real infringements of the freedom of the individual, in things which concern only himself, would repel the attempt to put any restraint upon his inclinations when the consequence of their indulgence is a life, or lives, of wretchedness and depravity to the offspring, with manifold evils to those sufficiently within reach to be in any way affected by their actions. When we compare the strange respect of mankind for liberty, with their strange want of respect for it, we might imagine that a man had an indispensable right to do harm to others, and no right at all to please himself without giving pain to any one.

I have reserved for the last place a large class of questions respecting the limits of government interference, which, though closely connected with the subject of this Essay, do not, in strictness, belong to it. These are cases in which the reasons against interference do not turn upon the principle of liberty: the question is not about restraining the actions of individuals, but about helping them: it is asked whether the government should do, or cause to be done, something for their benefit, instead of leaving it to be done by themselves, individually, or in voluntary combination.

The objections to government interference, when it is not such as to involve infringement of liberty, may be of three kinds.

The first is, when the thing to be done is likely to be better done by individuals than by the government. Speaking generally, there is no one so fit to conduct any business, or to determine how or by whom it shall be conducted, as those who are personally interested in it. This principle condemns the interferences, once so common, of the legislature, or the officers of government, with the ordinary processes of industry. But this part of the subject has been sufficiently enlarged upon by political economists, and is not particularly related to the principles of this Essay.

The second objection is more nearly allied to our

subject. In many cases, though individuals may not do the particular thing so well, on the average, as the officers of government, it is nevertheless desirable that it should be done by them, rather than by the government, as a means to their own mental education -- a mode of strengthening their active faculties, exercising their judgment, and giving them a familiar knowledge of the subjects with which they are thus left to deal. This is a principal, though not the sole, recommendation of jury trial (in cases not political); of free and popular local and municipal institutions; of the conduct of industrial and philanthropic enterprises by voluntary associations. These are not questions of liberty, and are connected with that subject only by remote tendencies; but they are questions of development. It belongs to a different occasion from the present to dwell on these things as parts of national education; as being, in truth, the peculiar training of a citizen, the practical part of the political education of a free people, taking them out of the narrow circle of personal and family selfishness, and accustoming them to the comprehension of joint interests, the management of joint concerns -- habituating them to act from public or semipublic motives, and guide their conduct by aims which unite instead of isolating them from one another. Without these habits and powers, a free constitution can neither be worked nor preserved, as is exemplified by the too-often transitory nature of political freedom in countries where it does not rest upon a sufficient basis of local liberties. The management of purely local business by the localities, and of the great enterprises of industry by the union of those who voluntarily supply the pecuniary means, is further recommended by all the advantages which have been set forth in this Essay as belonging to individuality of development, and diversity of modes of action. Government operations tend to be everywhere alike. With individuals and voluntary associations, on the contrary, there are varied experiments, and endless diversity of experience. What the State can usefully do, is to make itself a central depository, and active circulator and diffuser, of the experience resulting from many trials. Its business is to enable each experimentalist to benefit by the experiments of others, instead of tolerating no experiments but its own.

The third, and most cogent reason for restricting the interference of government, is the great evil of adding unnecessarily to its power. Every function superadded to those already exercised by the government, causes its influence over hopes and fears to be more widely diffused, and converts, more and more, the active and ambitious part of the public into hangers-on of the government, or of some party which aims at becoming the government. If the roads, the railways, the banks, the insurance offices, the great joint-stock companies, the universities, and the public charities, were all of them branches of the government; if, in addition, the municipal corporations and local boards, with all that now devolves on them, became departments of the central administration; if the employes of all these different enterprises were appointed and paid by the government, and looked to the government for every rise in life; not all the freedom of the press and popular constitution of the legislature would make this or any other

country free otherwise than in name. And the evil would be greater, the more efficiently and scientifically the administrative machinery was constructed -- the more skilful the arrangements for obtaining the best qualified hands and heads with which to work it. In England it has of late been proposed that all the members of the civil service of government should be selected by competitive examination, to obtain for those employments the most intelligent and instructed persons procurable; and much has been said and written for and against this proposal. One of the arguments most insisted on by its opponents is that the occupation of a permanent official servant of the State does not hold out sufficient prospects of emolument and importance to attract the highest talents, which will always be able to find a more inviting career in the professions, or in the service of companies and other public bodies. One would not have been surprised if this argument had been used by the friends of the proposition, as an answer to its principal difficulty. Coming from the opponents it is strange enough. What is urged as an objection is the safety-valve of the proposed system. If indeed all the high talent of the country could be drawn into the service of the government, a proposal tending to bring about that result might well inspire uneasiness. If every part of the business of society which required organized concert, or large and comprehensive views, were in the hands of the government, and if government offices were universally filled by the ablest men, all the enlarged culture and practised intelligence in the country, except the purely speculative, would be concentrated in a numerous bureaucracy, to whom alone the rest of the community would look for all things: the multitude for direction and dictation in all they had to do; the able and aspiring for personal advancement. To be admitted into the ranks of this bureaucracy, and when admitted, to rise therein, would be the sole objects of ambition. Under this regime, not only is the outside public ill-qualified, for want of practical experience, to criticize or check the mode of operation of the bureaucracy, but even if the accidents of despotic or the natural working of popular institutions occasionally raise to the summit a ruler or rulers of reforming inclinations, no reform can be effected which is contrary to the interest of the bureaucracy. Such is the melancholy condition of the Russian empire, as is shown in the accounts of those who have had sufficient opportunity of observation. The Czar himself is powerless against the bureaucratic body: he can send any one of them to Siberia, but he cannot govern without them, or against their will. On every decree of his they have a tacit veto, by merely refraining from carrying it into effect. In countries of more advanced civilization and of a more insurrectionary spirit the public, accustomed to expect everything to be done for them by the State, or at least to do nothing for themselves without asking from the State not only leave to do it, but even how it is to be done, naturally hold the State responsible for all evil which befalls them, and when the evil exceeds their amount of patience, they rise against the government and make what is called a revolution; whereupon somebody else, with or without legitimate authority from the nation, vaults into the seat, issues his orders to the bureaucracy, and everything goes on much as it did before; the bureaucracy

being unchanged, and nobody else being capable of taking their place.

A very different spectacle is exhibited among a people accustomed to transact their own business. In France, a large part of the people having been engaged in military service, many of whom have held at least the rank of noncommissioned officers, there are in every popular insurrection several persons competent to take the lead, and improvise some tolerable plan of action. What the French are in military affairs, the Americans are in every kind of civil business; let them be left without a government, every body of Americans is able to improvise one, and to carry on that or any other public business with a sufficient amount of intelligence, order and decision. This is what every free people ought to be: and a people capable of this is certain to be free; it will never let itself be enslaved by any man or body of men because these are able to seize and pull the reins of the central administration. No bureaucracy can hope to make such a people as this do or undergo anything that they do not like. But where everything is done through the bureaucracy, nothing to which the bureaucracy is really adverse can be done at all. The constitution of such countries is an organization of the experience and practical ability of the nation, into a disciplined body for the purpose of governing the rest; and the more perfect that organization is in itself, the more successful in drawing to itself and educating for itself the persons of greatest capacity from all ranks of the community, the more complete is the bondage of all, the members of the bureaucracy included. For the governors are as much the slaves of their organization and discipline, as the governed are of the governors. A Chinese mandarin is as much the tool and creature of a despotism as the humblest cultivator. An individual Jesuit is to the utmost degree of abasement the slave of his order though the order itself exists for the collective power and importance of its members.

It is not, also, to be forgotten, that the absorption of all the principal ability of the country into the governing body is fatal, sooner or later, to the mental activity and progressiveness of the body itself. Banded together as they are -- working a system which, like all systems, necessarily proceeds in a great measure by fixed rules -- the official body are under the constant temptation of sinking into indolent routine, or, if they now and then desert that mill-horse round, of rushing into some half-examined crudity which has struck the fancy of some leading member of the corps: and the sole check to these closely allied, though seemingly opposite, tendencies, the only stimulus which can keep the ability of the body itself up to a high standard, is liability to the watchful criticism of equal ability outside the body. It is indispensable, therefore, that the means should exist, independently of the government, of forming such ability, and furnishing it with the opportunities and experience necessary for a correct judgment of great practical affairs. If we would possess permanently a skilful and efficient body of functionaries -- above all, a body able to originate and willing to adopt improvements; if we would not have our bureaucracy degenerate into a pedantocracy, this body must not engross

all the occupations which form and cultivate the faculties required for the government of mankind.

To determine the point at which evils, so formidable to human freedom and advancement begin, or rather at which they begin to predominate over the benefits attending the collective application of the force of society, under its recognized chiefs, for the removal of the obstacles which stand in the way of its well-being, to secure as much of the advantages of centralized power and intelligence, as can be had without turning into governmental channels too great a proportion of the general activity, is one of the most difficult and complicated questions in the art of government. It is, in a great measure, a question of detail, in which many and various considerations must be kept in view, and no absolute rule can be laid down. But I believe that the practical principle in which safety resides, the ideal to be kept in view, the standard by which to test all arrangements intended for overcoming the difficulty, may be conveyed in these words: the greatest dissemination of power consistent with efficiency; but the greatest possible centralization of information, and diffusion of it from the centre. Thus, in municipal administration, there would be, as in the New England States, a very minute division among separate officers, chosen by the localities, of all business which is not better left to the persons directly interested; but besides this, there would be, in each department of local affairs, a central superintendence, forming a branch of the general government. The organ of this superintendence would concentrate, as in a focus, the variety of information and experience derived from the conduct of that branch of public business in all the localities, from everything analogous which is done in foreign countries, and from the general principles of political science. This central organ should have a right to know all that is done, and its special duty should be that of making the knowledge acquired in one place available for others. Emancipated from the petty prejudices and narrow views of a locality by its elevated position and comprehensive sphere of observation, its advice would naturally carry much authority; but its actual power, as a permanent institution, should, I conceive, be limited to compelling the local officers to obey the laws laid down for their guidance. In all things not provided for by general rules, those officers should be left to their own judgment, under responsibility to their constituents. For the violation of rules, they should be responsible to law, and the rules themselves should be laid down by the legislature; the central administrative authority only watching over their execution, and if they were not properly carried into effect, appealing, according to the nature of the case, to the tribunal to enforce the law, or to the constituencies to dismiss the functionaries who had not executed it according to its spirit. Such, in its general conception, is the central superintendence which the Poor Law Board is intended to exercise over the administrators of the Poor Rate throughout the country. Whatever powers the Board exercises beyond this limit, were right and necessary in that peculiar case, for the cure of rooted habits of mal-administration in matters deeply affecting not the localities merely, but the whole community; since no locality has a moral right to make

itself by mismanagement a nest of pauperism, necessarily overflowing into other localities, and impairing the moral and physical condition of the whole laboring community. The powers of administrative coercion and subordinate legislation possessed by the Poor Law Board (but which, owing to the state of opinion on the subject, are very scantily exercised by them), though perfectly justifiable in a case of a first-rate national interest, would be wholly out of place in the superintendence of interests purely local. But a central organ of information and instruction for all the localities, would be equally valuable in all departments of administration. A government cannot have too much of the kind of activity which does not impede, but aids and stimulates, individual exertion and development. The mischief begins when, instead of calling forth the activity and powers of individuals and bodies, it substitutes its own activity for theirs; when, instead of informing, advising, and upon occasion denouncing, it makes them work in fetters or bids them stand aside and does their work instead of them. The worth of a State, in the long run, is the worth of the individuals composing it; and a State which postpones the interests of their mental expansion and elevation, to a little more of administrative skill or that semblance of it which practice gives, in the details of business; a State, which dwarfs its men, in order that they may be more docile instruments in its hands even for beneficial purposes, will find that with small men no great thing can really be accomplished; and that the perfection of machinery to which it has sacrificed everything, will in the end avail it nothing, for want of the vital power which, in order that the machine might work more smoothly, it has preferred to banish.

Presocratic Fragments and Testimonials

 This text file is adapted from passages in John Burnet's *Early Greek Philosophy* (1892). This is a working draft; please report errors.[1]

ANAXIMANDER

Testimonials

(1) Anaximander of Miletus, son of Praxiades, a fellow-citizen and associate of Thales, said that the material cause and first element of things was the Infinite, he being the first to introduce this name of the material cause. He says it is neither water nor any other of the so-called elements, but a substance different from them which is infinite, from which arise all the heavens and the worlds within them. (Theophrastus, *Phys*. *Op*. fr. 2)

(2) He says that this is " eternal and ageless," and that it " encompasses all the worlds." (Hippolytus *Ref*. i. 6)

(3) And into that from which things take their rise they pass away once more, " as is proper; for they make reparation and satisfaction to one another for their injustice according to the ordering of time," as he says in these somewhat poetical terms. (Theophrastus *Phys*. *Op*. fr. 2)

(4) And besides this, there was an eternal motion, in which was brought about the origin of the worlds.

(Hippolytus *Ref*. i. 6)

(5) He did not ascribe the origin of things to any alteration in matter, but said that the oppositions in the substratum, which was a boundless body, were separated out. (Simplicius *Phys*. P. 3150, 20)

(6) Further, there cannot be a single, simple body which is infinite, either, as some hold, one distinct from the elements, which they then derive from it, or without this qualification. For there are some who make this (i.e. a body distinct from the elements) the infinite, and not air or water,- in order that the other things may not be destroyed by their infinity. They are in opposition one to another-air is cold, water moist, and fire hot-and therefore, if any one of them were infinite, the rest would have ceased to be by this time. Accordingly they say that what is infinite is something other than the elements, and from it the elements arise. (Aristotle, *Phys*. 204b 22)

ANAXIMENES

Testimonials

(1) Anaximenes of Miletus, son of Eurystratos, who had been an associate of Anaximander, said, like him, that the underlying substance was one and infinite. He did not, however, say it was indeterminate, like Anaximander, but determinate; for he said it was Air. (Theophrastus, *Phys*. *Op*. fr. 2)

(2) From it, he said, the things that are, and have been, and will be, the gods and things divine, took their rise, while other things come from its offspring. (Hippolytus *Ref*. i. 7)

(3) "Just as," he said, "our soul, being air, holds us together, so do breath and air encompass the whole world." (Aet. i. 3, 4)

(4) And the form of the air is as follows. Where it is most even, it is invisible to our sight; but cold and heat, moisture and motion, make it visible. It is always in motion; for, if it were not, it would not change so much as it does. (Hippolytus *Ref*. i. 7)

(5) It differs in different substances in virtue of its rarefaction and condensation. (Theophrastus, *Phys*. *Op*. fr. 2)

(6) When it is dilated so as to be rarer, it becomes fire; while winds, on the other hand, are condensed Air. Cloud is formed from Air by felting; and this, still further condensed, becomes water. Water, condensed still more, turns to earth; and when condensed as much as it can be, to stones. (Hippolytus *Ref*. i. 7)

XENOPHANES

Fragments (Elegies)

(1) Now is the floor clean, and the hands and cups of all; one sets twisted garlands on our heads, another

hands us fragrant ointment on a salver. The mixing bowl stands ready, full of gladness, and there is more wine at hand that promises never to leave us in the lurch, soft and smelling of flowers in the jars. In the midst the frankincense sends up its holy scent, and there is cold water, sweet and clean. Brown loaves are set before us and a lordly table laden with cheese and rich honey. The altar in the midst is clustered round with flowers; song and festivity fill the halls.

But first it is proper that people should sing to the god with joy, with holy tales and pure words; then after offerings and prayer made that we may have strength to do right -- for that is in truth the first thing to do -- no sin is it to drink as much as a person can take and get home without an attendant, so he be not stricken in years. And of all people is he to be praised who after drinking gives considerable proof of himself in the trial of skill, as memory and strength will serve him. Let him not sing of Titans and Giants -- those fictions of the people of old -- nor of turbulent civil battles in which is no good thing at all; but to give heedful reverence to the gods is always good.

(2) What if a person wins victory in swiftness of foot, or in the pentathlon, at Olympia, where is the region of Zeus by Pisa's springs, or in wrestling -- what if by cruel boxing or that fearful sport people call pankration he become more glorious in the citizens' eyes, and win a place of honor in the sight of all at the games, his food-at the public cost from the state, and a gift to be an heirloom for him-what if he conquer in the chariot-race -- he win not deserve all this for his portion so much as I do. Far better is our art than the strength of men and of horses! These are but thoughtless judgments, nor is it fitting to set strength before considerable art. Even if there arise a mighty boxer among a people, or one great in the pentathlon or at wrestling, or one excelling in swiftness of foot -- and that stands in honor before all tasks of people at the games -- the city would be none the better governed for that. It is but little joy a city gets of it if a person conquer at the games by Pisa's banks; it is not this that makes fat the store-houses of a city.

(3) They learnt dainty and unprofitable ways from the Lydians, so long as they were free from hateful tyranny; they went to the market-place with cloaks of purple dye, not less than a thousand of them all told, conceited and proud of their shapely locks of hair, fragrant from salves.

(4) Nor would a person mix wine in a cup by pouring out the wine first, but water first and wine on the top of it.

(5) You did send the thigh-bone of a kid and get for it the fat leg of a fatted bull, a worthy compensation for a person to get, whose glory is to reach every part of Hellas and never to pass away, so long as Greek songs last.

(7) And now I will turn to another tale and point the way. . . . Once they say that he (Pythagoras) was passing by when a dog was being beaten and spoke this word: "Stop! Don't beat it! For it is the soul of a friend that I recognized when I heard its voice."

(8) There are by this time threescore years and seven that have tossed my careworn soul up and down the land of Hellas; and there were then five-and-twenty years from my birth, if I can say anything truly about these matters.

(9) Much weaker than an aged person.

Fragments (Satires)

(10) Since all at first have learnt according to Homer. . . .

(11) Homer and Hesiod have ascribed to the gods all things that are a shame and a disgrace among mortals, stealings and adulteries and deceivings of one another.

(12) Since they have uttered many lawless deeds of the gods, stealings and adulteries and deceivings of one another.

(14) But mortals deem that the gods are begotten as they are, and have clothes like theirs, and voice and form.

(15) Yes, and if oxen and horses or lions had hands, and could paint with their hands, and produce works of art as people do, horses would paint the forms of the gods like horses, and oxen like oxen, and make their bodies in the image of their several kinds.

(16) The Ethiopians make their gods black and snub-nosed; the Thracians say theirs have blue eyes and red hair.

(18) The gods have not revealed all things to people from the beginning, but by seeking they find in time what is better.

(23) One god, the greatest among gods and humans, neither in form like unto mortals nor in thought. . . .

(24) He sees all over, thinks all over, and hears all over.

(25) But without toil he sways all things by the thought of his mind.

(26) And he abides ever in the selfsame place, moving not at all; nor does it befit him to go about now here, now there.

(27) all things come from the earth, and in earth all things end.

(28) This limit of the earth above is seen at our feet in contact with the air; below it reaches down without a limit.

(29) All things are earth and water that come into being and grow.

(30) The sea is the source of water and the source of wind; for neither in the clouds (would there be any blasts of wind blowing) from within without the mighty sea, nor rivers' streams nor rain-water from the sky. The mighty sea is father of clouds and of winds and of rivers.

(31) The sun swinging over the earth and warming it. . . .

(32) She that they call Iris is a cloud likewise, purple, scarlet and green to observe.

(33) For we all are born of earth and water.

(34) There never was nor will be a person who has certain knowledge about the gods and about all the things I speak of. Even if he should chance to say the complete truth, yet he himself knows not that it is so. But all may have their fancy.

(35) Let these be taken as fancies something like the truth.

(36) all of them that are visible for mortals to observe.

(37) And in some caves water drips. . . .

(38) If god had not made brown honey, people would think that figs are far sweeter than they do think of about them.

Back to the top

HERACLITUS

Fragments

(1) It is wise to listen, not to me, but to my Word, and to confess that all things are one.

(2) Though this word is true always, yet people are as unable to understand it when they hear it for the first time as before they have heard it at all. For, though all things come to pass in accordance with this Word, people seem as if they had no experience of them, when they make trial of words and deeds such as I establish, dividing each thing according to its kind and showing how it truly is. But other people know not what they are doing when awake, even as they forget what they do in sleep.

(3) Fools when they do hear are like the deaf: of them does the saying bear witness that they are absent when present.

(4) Eyes and ears are bad witnesses to people if they have souls that understand not their language.

(5) The many do not take heed of such things as they meet with, nor do they mark them when they are taught, though they think they do.

(6) Knowing not how to listen nor how to speak.

(7) If you do not expect the unexpected, you will not find it for it is hard to be sought out and difficult.

(8) Those who seek for gold dig up much earth and find a little.

(10) Nature loves to hide.

(11) The lord whose is the oracle at Delphi neither utters nor hides his meaning, but shows it by a sign.

(12) And the Sibyl, with raving lips uttering things mirthless, unadorned, and unperfumed, reaches over a thousand years with her voice, thanks to the god in her.

(13) The things that can be seen, heard, and learned are what I prize the most.

(14) . . . bringing untrustworthy witnesses in support of disputed points.

(15) The eyes are more exact witnesses than the ears.

(16) The learning of many things teaches not understanding, else would it have taught Hesiod and Pythagoras, and again Xenophanes and Hekataius.

(17) Pythagoras, son of Mnesarchus, practiced scientific inquiry beyond all other people, and malting a selection of these writings, claimed for his own wisdom what was but a knowledge of many things and an imposture.

(18) Of all whose discussions I have heard, there is not one who attains to understanding that wisdom is apart from all.

(19) Wisdom is one thing. It is to know the thought by which all things are steered through all things.

(20) This world, which is the same for all, no one of gods or humans has made; but it was ever, is now, and ever will be an ever-living Fire, with measures of it kindling, and measures going out.

(21) The transformations of Fire are, first of all, sea; and half of the sea is earth, half whirlwind.

(22) all things are an exchange for Fire, and Fire for all things, even as wares for gold and gold for wares.

(23) It becomes liquid sea, and is measured by the same tale as before it became earth.

(24) Fire is want and excess.

(25) Fire lives the death of air, and air lives the death of fire; water lives the death of earth, earth that of water.

(26) Fire in its advance will judge and convict all things.

(27) How can one hide from that which never sets?

(28) It is the thunderbolt that steers the course of all things.

(29) The sun will not overstep his measures; if he does, the Erinyes, the handmaids of justice, will find him out.

(30) The limit of dawn and evening is the Bear; and opposite the Bear is the boundary of bright Zeus.

(31) If there were no sun it would be night, for all the other stars could do.

(32) The sun is new every day.

(33) Thales foretold an eclipse.

(34) . . . the seasons that bring all things.

(35) Hesiod is most people's teacher. People are sure he knew very many things, a man who did not know day or night! They are one.

(36) God is day and night, winter and summer, war and peace, surfeit and hunger; but he takes various shapes, just as fire, when it is mingled with spices, is named according to the taste of each.

(37) If all things were turned to smoke, the nostrils would distinguish them.

(38) Souls smell in Hades.

(39) Cold things become warm, and what is warm cools; what is wet dries, and the parched is moistened.

(40) It scatters and it gathers; it advances and retires. (41, 42) You cannot step twice into the same rivers; for fresh waters are ever flowing in upon you.

(43) Homer was wrong in saying: "Would that strife might perish from among gods and humans!" He did not see that he was praying for the destruction of the universe; for, if his prayer were heard, all things would pass away. . . .

(44) War is the father of all and the king of all; and some he has made gods and some humans, some bond and some free.

(45) People do not know how what is at variance agrees with itself. It is an attunement of opposite tensions, like that of the bow and the lyre.

(46) It is the opposite which is good for us.

(47) The hidden attunement is better than the open.

(48) Let us not conjecture at random about the greatest things.

(49) People that love wisdom must be acquainted with very many things indeed.

(50) The straight and the crooked path of the fuller's comb is one and the same.

(51) Asses would rather have straw than gold.

(51a) Oxen are happy when they find bitter vetches to eat.

(52) The sea is the purest and the impurest water. Fish can drink it, and it is good for them; to people it is

undrinkable and destructive.

(53) Swine wash in the mire, and barnyard fowls in dust.

(54) . . . to delight in the mire.

(55) Every beast is driven to pasture with blows.

(56) [Same as 45.]

(57) Good and ill are one.

(58) Physicians who cut, burn, stab, and rack the sick, demand a fee for it which they do not deserve to get.

(59) Couples are things whole and things not whole, what is drawn together and what is drawn asunder, the harmonious and the discordant. The one is made up of all things, and all things issue from the one.

(60) People would not have known the name of justice if these things were not.

(61) To God all things are fair and good and right, but people hold some things wrong and some right.

(62) We must know that war is common to all and strife is justice, and that all things come into being and pass away (?) through strife.

(64) all the things we see when awake are death, even as all we see in slumber are sleep.

(65) The wise is one only. It is unwilling and willing to be called by the name of Zeus.

(66) The bow is called life, but its work is death.

(67) Mortals are immortals and immortals are mortals, the one. Living the others' death and dying the others' life.

(68) For it is death to souls to become water, and death to water to become earth. But water comes from earth; and from water, soul.

(69) The way up and the way down is one and the same.

(70) In the circumference of a circle the beginning and end are common.

(71) You will not find the boundaries of soul by traveling in any direction, so deep is the measure of it."

(72) It is pleasure to souls to become moist.

(73) A person, when he gets drunk, is led by a beardless lad, tripping, knowing not where he steps, having his soul moist.

(74-76) The dry soul is the wisest and best.

(77) People set a light for themselves in the night-time, when they have died but are alive. The sleeper, whose vision has been put out, lights up from the dead; he that is awake lights up from the sleeping.

(78) And it is the same thing in us that is quick and dead, awake and asleep, young and old; the former are shifted and become the latter, and the latter in turn are shifted and become the former.

(79) Time is a child playing checkers, the kingly power is a child's.

(80) I have sought for myself.

(81) We step and do not step into the same rivers; we are and are not.

(82) It is a weariness to labor for the same masters and be ruled by them.

(83) It rests by changing.

(84) Even the posset separates if it is not stirred.

(85) Corpses are more fit to be cast out than dung.

(86) When they are born, they wish to live and to meet with their dooms -- or rather to rest -- and they leave children behind them to meet with their dooms in turn.

(87-89) A man may be a grandfather in thirty years.

(90) Those who are asleep are fellow-workers (in what goes on in the world).

(91a) Thought is common to all.

(91b) Those who speak with understanding must hold fast to what is common to all as a city holds fast to its law, and even more strongly. For all human laws are fed by the one divine law. It prevails as much as it will, and suffices for all things with something to spare.

(92) So we must follow the common, yet though my Word is common, the many live as if they had a wisdom of their own.

(93) They are estranged from that with which they have most constant intercourse.

(94) It is not proper to act and speak like people asleep.

(95) The waking have one common world, but the sleeping turn aside each into a world of his own.

(96) The way of humans has no wisdom, but that of God has.

(97) People are called babies by God, even as a child by a person.

(98, 99) The wisest person is an ape compared to God, just as the most beautiful ape is ugly compared to humans.

(100) The people must fight for its law as for its walls.

(101) Greater deaths win greater portions.

(102) Gods and humans honor those who are slain in battle.

(103) Wantonness needs putting out, even more than a house on fire.

(104) It is not good for people to get all they wish to get. It is sickness that makes health pleasant; evil, good; hunger, plenty; weariness, rest.

(105-107) It is hard to fight with one's heart's desire. Whatever it wishes to get, it purchases at the cost of soul.

(108, 109) It is best to hide folly; but it is hard in times of relaxation, over our cups.

(110) And it is law, too, to obey the counsel of one.

(111) For what thought or wisdom have they? They follow the poets and take the crowd as their teacher, knowing not that there are many bad and few good. For even the best of them choose one thing above all others, immortal glory among mortals, while most of them are glutted like beasts.

(112) In Priene lived Bias, son of Teutamas, who is of more account than the rest. (He said, "Most people are bad.")

(113) One is ten thousand to me, if he be the best.

(114) The Ephesians would do well to hang themselves, every grown person of them, and leave the city to beardless lads; for they have cast out Hermodorus, the best person among them, saying, "We will have none who is best among us; if there be any such, let him be so elsewhere and among others."

(115) Dogs bark at every one they do not know.

(116) . . . (The wise person) is not known because of people's want of belief.

(117) The fool is fluttered at every word.

(118) The most esteemed of them knows but fancies, and holds fast to them, yet of a truth justice will overtake the artificers of lies and the false witnesses.

(119) Homer should be turned out of the lists and whipped, and Archilochus likewise.

(120) One day is like any other.

(121) A person's character is his fate.

(122) There awaits people when they die such things as they look not for nor dream of.

(123) . . . that they rise up and become the wakeful guardians of the quick and dead.

(124) Night-walkers, Magians, Bakchoi, Lenai, and the initiated . . .

(125) The mysteries practiced among people are unholy mysteries.

(126) And they pray to these images, as if one were to talk with a person's house, knowing not what gods or heroes are.

(127) For if it were not to Dionysus that they made a procession and sang the shameful phallic hymn, they would be acting most shamelessly. But Hades is the same as Dionysus in whose honor they go mad and rave.

(129, 130) They vainly purify themselves by defiling themselves with blood, just as if one who had stepped into the mud were to wash his feet in mud. Any person who marked him doing thus, would deem him mad.

PARMENIDES

Fragments from *On Nature*

(1) The car that bears me carried me as far as ever my heart desired, when it had brought me and set me on the renowned way of the goddess, which leads the man who knows through all the towns. On that way was I carried along; for on it the wise steeds carried me, drawing my car, and maidens showed the way. And the axle, glowing in the socket -- for it was urged round by the whirling wheels at each end -- gave a sound like a pipe, when the daughters of the Sun, to convey me into the light, threw back their veils from off their faces and left the abode of Night.

There are the gates of the ways of Night and Day, fitted above with a lintel and below with a threshold of stone. They themselves, high in the air, are closed by mighty doors, and Avenging justice keeps the keys that fit them. Her did the maidens entreat with gentle words and cunningly persuade to unfasten without demur the bolted bars from the gates. Then, when the doors were thrown back, they disclosed a wide opening, when their brazen posts fitted with rivets and nails swung back one after the other. Straight through them, on the broad way, did the maidens guide the horses and the car, and the goddess greeted me kindly, and took my right hand in hers, and spoke to me these words:

Welcome, O youth, that come to my abode on the car that bears you tended by immortal charioteers! It is no ill chance, but right and justice that has sent you to travel on this way. Far, indeed, does it lie from the beaten track of people! It is proper for you to learn all things, as well the unshaken heart of well-rounded

truth, as the opinions of mortals in which is no true belief at all. Yet none the less will you learn these things also, -- how passing right through all things one should judge the things that seem to be.

But do you restrain your thought from this way of inquiry, nor let habit by its much experience force you to cast upon this way a wandering eye or sounding ear or tongue; but judge by argument the much disputed proof uttered by me. There is only one way left that can be spoken of ...

The Way of Truth

(2) Look steadfastly with your mind at things though afar as if they were at hand. You can not cut off what is from holding fast to what is, neither scattering itself abroad in order nor coming together.

(3) It is all one to me where I begin; for I will come back again there.

(4, 5) Come now, I will tell you -- and do you listen to my saying and carry it away -- the only two ways of search that can be thought of. The first, namely, that *it is*, and that it is impossible for it not to be, is the way of belief, for truth is its companion. The other, namely, that *it is not*, and that it must needs not be,-that, I tell you, is a path that none can learn of at all. For you can not know what is not-that is impossible-nor utter it; for it is the same thing that can be thought and that can be.

(6) It must be that what can be spoken and thought is; for it is possible for it to be, and it is not possible for what is nothing to be. This is what I bid you ponder. I hold you back from this first way of inquiry, and from this other also, upon which mortals knowing nothing wander two-faced; for helplessness guides the wandering thought in their breasts, so that they are carried along stupefied like people deaf and blind. Unreasonable crowds, who hold that it is and is not the same and not the same, all things travel in opposite directions!

(7) For this will never be proved, that the things that are not are; and do you restrain your thought from this way of inquiry.

(8) One path only is left for us to speak of, namely, that *it is*. In this path are very many tokens that what is is uncreated and indestructible; for it is complete, immovable, and without end. Nor was it ever, nor will it be; for now it is, all at once, a continuous one. For what kind of origin for it will you look for? In what way and from what source could it have drawn its increase? . . . I will not let you say nor think that it came from what is not; for it can neither be thought nor uttered that anything is not. And, if it came from nothing, what need could have made it arise later rather than sooner? Therefore must it either be altogether or be not at all. Nor will the force of truth suffer anything to arise besides itself from that which is not. For this reason, justice does not loose her fetters and let anything come into being or pass away, but holds it fast. Our judgment thereon depends on this: "Is it or is it not?" Surely it is decided, as it must be, that we are to set aside the one way as unthinkable and nameless (for it is no true way), and that the other path is real and true. How, then, can what is be going to be in the future? Or how could it come into being? If it came into being, it is not; nor is it if it is going to be in the future. Thus is becoming extinguished and passing away not to be heard of.

Nor is it divisible, since it is all alike, and there is no more of it in one place than in another, to hinder it from holding together, nor less of it, but everything is full of what is. For this reason it is wholly continuous; for what is, is in contact with what is.

Moreover, it is immovable in the bonds of mighty chains, without beginning and without end; since coming into being and passing away have been driven afar, and true belief has cast them away. It is the same, and it rests in the self-same place, abiding in itself. And thus it remains constant in its place; for hard necessity keeps it in the bonds of the limit that holds it fast on every side. For this reason it is not permitted to what is to be infinite; for it is in need of nothing; while, if it were infinite, it would stand in

need of everything.

The thing that can be thought and that for the sake of which the thought exists is the same; for you cannot find thought without something that is, as to which it is uttered. And there is not, and never will be, anything besides what is, since fate has chained it so as to be whole and immovable. For this reason all these things are but names which mortals have given, believing them to be true-coming into being and passing away, being and not being, change of place and alteration of bright color.

Since, then, it has a furthest limit, it is complete on every side, like the mass of a rounded sphere, equally poised from the center in every direction; for it cannot be greater or smaller in one place than in another. For there is no nothing that could keep it from reaching out equally, nor can anything that is be more here and less there than what is, since it is all inviolable. For the point from which it is equal in every direction tends equally to the limits.

The Way of Belief

Here will I close my trustworthy speech and thought about the truth. In the future, learn the beliefs of mortals, giving ear to the deceptive ordering of my words.

Mortals have made up their minds to name two forms, one of which they should not name, and that is where they go astray from the truth. They have distinguished them as opposite in form, and have assigned to them marks distinct from one another. To the one they give out the fire of heaven, gentle, very light, in every direction the same as itself, but not the same as the other. The other is just the opposite to it, dark night, a compact and heavy body. Of these I tell you the whole arrangement as it seems likely; for so no thought of mortals will ever outstrip you.

(9) Now that all things have been named light and night, and the names which belong to the power of each have been assigned to these things and to those, everything is full at once of light and dark night, both equal, since neither has anything to do with the other.

(10, 11) And you will know the substance of the sky, and all the signs in the sky, and the radiant works of the glowing sun's pure torch, and from where they arose. And you will learn likewise of the wandering deeds of the round-faced moon, and of her substance. You will know, too, the heavens that surround us, from where they arose, and how Necessity took them and bound them to keep the limits of the stars . . . how the earth, and the sun, and the moon, and the sky that is common to all, and the Milky Way, and the outermost Olympus, and the burning might of the stars arose.

(12) The narrower bands were filled with unmixed fire, and those next them with night, and in the midst of these rushes their portion of fire. In the midst of these is the divinity that directs the course of all things; for she is the beginner of all painful birth and all propagation, driving the female to the embrace of the male, and the male to that of the female.

(13) First of all the gods she contrived Eros.

(14) Shining by night with borrowed light, wandering round the earth.

(15) Always looking to the beams of the sun.

(16) For just as thought stands at any time to the mixture of its, erring organs, so does it come to people; for that which thinks is the same, namely, the substance of the limbs, in each and every person; for their thought is that of which there is more in them.

(17) On the right boys; on the left girls.

(19) Thus, according to people's opinions, did things come into being, and thus they are now. In time they will grow up and pass away. To each of these things people have assigned a fixed name.

Back to the top

EMPEDOCLES

Fragments

(1) And do you give ear, Pausanias, son of Anchitus the wise!

(2) For straitened are the powers that are spread over their bodily parts, and many are the woes that burst in on them and blunt the edge of their careful thoughts! They observe but a brief span of a life that is no life, and, doomed to swift death, are taken up and fly off like smoke. Each is convinced of that alone which he had chanced upon as he is hurried every way, and idly boasts he has found the whole. So hardly can these things be seen by the eyes or heard by the ears of people, so hardly grasped by their mind! Nevertheless, you, since you have found your way hither, will learn no more than mortal mind has power.

(3) . . . to keep within your dumb heart.

(4) But, O you gods, turn aside from my tongue the madness of those people. Bless my lips and make a pure stream flow from them I And you, much-wooed, white-armed Virgin Muse, do I urge that I may hear what is lawful for the children of a day I Speed me on my way from the abode of holiness and drive my willing car! You will not lift garlands of glory and honor at the hands of mortals on condition of speaking in your pride beyond that which is lawful and right, and so to gain a seat upon the heights of wisdom.

Go to now, consider with all your powers in what way each thing is clear. Hold not your sight in greater credit as compared with your hearing, nor value your resounding ear above the dear instructions of your tongue; and do not withhold your confidence in any of your other bodily parts by which there is an opening for understanding, but consider everything in the way it is clear.

(5) But it is all too much the way of low minds to disbelieve those better. Do you learn as the sure testimonies of my Muse bid you, when my words have been divided in your heart.

(6) Hear first the four roots of all things: shining Zeus, life-bringing Hera, Aidoneus and Nestis whose tear-drops are a well-spring to mortals.

(7) . . .uncreated.

(8) And I will tell you another thing. There is no substance of any of all the things that die, nor any cessation for them of depraved death. They are only a mingling and interchange of what has been mingled. Substance is but a name given to these things by people.

(9) But they (hold?) that when Light and Air (chance?) to have been mingled in the fashion of a human, or in the fashion of the race of wild beasts or of plants or birds, that that is to be born, and when these things have been separated once more, they call it (wrongly?) woeful death. I follow the custom and call it so myself.

(10) Avenging death.

(11, 12) Fools! for they have no far-reaching thoughts, who deem that what before was not comes into being, or that anything can perish and be utterly destroyed. For it cannot be that anything can arise from what in no way is, and it is impossible and unheard of that what is should perish; for it will always be,

wherever one may keep putting it.

(13) And in the all there is nothing empty and nothing too full.

(14) In the all there is nothing empty. From where, then, could anything come to increase it?

(15) A person who is wise in such matters would never surmise in his heart that as long as mortals have what they call their life, so long they are, and suffer good and bad; while before they were formed and after they have been dissolved they are just nothing at all.

(16) For even as they (Strife and Love) were previously, so too they will be; nor ever, methinks, will boundless time be emptied of that pair.

(17) I will tell you a twofold tale. At one time it grew to be one only out of many; at another, it divided up to be many instead of one. There is a double becoming of perishable things and a double passing away. The coming together of all things brings one generation into being and destroys it; the other grows up and is scattered as things become divided. And these things never cease continually changing places, at one time all uniting in one through Love, at another each carried in different directions by the repulsion of Strife. Thus, as far as it is their nature to grow into one out of many, and to become many once more when the one is parted asunder, so far they come into being and their life abides not. But, inasmuch as they never cease changing their places continually, so far they are ever immovable as they go round the circle of existence.

But come, listen to my words, for it is learning that increases wisdom. As I said before, when I declared the heads of my discussion, I will tell you a twofold tale. At one time it grew together to be one only out of many, at another it parted asunder so as to be many instead of one; Fire and Water and Earth and the mighty height of Air; dread Strife, too, apart from these, of equal weight to each, and Love in their midst, equal in length and breadth. Her do you contemplate with your mind, nor sit with dazed eyes. It is she that is known as being implanted in the frame of mortals. It is she that makes them have thoughts of love and work the works of peace. They call her by the names of joy and Aphrodite. Her has no mortal yet marked moving round among them, but do you attend to the undeceitful ordering of my discussion.

For all these are equal and alike in age, yet each has a different prerogative and its own peculiar nature, but they gain the upper hand in turn when the time comes round. And nothing comes into being besides these, nor do they pass away; for, if they had been passing away continually, they would not be now, and what could increase this all and from where could it come? How, too, could it perish, since no place is empty of these things? There are these alone; but, running through one another, they become now this, now that, and like things always.

(18) Love.

(19) Clinging love. Love.

(20) This (the contest of Love and Strife) is manifest in the mass of mortal limbs. At one time all the limbs that are the body's portion are brought together by Love in blooming life's high Season; at another, severed by cruel Strife, they wander each alone by the breakers of life's sea. It is the same with plants and the fish that make their homes in the waters, with the beasts that have their lairs on the hills and the seabirds that sail on wings.

(21) Come now, look at the things that bear witness to my earlier discussion, if so be that there was any shortcoming as to their form in the earlier list. Observe the sun, everywhere bright and warm, and all the immortal things that are bathed in heat and bright radiance. Observe the rain, everywhere dark and cold; and from the earth issue things close-pressed and solid. When they are in strife all these are different in form and separated; but they come together in love, and are desired by one another.

For out of these have sprung all things that were and are and will be-trees and men and women, beasts and birds and the fishes that live in the waters, yea, and the gods that live long lives and are highest ranking in honor.

For there are these alone; but, running through one another, they take different shapes -- so much does mixture change them.

(22) For all of these -- sun, earth, sky, and sea -- are at one with all their parts that are cast far and wide from them in mortal things. And even so all things that are more adapted for mixture are like to one another and united in love by Aphrodite. Those things, again, that differ most in origin, mixture and the forms imprinted on each, are most hostile, being altogether unaccustomed to unite and very sorry by the bidding of Strife, since it has wrought their birth.

(23) Just as when painters are elaborating temple-offerings, people whom wisdom has well taught their art, -- they, when they have taken pigments of many colors with their hands, mix them in due proportion, more of some and less of others, and from them produce shapes like unto all things, making trees and men and women, beasts and birds and fishes that live in the waters, yea, and gods, that live long lives, and are highest ranking in honor -- so don't let the error prevail over your mind, that there is any other source of all the perishable creatures that appear in countless numbers. Know this for sure, for you have heard the tale from a goddess.

(24) Stepping from summit to summit, not to travel only one path of words to the end. . . .

(25) What is right may well be said even twice.

(26) For they prevail in turn as the circle comes round, and pass into one another, and grow great in their appointed turn.

There are these alone; but, running through one another, they become people and the tribes of beasts. At one time they are all brought together into one order by Love; at another, they are carried each in different directions by the repulsion of Strife, till they grow once more into one and are wholly subdued. Thus in so far as they are wont to grow into one out of many, and again divided become more than one, so far they come into being and their life is not lasting; but in so far as they never cease changing continually, so far are they always, immovable in the circle.

(27) There (in the sphere) are distinguished neither the swift limbs of the sun, no, nor the shaggy earth in its might, nor the sea, -- so fast was the god bound in the close covering of Harmony, spherical and round, rejoicing in his circular solitude.

(27a) There is no discord and no unseemly strife in his limbs.

(28) But he was equal on every side and quite without end, spherical and round, rejoicing in his circular solitude.

(29) Two branches do not spring from his back, he has no feet, no swift knees, no fruitful parts; but he was spherical and equal on every side.

(30, 31) But when Strife was grown great in the limbs of the god and sprang to claim his prerogatives, in the fullness of the alternate time set for them by the mighty oath, . . . for all the limbs of the god in turn quaked.

(32) The joint binds two things.

(33) Even as when fig juice rivets and binds white milk ...

(34) Cementing meal with water ...

(35, 36) But now I will retrace my steps over the paths of song that I have traveled before, drawing from my saying a new saying. When Strife was fallen to the lowest depth of the vortex, and Love had reached to the center of the whirl, in it do all things come together so as to be one only; not all at once, but coming together at their will each from different quarters; and, as they mingled, strife began to pass out to the furthest limit. Yet many things remained unmixed, alternating with the things that were being mixed, namely, all that Strife not fallen yet retained; for it had not yet altogether retired perfectly from them to the outermost boundaries of the circle. Some of it still remained within, and some had passed out from the limbs of the All. But in proportion as it kept rushing out, a soft, immortal stream of blameless Love kept running in, and immediately those things became mortal which had been immortal before, those things were mixed that had before been unmixed, each changing its path. And, as they mingled, countless tribes of mortal creatures were scattered abroad endowed with all manner of forms, a wonder to observe.

(37) Earth increases its own mass, and Air swells the bulk of Air.

(38) Come, I will now tell you first of all the beginning of the sun, and the sources from which have sprung all the things we now observe, the earth and the billowy sea, the damp vapor and the Titan air that binds his circle fast round all things.

(39) If the depths of the earth and the vast air were infinite, a foolish saying which has been vainly dropped from the lips of many mortals, though they have seen but a little of the all ...

(40) The sharp-darting sun and the gentle moon.

(41) But (the sunlight) is gathered together and circles round the mighty heavens.

(42) And she cuts off his rays as he goes above her, and casts a shadow on as much of the earth as is the breadth of the pale-faced moon.

(43) Even so the sunbeam, having struck the broad and mighty circle of the moon, returns at once, running so as to reach the sky.

(44) It flashes back to Olympus with untroubled appearance.

(45, 46) There circles round the earth a round borrowed light, as the nave of the wheel circles round the furthest (goal).

(47) For she gazes at the sacred circle of the lordly sun opposite.

(48) It is the earth that makes night by coming before the lights.

(49) . . .of solitary, blind-eyed night.

(50) And Iris brings wind or mighty rain from the sea.

(51) (Fire) swiftly rushing upwards . . .

(52) And many fires bum beneath the earth.

(53) For so it (the air) chanced to be running at that time, though often otherwise.

(54) But the air sank down upon the earth with its long roots.

(55) Sea the sweat of the earth.

(56) Salt was solidified by the impact of the sun's beams.

(57) On it (the earth) many heads sprung up without necks and arms wandered bare and deprived of shoulders. Eyes strayed up and down in want of foreheads.

(58) Solitary limbs wandered seeking for union.

(59) But, as divinity was mingled still further with divinity, these things joined together as each might chance, and many other things besides them continually arose.

(60) Clumsy creatures with countless hands.

(61) Many creatures with faces and breasts looking in different directions were born; some, offspring of oxen with faces of people, while others, again, arose as offspring of people with the heads of oxen, and creatures in whom the nature of women and men was mingled, furnished with sterile parts.

(62) Come now, hear how the Fire as it was separated caused the night-born shoots of men and tearful women to arise; for my tale is not off the point nor uninformed. Whole-natured forms first arose from the earth, having a portion both of water and fire. These did the fire, desirous of reaching its like, send up, showing as yet neither the charming form of the limbs, nor yet the voice and parts that are proper to men.

(63) . . .But the substance of (the child's) limbs is divided between them, part of it in men's (and part in women's body).

(64) And upon him came desire reminding him through sight.

(65) . . .And it was poured out in the purified parts; and when

it met with cold, women arose from it.

(66) The divided meadows of Aphrodite.

(67) For in its warmer part the womb produces males, and that is why men are dark and more manly and shaggy.

(68) On the tenth day of the eighth month it turns to a white putrefaction."

(69) Double bearing.

(70) Sheepskin.

(71) But if your assurance of these things was in any way deficient as to how, out of Water an(f Earth and Air and Fire mingled together, arose the forms and colors of all those mortal things that have been fitted together by Aphrodite, and so are now come into being...

(72) How tall trees and the fishes in the sea . . .

(73) And even as at that time Kypris, preparing warmth, after she had moistened the Earth in water, gave it to swift fire to harden it...

(74) Leading the songless tribe of fertile fish.

(75) All of those which are dense within and rare without, having received a weakness of this kind at the hands of Kypris . . . .

(76) This you may see in the heavy-backed shellfish that live in the sea, in sea-snails and the stony-skinned turtles. In them you may see that the earthy part lives on the uppermost surface of the skin.

(77-78) It is moisture that makes evergreen trees flourish with abundance of fruit the whole year round.

(79) And so first of all tall olive trees bear eggs . . . .

(80) For this reason pomegranates are late-born and apples succulent.

(81) Wine is the water from the bark, putrefied in the wood.

(82) Hair and leaves, and thick feathers of birds, and the scales that grow on mighty limbs, are the same thing.

(83) But the hair of hedgehogs is sharp-pointed and bristles on their backs.

(84) And even as when a person thinking to travel through a stormy night, gets him ready a lantern, a flame of blazing fire, fastening to it horn plates to keep out all manner of winds, and they scatter the blast of the winds that blow, but the light leaping out through them, shines across the threshold with unfailing beams, as much of it as is finer; even so did she (Love) then entrap the elemental fire, the round pupil, confined within membranes and delicate tissues, which are pierced through and through with wondrous passages. They keep out the deep water that surrounds the pupil, but they let through the fire, as much of it as is finer.

(85) But the gentle flame (of the eye) has but a scanty portion of earth.

(86) Out of these divine Aphrodite fashioned unwearying eyes.

(87) Aphrodite fitting these together with rivets of love.

(88) One vision is produced by both the eyes.

(89) Know that emanations flow from all things that have come into being.

(90) So sweet lays hold of sweet, and bitter rushes to bitter; acid comes to acid, and warm couples with warm.

(91) Water fits better into wine, but it will not (mingle) with oil.

(92) Copper mixed with tin.

(93) The bloom of scarlet dye mingles with the gray linen.

(94) And the black color at the bottom of a river arises from the shadow. The same is seen in hollow caves.

(95) Since they (the eyes) first grew together in the hands of Kypris.

(96) The kindly earth received in its broad funnels two parts of gleaming Nestis out of the eight, and four of Hephaistus. So arose white bones divinely fitted together by the cement of proportion.

(97) The spine (was broken).

(98) And the earth, anchoring in the perfect harbors of Aphrodite, meets with these in nearly equal proportions, with Hephaistus and Water and gleaming Air-either a little more of it, or less of them and more of it. From these did blood arise and the manifold forms of flesh.

(99) The bell... the fleshy sprout (of the ear).

(100) Thus do all things draw breath and breathe it out again. All have bloodless tubes of flesh extended over the surface of their bodies; and at the mouths of these the outermost surface of the skin is perforated all over with pores closely packed together, so as to keep in the blood while a free passage is cut for the. air to pass through. Then, when the thin blood recedes from these, the bubbling air rushes in with an impetuous surge; and when the blood runs back it is breathed out again. Just as when a girl, playing with a water-clock of shining brass, puts the orifice of the pipe upon her comely hand, and dips the water-clock into the yielding mass of silvery water -- the stream does not then flow into the vessel, but the bulk of the air inside, pressing upon the close-packed perforations, keeps it out till she uncovers the compressed stream; but then air escapes and an equal volume of water runs in, -- just in the same way, when water occupies the depths of the brazen vessel and the opening and passage is stopped up by the human hand, the air outside, striving to get in, holds the water back at the gates of the ill-sounding neck, pressing upon its surface, till she lets go with her hand. Then, on the contrary, just in the opposite way to what happened before, the wind rushes in and an equal volume of water runs out to make room. Even so, when the thin blood that surges through the limbs rushes backwards to the interior, immediately the stream of air comes in with a rushing swell; but when the blood runs back the air breathes out again in

equal quantity.

(101) (The dog) with its nostrils tracing out the fragments of the beast's limbs, and the breath from their feet that they leave in the soft grass.

(102) Thus all things have their share of breath and smell.

(103, 104) Thus have all things thought by fortune's will. And inasmuch as the rarest things came together in their fall.

(105) (The heart), dwelling in the sea of blood that runs in opposite directions, where chiefly is what people call thought; for the blood round the heart is the thought of people.

(106) For the wisdom of people grows according to what is before them.

(107) For out of these are all things formed and fitted together, and by these do people think and feel pleasure and pain.

(108) And just so far as they grow to be different, so far do different thoughts ever present themselves to their minds (in dreams).

(109) For it is with earth that we see Earth, and Water with water; by air we see bright Air, by fire destroying Fire. By love do we see Love, and Hate by grievous hate.

(110) For if, supported on your steadfast mind, you wilt contemplate these things with good intent and faultless care, then will you have all these things in abundance throughout your life, and you will gain many others from them. For these things grow of themselves into your heart, where is each person's true nature. But if you strive after things of another kind, as it is the way with people that ten thousand sorry matters blunt their careful thoughts, soon will these things desert you when the time comes round; for they long to return once more to their own kind; for know that all things have wisdom and a share of thought.

And you will learn all the drugs that are a defense against ills and old age; since for you alone will I accomplish all this. You will arrest the violence of the weariless winds that arise to sweep the earth and waste the fields; and again, when you so desire, you will bring back their blasts in return. You will cause for people a seasonable drought after the dark rains, and again you will change the summer drought for streams that feed the trees as they pour down from the sky. You will bring back from Hades the life of a dead person.

Purifications

(112) Friends, that inhabit the great town looking down on the yellow rock of Akragas, up by the citadel, busy in considerable works, harbors of honor for the stranger, people unskilled in meanness, all hail. I go about among you an immortal god, no mortal now, honored among all as is proper, crowned with decorations and flowery garlands. Immediately, whenever I enter with these in my train, both men and women, into the flourishing towns, is reverence done me; they go after me in countless throngs, asking of me what is the way to gain; some desiring oracles, while some, who for many a weary day have been pierced by the grievous pangs of all manner of sickness, beg to hear from me the word of healing.

(113) But why do I harp on these things, as if it were any great matter that I should surpass mortal, perishable humans?

(114) Friends, I know indeed that truth is, in the words I shall utter, but it is hard for people, and jealous are they of the assault of belief on their souls.

(115) There is an oracle of Necessity, an ancient ordinance of the gods, eternal and sealed fast by broad

oaths, that whenever one of the demons, whose portion is length of days, has sinfully polluted his hands with blood, or followed strife and forsworn himself, he must wander thrice ten thousand seasons from the abodes of the blessed, being born throughout the time in all manners of mortal forms, changing one toilsome path of life for another. For the mighty Air drives him into the Sea, and the Sea spews him on the dry Earth; Earth tosses him into the beams of the blazing Sun, and he flings him back to the eddies of Air. One takes him from the other, and all reject him. One of these I now am, an exile and a wanderer from the gods, for that I put my trust in insensate strife.

(116) Charis loathes intolerable Necessity.

(117) For I have been ere now a boy and a girl, a bush and a bird and a dumb fish in the sea.

(118) I wept and I wailed when I saw the unfamiliar land.

(119) From what honor, from what. a height of bliss have I fallen to go about among mortals here on earth.

(120) We have come under this roofed-in cave.

(121) . . . the joyless land, where are Death and Wrath and troops of Dooms besides; and parching plagues and rot and floods roam in darkness over the meadow of Ate.

(122, 123) There were Chthonie and far-sighted Heliope, bloody Discord and gentle-appearanced Harmony, Kallisto and Aischre, Speed and Tarrying, lovely Truth and dark-haired Uncertainty, Birth and Decay, Sleep and waking, Movement and Immobility, crowned Majesty and Meanness, Silence and Voice.

(124) Alas, O wretched race of mortals, sore unblessed: such are the strifes and groanings from which you have been born!

(125) From living creatures he made them dead, changing their forms.

(126) (The goddess) clothing them with a strange garment of flesh.

(127) Among beasts they become lions that make their lair on the hills and their couch on the ground; and laurels among trees with lush foliage.

(128) Nor had they any Ares for a god nor Kydoimos, no nor King Zeus nor Kronus nor Poseidon, but Kypris the Queen. . . . Her did they propitiate with holy gifts, with painted figure and perfumes of cunning fragrance, with offerings of pure myrrh and sweet-smelling frankincense, casting on the ground offerings of brown honey. And the altar did not reek with pure bull's blood, but this was held in the greatest abomination among people, to cat the considerable limbs after tearing out the life.

(129) And there was among them a person of rare knowledge, most skilled in all manner of wise works, a person who had won the utmost wealth of wisdom; for whenever he strained with all his mind, he easily saw everything of all the things that are, in ten, indeed, twenty lifetimes of people.

(130) For all things were tame and gentle to humans, both beasts and birds, and friendly feelings were kindled everywhere.

(131) If ever, as regards the things of a day, immortal Muse, you did deign to take thought for my endeavor, then stand by me once more as I pray to you, O Kalliopeia, as I utter a pure discussion concerning the blessed gods.

(132) Happy is the person who has gained the riches of divine wisdom; wretched he who has a dim opinion of the gods in his heart.

(133) It is not possible for us to set God before our eyes, or to lay hold of him with our hands, which is

the broadest way of persuasion that leads into the heart of people.

(134) For he is not furnished with a human head on his body, two branches do not sprout from his shoulders, he has no feet, no swift knees, nor hairy parts; but he is only a sacred and unutterable mind flashing through the whole world with rapid thoughts.

(135) (This is not lawful for some and unlawful for others;) but the law for all extends everywhere, through the wide-ruling air and the infinite light of heaven.

(136) Will you not cease from this ill-sounding slaughter? See you not that you are devouring one another in the thoughtlessness of your hearts?

(137) And the father lifts up his own son in a changed form and slays him with a prayer. Infatuated fool I And they run up to the sacrificers, begging mercy, while he, deaf to their cries, slaughters them in his halls and gets ready the evil feast. In like manner does the son seize his father, and children their mother, tear out their life and eat the kindred flesh.

(138) Draining their life with bronze.

(139) Ah, woe is me that the pitiless day of death did not destroy me ere ever I wrought evil deeds of devouring with my lips!

(140) Abstain wholly from laurel leaves.

(141) Wretches, utter wretches, keep your hands from beans!

(142) Him will the roofed palace of aigis-bearing Zeus never rejoice, nor yet the house of...

(143) Wash your hands, cutting the water from the five springs in the unyielding bronze

(144) Fast from wickedness!

(145) Therefore are you distraught by grievous wickednesses, and will not unburden your souls of wretched sorrows.

(146, 147) But, at the last, they appear among mortal humans as prophets, song-writers, physicians, and princes; and thence they rise up as gods highest ranking in honor, sharing the hearth of the other gods and the same table, free from human woes, safe from destiny, and incapable of hurt.

(148) . . .Earth that envelops the person.

Back to the top

ANAXAGORAS

Fragments

(1) all things were together, infinite both in number and in smallness; for the small too was infinite. And, when all things were together, none of them could be distinguished for their smallness. For air and aether prevailed over all things, being both of them infinite; for among all things these are the greatest both in quantity and size.

(2) For air and aether are separated off from the mass that surrounds the world, and the surrounding mass is infinite in quantity.

(3) Nor is there a least of what is small, but there is always a smaller; for it cannot be that what is should

cease to be by being cut. But there is also always something, greater than what is great, and it is equal to the small in amount, and, compared with itself, each thing is both great and small.

(4) And since these things are so, we must suppose that there are contained many things and of all sorts in the things that are uniting, seeds of all things, with all sorts of shapes and colors and tastes, and that people have been formed in them, and the other animals that have life, and that these people have inhabited cities and cultivated fields as with us; and that they have a sun and a moon and the rest as with us; and that their earth produces for them many things of all kinds of which they gather the best together into their dwellings, and use them. Thus much have I said with regard to separating off, to show that it will not be only with us that things are separated off, but elsewhere too.

But before, they were separated off, when all things were together, not even was any color distinguishable. For the mixture of all things prevented it -- of the moist and the dry, and the warm and the cold, and the light and the dark, and of much earth that was in it, and of a multitude of innumerable seeds in no way like each other. For none of the other things either is like any other. And these things being so, we must hold that all things are in the whole.

(5) And those things having been thus decided, we must know that all of them are neither more nor less; for it is not possible for them to be more than all, and all are always equal.

(6) And since the portions of the great and of the small are equal in amount, for this reason, too, all things will be in everything; nor is it possible for them to be apart, but all things have a portion of everything. Since it is impossible for there to be a least thing, they cannot be separated, nor come to be by themselves; but they must be now, just as they were in the beginning, all together. And in all things many things are contained, and an equal number both in the greater and in the smaller of the things that are separated off.

(7) . . . So that we cannot know the number of the things that are separated off, either in word or deed.

(8) The things that are in one world are not divided nor cut off from one another with a hatchet, neither the warm from the cold nor the cold from the warm.

(9) . . . as these things revolve and are separated off by the force and swiftness. And the swiftness makes the force. Their swiftness is not like the swiftness of any of the things that are now among people, but in every way many times as swift.

(10) How can hair come from what is not hair, or flesh from what is not flesh?

(11) In everything there is a portion of everything except Nous, and there are some things in which there is Nous also.

(12) All other things partake in a portion of everything, while Nous is infinite and self-ruled, and is mixed with nothing, but is alone, itself by itself. For if it were not by itself, but were mixed with anything else, it would partake in all things if it were mixed with any; for in everything there is a portion of everything, as has been said by me in what goes before, and the things mixed with it would hinder it, so that it would have power over nothing in the same way that it has now being alone by itself. For it is the thinnest of all things and the purest, and it has all knowledge about everything and the greatest strength; and Nous has power over all things, both greater and smaller, that have life. And Nous had power over the whole revolution, so that it began to revolve in the beginning. And it began to revolve first from a small beginning; but the revolution now extends over a larger space, and will extend over a larger still. And all the things that are mingled together and separated off and distinguished are all known by Nous. And Nous set in order all things that were to be, and all things that were and are not now and that are, and this revolution in which now revolve the stars and the sun and the moon, and the air and the aether

that are separated off. And this revolution caused the separating off, and the rare is separated off from the dense, the warm from the cold, the light from the dark, and the dry from the moist. And there are many portions in many things. But no thing is altogether separated off nor distinguished from anything else except Nous. And all Nous is alike, both the greater and the smaller; while nothing else is like anything else, but each single thing is and was most manifestly those things of which it has most in it.

(13) And when Nous began to move things, separating off took place from all that was moved, and so much as Nous set in motion was all separated. And as things were set in motion and separated, the revolution caused them to be separated much more.

(14) And Nous, which ever is, is certainly there, where everything else is, in the surrounding mass, and in what has been united with it and separated off from it.

(15) The dense and the moist and the cold and the dark came together where the earth is now, while the rare and the warm and the dry (and the bright) went out towards the further part of the aether.

(16) From these as they are separated off earth is solidified for from mists water is separated off, and from water earth. From the earth stones are solidified by the cold, and these rush outwards more than water.

(17) The Hellenes follow a wrong usage in speaking of coming into being and passing away; for nothing comes into being or passes away, but there is mingling and separation of things that are. So they would be right to call coming into being mixture, and passing away separation.

(18) It is the sun that puts brightness into the moon.

(19) We call rainbow the reflection of the sun in the clouds. Now it is a sign of storm; for the water that flows round the cloud causes wind or pours down in rain.

(20) With the rise of the Dogstar (?) people begin the harvest with its setting they begin to till the fields. It is hidden for forty days and nights.

(21) From the weakness of our senses we are not able to judge the truth.

(21a) What appears is a vision of the unseen.

(21b) (We can make use of the lower animals) because we use our own experience and memory and wisdom and art.

(22) What is called "birds' milk" is the white of the egg.

Testimonial (Theophrastus)

But Anaxagoras says that perception is produced by opposites; for like things cannot be effected by like. He attempts to give, a detailed enumeration of the particular senses. We see by means of the image in the pupil; but no image is cast upon what is of the same color, but only on what is different. With most living creatures things are of a different color to the pupil by day, though with some this is so by night, and these are accordingly keen-sighted at that time. Speaking generally, however, night is more of the same color with the eyes than day. And an image is cast on the pupil by day, because light is a concomitant cause of the image, and because the prevailing color casts an image more readily upon its opposite.

It is in the same way that touch and taste discern their objects. That which is just as warm or just as cold as we are neither warms us nor cools us by its contact; and, in the same way, we do not apprehend the sweet and the sour by means of themselves. We know cold by warm, fresh by salt, and sweet by sour, in virtue of our deficiency in each; for all these are in us to begin with. And we smell and hear in the same manner; the former by means of the accompanying respiration, the latter by the sound penetrating to the

brain, for the bone which surrounds this is hollow, and it is upon it that the sound falls.

And an sensation implies pain, a view which would seem to be the consequence of the first assumption, for all unlike things produce pain by their contact. And this pain is made perceptible by the long continuance or by the excess of a sensation. Brilliant colors and excessive noises produce pain, and we cannot live long on the same things. The larger animals are the more sensitive, and, generally, sensation is proportionate to the size of the organs of sense. Those animals which have large, pure, and bright eyes, see large objects and from a great distance, and contrariwise.

And it is the same with hearing. Large animals can hear great and distant sounds, while less sounds pass unperceived; small animals perceive small sounds and those near at hand. It is the same too with smell. Rarefied air has more smell; for, when air is heated and rarefied, it smells. A large animal when it breathes draws in the condensed air along with the rarefied, while a small one draws in the rarefied by itself; so the large one perceives more. For smell is better perceived when it is near than when it is far by reason of its being more condensed, while when dispersed it is weak. But, roughly speaking, large animals do not perceive a rarefied smell, nor small animals a condensed one.

ZENO

Fragments

(1) If what is had no magnitude, it would not even be... But, if it is, each one must have a certain magnitude and a certain thickness, and must be at a certain distance from another, and the same may be said of what is in front of it; for it, too, will have magnitude, and something will be in front of it. It is all the same to say this once and to say it always; for no such part of it will be the last, nor will one thing not be as compared with another. So if things are a many, they must be both small and great, so small as not to have any magnitude at all, and so great as to be infinite.

(2) For if it were added to any other thing it would not make it any larger; for nothing can gain in magnitude by the addition of what has no magnitude, and thus it follows at once that what was added was nothing. But if, when this is taken away from another thing, that thing is no less; and again, if, when it is added to another thing, that does not increase, it is plain that what was added was nothing, and what was taken away was nothing.

(3) If things are a many, they must be just as many as they are, and neither more nor less. Now, if they are as many as they are, they will be finite in number.

If things are a many, they will be infinite in number;, for there will always be other things between them, and others again between these. And so things are infinite in number.

Testimonial (paraphrased from Aristotle)

(1) You cannot cross a race-course. You cannot traverse an infinite number of points in a finite time. You must traverse the half of any given distance before you traverse the whole, and the half of that again before you can traverse it. This goes on ad infinitum, so that there are an infinite number of points in any given space, and you cannot touch an infinite number one by one in a finite time.

(2) Achilles will never overtake the tortoise. He must first reach the place from which the tortoise started.

By that time the tortoise will have got some way ahead. Achilles must then make up that, and again the tortoise will be ahead. He is always coming nearer, but he never makes up to it.

(3) The arrow in flight is at rest. For, if everything is at rest when it occupies a space equal to itself, and what is in flight at any given moment always occupies a space equal to itself, it cannot move.

Back to the top

MELISSOS

Fragments

(1a) If nothing is, what can be said of it as of something real?

(1) What was was ever, and ever will be. For, if it had come into being, it needs must have been nothing before it came into being. Now, if it were nothing, in no wise could anything have arisen out of nothing.

(2) Since, then, it has not come into being, and since it is, was ever, and ever shall be, it has no beginning or end, but is without limit. For, if it had come into being, it would have had a beginning (for it would have begun to come into being at some time or other) and an end (for it would have ceased to come into being at some time or other); but, if it neither began nor ended, and ever was and ever will be, it has no beginning or end; for it is not possible for anything to be ever without all being.

(3) Further, just as it ever is, so it must ever be infinite in magnitude.

(4) But nothing which has a beginning or end is either eternal or infinite.

(5) If it were not one, it would be bounded by something else.

(6) For if it is (infinite), it must be one; for if it were two, it could not be infinite; for then they would be bounded by one another.

(6a) (And, since it is one, it is alike throughout; for if it were unlike, it would be many and not one.)

(7) So then it is eternal and infinite and one and all alike. And it cannot perish nor become greater, nor does it suffer pain or grief. For, if any of these things happened to it, it would no longer be one. For if it is altered, then the real must needs not be all alike, but what was before must pass away, and what was not must come into being. Now, if it changed by so much as a single hair in ten thousand years, it would all perish in the whole of time.

Further, it is not possible either that its order should be changed; for the order which it had before does not perish, nor does that which was not come into being. But, since nothing is either added to it or passes away or is altered, how can any real thing have had its order changed? For if anything became different, that would amount to a change in its order.

Nor does it suffer pain; for a thing in pain could not all be. For a thing in pain could not be ever, nor has it the same power as what is whole. Nor would it be alike, if it were in pain; for it is only from the addition or subtraction of something that it could feel pain, and then it would no longer be alike. Nor could what is whole feel pain; for then what was whole and what was real would pass away, and what was not would, come into being. And the same argument applies to grief as to pain.

Nor is anything empty. For what is empty is nothing. What is nothing cannot be.

Nor does it move; for it has nowhere bring itself to, but is full. For if there were anything empty, it would

bring itself to the empty. But, since there is nothing empty, it has nowhere to bring itself to.

And it cannot be dense and rare; for it is not possible for what is rare to be as full as what is dense, but what is rare is at once emptier than what is dense.

This is the way in which we must distinguish between what is full and what is not full. If a thing has room for anything else, and takes it in, it is not full; but if it has no room for anything and does not take it in, it is full.

Now, it must needs be full if there is nothing empty, and if it is full, it-does not move.

(8) This argument, then, is the greatest proof that it is one alone; but the following are proofs of it also. If there were a many, these would have to be of the same kind as I say that the one is. For if there is earth and water, and air and iron, and gold and fire, and if one thing is living and another dead, and if things are black and white and all that people say they really are,-if that is so, and if we see and hear aright, each one of these must be such as we first decided, and they cannot be changed or altered, but each must be just as it is. But, as it is, we say that we see and hear and understand aright, and yet we believe that what is warm becomes cold, and what is cold warm; that what is hard turns soft, and what is soft hard; that what is living dies, and that things are born from what lives not; and that all those things are changed, and that what they were and what they are now are in no way alike. We think that iron, which is hard, is rubbed away by contact with the finger; and so with gold and stone and everything which we fancy to be strong, and that earth and stone are made out of water; so that it turns out that we neither see nor know realities. Now these things do not agree with one another. We said that there were many things that were eternal and had forms and strength of their own, and yet we fancy that they all suffer alteration, and that they change from what we see each time. It is clear, then, that we did not see aright after all, nor are we right in believing that all these things are many. They would not change if they were real, but each thing would be just what we believed it to be; for nothing is stronger than true reality. But if it has changed, what was has passed away, and what was not is come into being. So then, if there were many things, they would have to be just of the same nature as the one.

(9) Now, if it were to exist, it must needs be one; but if it is one, it cannot have body; for, if it had body it would have parts, and would no longer be one.

(10) If what is real is divided, it moves; but if it moves, it cannot be.

Back to the top

DIOGENES OF APOLLONIA

Fragments

(1) In the beginning any discussion, it seems to me that one should make one's starting-point something indisputable, and one's expression simple and dignified.

(2) My view is, to sum it all up, that all things are differentiations of the same thing, and are the same thing. And this is obvious; for, if the things which are now in this world-earth, and water, and air and fire, and the other things which we see existing in this world-if any one of these things, I say, were different from any other, different, that is, by having a substance peculiar to itself; and if it were not the same thing that is often changed and differentiated ' then things could not in any way mix with one

another, nor could- they do one another good or harm. Neither could a plant grow out of the earth, nor any animal nor anything else come into being unless things were composed in such a way as to be the same. But all these things arise from the same thing; they are differentiated and take different forms at different times, and return again to the same thing.

(3) For it would not be possible for it without intelligence to be so divided, as to keep the measures of all things, of winter and summer, of day and night, of rains and winds and fair weather. And any one who cares to reflect will find that everything else is disposed in the best possible manner. R. P. 210.

(4) And, further, there are still the following great proofs. Humans and all other animals live upon air by breathing it, and this is their soul and their intelligence, as will be clearly shown in this work; while, when this is taken away, they die, and their intelligence fails.

(5) And my view is, that that which has intelligence is what people call air, and that all things have their course steered by it, and that it has power over all things. For this very thing I hold to be a god," and to reach everywhere, and to dispose everything, and to be in everything; and there is not anything which does not partake in it. Yet no single thing partakes in it just in the same way as another; but there are many modes both of air and of intelligence. For it undergoes many transformations, warmer and colder, drier and moister, more stable and in swifter motion, and it has many other differentiations in it, and an infinite number of colors and tastes. And the soul of all living things is the same, namely, air warmer than that outside us and in which we are, but much colder than that near the sun. And this warmth is not alike in any two kinds of living creatures, nor, for the matter of that, in any two people; but it does not differ much, only so far as is compatible with their being alike. At the same time, it is not possible for any of the things which are differentiated to be exactly like one another till they all once more become the same.

(6) Since, then, differentiation is multiform, living creatures are multiform and many, and they are like one another neither in appearance nor in intelligence, because of the multitude of differentiations. At the same time, they all live, and see, and hear by the same thing, and they all have their intelligence from the same source.

(7) And this itself is an eternal and undying body, but of those things I some come into being and some pass away.

(8) But this, too, appears to me to be obvious, that it is both great, and mighty, and eternal, and undying, and of great knowledge.

ARCHELAUS

Testimonial by Hippolitus

Archelaus was by birth an Athenian, and the son of Apollodorus. He spoke of the mixture of matter in a similar way to Anaxagoras, and of the first principles likewise. He held, however, that there was a certain mixture immanent even in Nous. And he held that there were two efficient causes which were separated off from one another, namely, the warm and the cold. The former was in motion, the latter at rest. When the water was liquefied it flowed to the center, and there being burnt up it turned to earth and air, the latter of which was carried upwards, while the former took up its position below. These, then, are the reasons why the earth is at rest, and why it came into being. It lies in the center, being practically no

appreciable part of the universe. (But the air rules over all things), being produced by the burning of the fire, and from its original combustion comes the substance of the heavenly bodies. Of these the sun is the largest, and the moon second; the rest are of various sizes. He says that the heavens were inclined, and that then the sun made fight upon the earth, made the air transparent, and the earth dry; for it was originally a pond, being high at the circumference and hollow in the center. He adduces as a proof of this hollowness that the sun does not rise and set at the same time for all peoples, as it ought to do if the earth were level. As to animals, he says that when the earth was first being warm in the lower part where the warm and the cold were mingled together, many living creatures appeared, and especially people, all having the same manner of life, and deriving their sustenance from the slime; they did not live long, and later on generation from one another began. And people were distinguished from the rest, and set up leaders, and laws, and arts, and cities, and so forth. And he says that Nous is implanted in all animals alike; for each of the animals, as well as humans, makes use of Nous, but some quicker and some slower.

* * * *

ANAXIMANDER

Testimonials

(1) Anaximander of Miletus, son of Praxiades, a fellow-citizen and associate of Thales, said that the material cause and first element of things was the Infinite, he being the first to introduce this name of the material cause. He says it is neither water nor any other of the so-called elements, but a substance different from them which is infinite, from which arise all the heavens and the worlds within them. (Theophrastus, <Phys>. <Op>. fr. 2)

(2) He says that this is " eternal and ageless," and that it " encompasses all the worlds." (Hippolytus <Ref>. i. 6)

(3) And into that from which things take their rise they pass away once more, " as is proper; for they make reparation and satisfaction to one another for their injustice according to the ordering of time," as he says in these somewhat poetical terms. (Theophrastus <Phys>. <Op>. fr. 2)

(4) And besides this, there was an eternal motion, in which was brought about the origin of the worlds. (Hippolytus <Ref>. i. 6)

(5) He did not ascribe the origin of things to any alteration in matter, but said that the oppositions in the substratum, which was a boundless body, were separated out. (Simplicius <Phys>. P. 3150, 20)

(6) Further, there cannot be a single, simple body which is infinite, either, as some hold, one distinct from the elements, which they then derive from it, or without this qualification. For there are some who make this (i.e. a body distinct from the elements) the infinite, and not air or water,- in order that the other things may not be destroyed by their infinity. They are in opposition one to another-air is cold, water moist, and fire hot-and therefore, if any one of them were infinite, the rest would have ceased to be by this time. Accordingly they say that what is infinite is something other than the elements, and from it the elements arise. (Aristotle, <Phys>. 204b 22)

* * * *

ANAXIMENES

Testimonials

(1) Anaximenes of Miletus, son of Eurystratos, who had been an associate of Anaximander, said, like him, that the underlying substance was one and infinite. He did not, however, say it was indeterminate, like Anaximander, but determinate; for he said it was Air. (Theophrastus, <Phys>. <Op>. fr. 2)

(2) From it, he said, the things that are, and have been, and will be, the gods and things divine, took their rise, while other things come from its offspring. (Hippolytus <Ref>. i. 7)

(3) "Just as," he said, "our soul, being air, holds us together, so do breath and air encompass the whole world." (Aet. i. 3, 4)

(4) And the form of the air is as follows. Where it is most even, it is invisible to our sight; but cold and heat, moisture and motion, make it visible. It is always in motion; for, if it were not, it would not change so much as it does. (Hippolytus <Ref>. i. 7)

(5) It differs in different substances in virtue of its rarefaction and condensation. (Theophrastus, <Phys>. <Op>. fr. 2)

(6) When it is dilated so as to be rarer, it becomes fire; while winds, on the other hand, are condensed Air. Cloud is formed from Air by felting; and this, still further condensed, becomes water. Water, condensed still more, turns to earth; and when condensed as much as it can be, to stones. (Hippolytus <Ref>. i. 7)

* * * *

XENOPHANES

Fragments (Elegies)

(1) Now is the floor clean, and the hands and cups of all; one sets twisted garlands on our heads, another hands us fragrant ointment on a salver. The mixing bowl stands ready, full of gladness, and there is more wine at hand that promises never to leave us in the lurch, soft and smelling of flowers in the jars. In the midst the frankincense sends up its holy scent, and there is cold water, sweet and clean. Brown loaves are set before us and a lordly table laden with cheese and rich honey. The altar in the midst is clustered round with flowers; song and festivity fill the halls.

But first it is proper that people should sing to the god with joy, with holy tales and pure words; then after offerings and prayer made that we may have strength to do right -- for that is in truth the first thing to do -- no sin is it to drink as much as a person can take and get home without an attendant, so he be not stricken in years. And of all people is he to be praised who after drinking gives considerable proof of himself in the trial of skill, as memory and strength will serve him. Let him not sing of Titans and Giants -- those fictions of the people of old -- nor of turbulent civil battles in which is no good thing at all; but to give heedful reverence to the gods is always good.

(2) What if a person wins victory in swiftness of foot, or in the pentathlon, at Olympia, where is the region of Zeus by Pisa's springs, or in wrestling -- what if by cruel boxing or that fearful sport people call pankration he become more glorious in the citizens' eyes, and win a place of honor in the sight of all at the games, his food-at the public cost from the state, and a gift to be an heirloom for him-what if he conquer in the chariot-race -- he win not deserve all this for his portion so much as I do. Far better is our art than the strength of men and of horses! These are but thoughtless judgments, nor is it fitting to set strength before considerable art. Even if there arise a mighty boxer among a people, or one great in the pentathlon or at wrestling, or one excelling in swiftness of foot -- and that stands in honor before all tasks of people at the games -- the city would be none the better governed for that. It is but little joy a city gets of it if a person conquer at the games by Pisa's banks; it is not this that makes fat the store-houses of a city.

(3) They learnt dainty and unprofitable ways from the Lydians, so long as they were free from hateful tyranny; they went to the market-place with cloaks of purple dye, not less than a thousand of them all told, conceited and proud of their shapely locks of hair, fragrant from salves.

(4) Nor would a person mix wine in a cup by pouring out the wine first, but water first and wine on the top of it.

(5) You did send the thigh-bone of a kid and get for it the fat leg of a fatted bull, a worthy compensation for a person to get, whose glory is to reach every part of Hellas and never to pass away, so long as Greek songs last.

(7) And now I will turn to another tale and point the way. . . . Once they say that he (Pythagoras) was passing by when a dog was being beaten and spoke this word: "Stop! Don't beat it! For it is the soul of a friend that I recognized when I heard its voice."

(8) There are by this time threescore years and seven that have tossed my careworn soul up and down the land of Hellas; and there were then five-and-twenty years from my birth, if I can say anything truly about these matters.

(9) Much weaker than an aged person.

Fragments (Satires)

(10) Since all at first have learnt according to Homer. . . .

(11) Homer and Hesiod have ascribed to the gods all things that are a shame and a disgrace among mortals, stealings and adulteries and deceivings of one another.

(12) Since they have uttered many lawless deeds of the gods, stealings and adulteries and deceivings of one another.

(14) But mortals deem that the gods are begotten as they are, and have clothes like theirs, and voice and form.

(15) Yes, and if oxen and horses or lions had hands, and could paint with their hands, and produce works of art as people do, horses would paint the forms of the gods like horses, and oxen like oxen, and make their bodies in the image of their several kinds.

(16) The Ethiopians make their gods black and snub-nosed; the Thracians say theirs have blue eyes and red hair.

(18) The gods have not revealed all things to people from the beginning, but by seeking they find in time what is better.

(23) One god, the greatest among gods and humans, neither in form like unto mortals nor in thought. . . .

(24) He sees all over, thinks all over, and hears all over.

(25) But without toil he sways all things by the thought of his mind.

(26) And he abides ever in the selfsame place, moving not at all; nor does it befit him to go about now here, now there.

(27) all things come from the earth, and in earth all things end.

(28) This limit of the earth above is seen at our feet in contact with the air; below it reaches down without a

limit.

(29) All things are earth and water that come into being and grow.

(30) The sea is the source of water and the source of wind; for neither in the clouds (would there be any blasts of wind blowing) from within without the mighty sea, nor rivers' streams nor rain-water from the sky. The mighty sea is father of clouds and of winds and of rivers.

(31) The sun swinging over the earth and warming it. . . .

(32) She that they call Iris is a cloud likewise, purple, scarlet and green to observe.

(33) For we all are born of earth and water.

(34) There never was nor will be a person who has certain knowledge about the gods and about all the things I speak of. Even if he should chance to say the complete truth, yet he himself knows not that it is so. But all may have their fancy.

(35) Let these be taken as fancies something like the truth.

(36) all of them that are visible for mortals to observe.

(37) And in some caves water drips. . . .

(38) If god had not made brown honey, people would think that figs are far sweeter than they do think of about them.

* * * *

HERACLITUS

Fragments

(1) It is wise to listen, not to me, but to my Word, and to confess that all things are one.

(2) Though this word is true always, yet people are as unable to understand it when they hear it for the first time as before they have heard it at all. For, though all things come to pass in accordance with this Word, people seem as if they had no experience of them, when they make trial of words and deeds such as I establish, dividing each thing according to its kind and showing how it truly is. But other people know not what they are doing when awake, even as they forget what they do in sleep.

(3) Fools when they do hear are like the deaf: of them does the saying bear witness that they are absent when present.

(4) Eyes and ears are bad witnesses to people if they

have souls that understand not their language.

(5) The many do not take heed of such things as they meet with, nor do they mark them when they are taught, though they think they do.

(6) Knowing not how to listen nor how to speak.

(7) If you do not expect the unexpected, you will not find it for it is hard to be sought out and difficult.

(8) Those who seek for gold dig up much earth and find a little.

(10) Nature loves to hide.

(11) The lord whose is the oracle at Delphi neither utters nor hides his meaning, but shows it by a sign.

(12) And the Sibyl, with raving lips uttering things mirthless, unadorned, and unperfumed, reaches over a thousand years with her voice, thanks to the god in her.

(13) The things that can be seen, heard, and learned are what I prize the most.

(14) . . . bringing untrustworthy witnesses in support of disputed points.

(15) The eyes are more exact witnesses than the ears.

(16) The learning of many things teaches not understanding, else would it have taught Hesiod and Pythagoras, and again Xenophanes and Hekataius.

(17) Pythagoras, son of Mnesarchus, practiced scientific inquiry beyond all other people, and malting a selection of these writings, claimed for his own wisdom what was but a knowledge of many things and an imposture.

(18) Of all whose discussions I have heard, there is not one who attains to understanding that wisdom is apart from all.

(19) Wisdom is one thing. It is to know the thought by which all things are steered through all things.

(20) This world, which is the same for all, no one of gods or humans has made; but it was ever, is now, and ever will be an ever-living Fire, with measures of it kindling, and measures going out.

(21) The transformations of Fire are, first of all, sea; and half of the sea is earth, half whirlwind.

(22) all things are an exchange for Fire, and Fire for all things, even as wares for gold and gold for wares.

(23) It becomes liquid sea, and is measured by the same tale as before it became earth.

(24) Fire is want and excess.

(25) Fire lives the death of air, and air lives the death of fire; water lives the death of earth, earth that of water.

(26) Fire in its advance will judge and convict all things.

(27) How can one hide from that which never sets?

(28) It is the thunderbolt that steers the course of all things.

(29) The sun will not overstep his measures; if he does, the Erinyes, the handmaids of justice, will find him out.

(30) The limit of dawn and evening is the Bear; and opposite the Bear is the boundary of bright Zeus.

(31) If there were no sun it would be night, for all the other stars could do.

(32) The sun is new every day.

(33) Thales foretold an eclipse.

(34) . . . the seasons that bring all things.

(35) Hesiod is most people's teacher. People are sure he knew very many things, a man who did not know day or night! They are one.

(36) God is day and night, winter and summer, war and peace, surfeit and hunger; but he takes various shapes, just as fire, when it is mingled with spices, is named according to the taste of each.

(37) If all things were turned to smoke, the nostrils would distinguish them.

(38) Souls smell in Hades.

(39) Cold things become warm, and what is warm cools; what is wet dries, and the parched is moistened.

(40) It scatters and it gathers; it advances and retires. (41, 42) You cannot step twice into the same rivers; for fresh waters are ever flowing in upon you.

(43) Homer was wrong in saying: "Would that strife might perish from among gods and humans!" He did not see that he was praying for the destruction of the universe; for, if his prayer were heard, all things would pass away. . . .

(44) War is the father of all and the king of all; and some he has made gods and some humans, some bond and some free.

(45) People do not know how what is at variance agrees with itself. It is an attunement of opposite tensions, like that of the bow and the lyre.

(46) It is the opposite which is good for us.

(47) The hidden attunement is better than the open.

(48) Let us not conjecture at random about the greatest things.

(49) People that love wisdom must be acquainted with very many things indeed.

(50) The straight and the crooked path of the fuller's comb is one and the same.

(51) Asses would rather have straw than gold.

(51a) Oxen are happy when they find bitter vetches to eat.

(52) The sea is the purest and the impurest water. Fish can drink it, and it is good for them; to people it is undrinkable and destructive.

(53) Swine wash in the mire, and barnyard fowls in dust.

(54) . . . to delight in the mire.

(55) Every beast is driven to pasture with blows.

(56) [Same as 45.]

(57) Good and ill are one.

(58) Physicians who cut, bum, stab, and rack the sick, demand a fee for it which they do not deserve to get.

(59) Couples are things whole and things not whole, what is drawn together and what is drawn asunder, the harmonious and the discordant. The one is made up of all things, and all things issue from the one.

(60) People would not have known the name of justice if these things were not.

(61) To God all things are fair and good and right, but people hold some things wrong and some right.

(62) We must know that war is common to all and strife is justice, and that all things come into being and pass away (?) through strife.

(64) all the things we see when awake are death, even as all we see in slumber are sleep.

(65) The wise is one only. It is unwilling and willing to be called by the name of Zeus.

(66) The bow is called life, but its work is death.

(67) Mortals are immortals and immortals are mortals, the one. Living the others' death and dying the others' life.

(68) For it is death to souls to become water, and death to water to become earth. But water comes from earth; and from water, soul.

(69) The way up and the way down is one and the same.

(70) In the circumference of a circle the beginning and end are common.

(71) You will not find the boundaries of soul by traveling in any direction, so deep is the measure of it."

(72) It is pleasure to souls to become moist.

(73) A person, when he gets drunk, is led by a beardless lad, tripping, knowing not where he steps, having his soul moist.

(74-76) The dry soul is the wisest and best.

(77) People set a light for themselves in the night-time, when they have died but are alive. The sleeper, whose vision has been put out, lights up from the dead; he that is awake lights up from the sleeping.

(78) And it is the same thing in us that is quick and dead, awake and asleep, young and old; the former are shifted and become the latter, and the latter in turn are shifted and become the former.

(79) Time is a child playing checkers, the kingly power is a child's.

(80) I have sought for myself.

(81) We step and do not step into the same rivers; we are and are not.

(82) It is a weariness to labor for the same masters and be ruled by them.

(83) It rests by changing.

(84) Even the posset separates if it is not stirred.

(85) Corpses are more fit to be cast out than dung.

(86) When they are born, they wish to live and to meet with their dooms -- or rather to rest -- and they leave children behind them to meet with their dooms in turn.

(87-89) A man may be a grandfather in thirty years.

(90) Those who are asleep are fellow-workers (in what goes on in the world).

(91a) Thought is common to all.

(91b) Those who speak with understanding must hold fast to what is common to all as a city holds fast to its law, and even more strongly. For all human laws are fed by the one divine law. It prevails as much as it will, and suffices for all things with something to spare.

(92) So we must follow the common, yet though my Word is common, the many live as if they had a wisdom of their own.

(93) They are estranged from that with which they have most constant intercourse.

(94) It is not proper to act and speak like people asleep.

(95) The waking have one common world, but the sleeping turn aside each into a world of his own.

(96) The way of humans has no wisdom, but that of God has.

(97) People are called babies by God, even as a child by a person.

(98, 99) The wisest person is an ape compared to God, just as the most beautiful ape is ugly compared to humans.

(100) The people must fight for its law as for its walls.

(101) Greater deaths win greater portions.

(102) Gods and humans honor those who are slain in battle.

(103) Wantonness needs putting out, even more than a house on fire.

(104) It is not good for people to get all they wish to get. It is sickness that makes health pleasant; evil, good; hunger, plenty; weariness, rest.

(105-107) It is hard to fight with one's heart's desire. Whatever it wishes to get, it purchases at the cost of soul.

(108, 109) It is best to hide folly; but it is hard in times of relaxation, over our cups.

(110) And it is law, too, to obey the counsel of one.

(111) For what thought or wisdom have they? They follow the poets and take the crowd as their teacher, knowing not that there are many bad and few good. For even the best of them choose one thing above all others, immortal glory among mortals, while most of them are glutted like beasts.

(112) In Priene lived Bias, son of Teutamas, who is of more account than the rest. (He said, "Most people are bad.")

(113) One is ten thousand to me, if he be the best.

(114) The Ephesians would do well to hang themselves, every grown person of them, and leave the city to beardless lads; for they have cast out Hermodorus, the best person among them, saying, "We will have none who is best among us; if there be any such, let him be so elsewhere and among others."

(115) Dogs bark at every one they do not know.

(116) . . . (The wise person) is not known because of people's want of belief.

(117) The fool is fluttered at every word.

(118) The most esteemed of them knows but fancies, and holds fast to them, yet of a truth justice will overtake the artificers of lies and the false witnesses.

(119) Homer should be turned out of the lists and whipped, and Archilochus likewise.

(120) One day is like any other.

(121) A person's character is his fate.

(122) There awaits people when they die such things as they look not for nor dream of.

(123) . . . that they rise up and become the wakeful guardians of the quick and dead.

(124) Night-walkers, Magians, Bakchoi, Lenai, and the initiated . . .

(125) The mysteries practiced among people are unholy mysteries.

(126) And they pray to these images, as if one were to talk with a person's house, knowing not what gods or heroes are.

(127) For if it were not to Dionysus that they made a procession and sang the shameful phallic hymn, they would be acting most shamelessly. But Hades is the same as Dionysus in whose honor they go mad and rave.

(129, 130) They vainly purify themselves by defiling themselves with blood, just as if one who had stepped into the mud were to wash his feet in mud. Any person who marked him doing thus, would deem him mad.

* * * *

PARMENIDES

Fragments from <On Nature>

(1) The car that bears me carried me as far as ever my heart desired, when it had brought me and set me on the renowned way of the goddess, which leads the man who knows through all the towns. On that way was I carried along; for on it the wise steeds carried me, drawing my car, and maidens showed the way. And the axle, glowing in the socket -- for it was urged round by the whirling wheels at each end -- gave a sound like a pipe, when the daughters of the Sun, to convey me into the light, threw back their veils from off their faces and left the abode of Night.

There are the gates of the ways of Night and Day, fitted above with a lintel and below with a threshold of stone. They themselves, high in the air, are closed by mighty doors, and Avenging justice keeps the keys that fit them. Her did the maidens entreat with gentle words and cunningly persuade to unfasten without demur the bolted bars from the gates. Then, when the doors were thrown back, they disclosed a wide opening, when their brazen posts fitted with rivets and nails swung back one after the other. Straight through them, on the broad way, did the maidens guide the horses and the car, and the goddess greeted me kindly, and took my right hand in hers, and spoke to me these words:

Welcome, O youth, that come to my abode on the car that bears you tended by immortal charioteers! It is no ill chance, but right and justice that has sent you to travel on this way. Far, indeed, does it lie from the beaten track of people! It is proper for you to learn all things, as well the unshaken heart of well-rounded truth, as the opinions of mortals in which is no true belief at all. Yet none the less will you learn these things also, -- how passing right through all things one should judge the things that seem to be.

But do you restrain your thought from this way of inquiry, nor let habit by its much experience force you to cast upon this way a wandering eye or sounding ear or tongue; but judge by argument the much disputed proof uttered by me. There is only one way left that can be spoken of ...

<The Way of Truth>

(2) Look steadfastly with your mind at things though afar as if they were at hand. You can not cut off what is from holding fast to what is, neither scattering itself abroad in order nor coming together.

(3) It is all one to me where I begin; for I will come back again there.

(4, 5) Come now, I will tell you -- and do you listen to my saying and carry it away -- the only two ways of search that can be thought of. The first, namely, that <it is>, and that it is impossible for it not to be, is the way of belief, for truth is its companion. The other, namely, that <it is not>, and that it must needs not be,-that, I

tell you, is a path that none can learn of at all. For you can not know what is not-that is impossible-nor utter it; for it is the same thing that can be thought and that can be.

(6) It must be that what can be spoken and thought is; for it is possible for it to be, and it is not possible for what is nothing to be. This is what I bid you ponder. I hold you back from this first way of inquiry, and from this other also, upon which mortals knowing nothing wander two-faced; for helplessness guides the wandering thought in their breasts, so that they are carried along stupefied like people deaf and blind. Unreasonable crowds, who hold that it is and is not the same and not the same, all things travel in opposite directions!

(7) For this will never be proved, that the things that are not are; and do you restrain your thought from this way of inquiry.

(8) One path only is left for us to speak of, namely, that <it is>. In this path are very many tokens that what is is uncreated and indestructible; for it is complete, immovable, and without end. Nor was it ever, nor will it be; for now it is, all at once, a continuous one. For what kind of origin for it will you look for? In what way and from what source could it have drawn its increase? . . . I will not let you say nor think that it came from what is not; for it can neither be thought nor uttered that anything is not. And, if it came from nothing, what need could have made it arise later rather than sooner? Therefore must it either be altogether or be not at all. Nor will the force of truth suffer anything to arise besides itself from that which is not. For this reason, justice does not loose her fetters and let anything come into being or pass away, but holds it fast. Our judgment thereon depends on this: "Is it or is it not?" Surely it is decided, as it must be, that we are to set aside the one way as unthinkable and nameless (for it is no true way), and that the other path is real and true. How, then, can what is be going to be in the future? Or how could it come into being? If it came into being, it is not; nor is it if it is going to be in the future. Thus is becoming extinguished and passing away not to be heard of.

Nor is it divisible, since it is all alike, and there is no more of it in one place than in another, to hinder it from holding together, nor less of it, but everything is full of what is. For this reason it is wholly continuous; for what is, is in contact with what is.

Moreover, it is immovable in the bonds of mighty chains, without beginning and without end; since coming into being and passing away have been driven afar, and true belief has cast them away. It is the same, and it rests in the self-same place, abiding in itself. And thus it remains constant in its place; for hard necessity keeps it in the bonds of the limit that holds it fast on every side. For this reason it is not permitted to what is to be infinite; for it is in need of nothing; while, if it were infinite, it would stand in need of everything.

The thing that can be thought and that for the sake of which the thought exists is the same; for you cannot find thought without something that is, as to which it is uttered. And there is not, and never will be, anything besides what is, since fate has chained it so as to be whole and immovable. For this reason all these things are but names which mortals have given, believing them to be true-coming into being and passing away, being and not being, change of place and alteration of bright color.

Since, then, it has a furthest limit, it is complete on every side, like the mass of a rounded sphere, equally poised from the center in every direction; for it cannot be greater or smaller in one place than in another. For there is no nothing that could keep it from reaching out equally, nor can anything that is be more here and less there than what is, since it is all inviolable. For the point from which it is equal in every direction tends equally to the limits.

<The Way of Belief>

Here will I close my trustworthy speech and thought about the truth. In the future, learn the beliefs of mortals, giving ear to the deceptive ordering of my words.

Mortals have made up their minds to name two forms, one of which they should not name, and that is where they go astray from the truth. They have distinguished them as opposite in form, and have assigned to them marks distinct from one another. To the one they give out the fire of heaven, gentle, very light, in every direction the same as itself, but not the same as the other. The other is just the opposite to it, dark night, a compact and heavy body. Of these I tell you the whole arrangement as it seems likely; for so no thought of mortals will ever outstrip you.

(9) Now that all things have been named light and night, and the names which belong to the power of each have been assigned to these things and to those, everything is full at once of light and dark night, both equal, since neither has anything to do with the other.

(10, 11) And you will know the substance of the sky, and all the signs in the sky, and the radiant works of the glowing sun's pure torch, and from where they arose. And you will learn likewise of the wandering deeds of the round-faced moon, and of her substance. You will know, too, the heavens that surround us, from where they arose, and how Necessity took them and bound them to keep the limits of the stars . . . how the earth, and the sun, and the moon, and the sky that is common to all, and the Milky Way, and the outermost Olympus, and the burning might of the stars arose.

(12) The narrower bands were filled with unmixed fire, and those next them with night, and in the midst of these rushes their portion of fire. In the midst of these is the divinity that directs the course of all things; for she is the beginner of all painful birth and all propagation, driving the female to the embrace of the male, and the male to that of the female.

(13) First of all the gods she contrived Eros.

(14) Shining by night with borrowed light, wandering round the earth.

(15) Always looking to the beams of the sun.

(16) For just as thought stands at any time to the mixture of its, erring organs, so does it come to people; for that which thinks is the same, namely, the substance of the limbs, in each and every person; for their thought is that of which there is more in them.

(17) On the right boys; on the left girls.

(19) Thus, according to people's opinions, did things come into being, and thus they are now. In time they will grow up and pass away. To each of these things people have assigned a fixed name.

* * * *

EMPEDOCLES

Fragments

(1) And do you give ear, Pausanias, son of Anchitus the wise!

(2) For straitened are the powers that are spread over their bodily parts, and many are the woes that burst in on them and blunt the edge of their careful thoughts! They observe but a brief span of a life that is no life, and, doomed to swift death, are taken up and fly off like smoke. Each is convinced of that alone which he had chanced upon as he is hurried every way, and idly boasts he has found the whole. So hardly can these things be seen by the eyes or heard by the ears of people, so hardly grasped by their mind! Nevertheless, you, since you have found your way hither, will learn no more than mortal mind has power.

(3) . . . to keep within your dumb heart.

(4) But, O you gods, turn aside from my tongue the madness of those people. Bless my lips and make a pure stream flow from them I And you, much-wooed, white-armed Virgin Muse, do I urge that I may hear what is lawful for the children of a day I Speed me on my way from the abode of holiness and drive my willing car! You will not lift garlands of glory and honor at the hands of mortals on condition of speaking in your pride beyond that which is lawful and right, and so to gain a seat upon the heights of wisdom.

Go to now, consider with all your powers in what way each thing is clear. Hold not your sight in greater credit as compared with your hearing, nor value your resounding ear above the dear instructions of your tongue; and do not withhold your confidence in any of your other bodily parts by which there is an opening for understanding, but consider

everything in the way it is clear.

(5) But it is all too much the way of low minds to disbelieve those better. Do you learn as the sure testimonies of my Muse bid you, when my words have been divided in your heart.

(6) Hear first the four roots of all things: shining Zeus, life-bringing Hera, Aidoneus and Nestis whose tear-drops are a well-spring to mortals.

(7) . . .uncreated.

(8) And I will tell you another thing. There is no substance of any of all the things that die, nor any cessation for them of depraved death. They are only a mingling and interchange of what has been mingled. Substance is but a name given to these things by people.

(9) But they (hold?) that when Light and Air (chance?) to have been mingled in the fashion of a human, or in the fashion of the race of wild beasts or of plants or birds, that that is to be born, and when these things have been separated once more, they call it (wrongly?) woeful death. I follow the custom and call it so myself.

(10) Avenging death.

(11, 12) Fools! for they have no far-reaching thoughts, who deem that what before was not comes into being, or that anything can perish and be utterly destroyed. For it cannot be that anything can arise from what in no way is, and it is impossible and unheard of that what is should perish; for it will always be, wherever one may keep putting it.

(13) And in the all there is nothing empty and nothing too full.

(14) In the all there is nothing empty. From where, then, could anything come to increase it?

(15) A person who is wise in such matters would never surmise in his heart that as long as mortals have what they call their life, so long they are, and suffer good and bad; while before they were formed and after they have been dissolved they are just nothing at all.

(16) For even as they (Strife and Love) were previously, so too they will be; nor ever, methinks, will boundless time be emptied of that pair.

(17) I will tell you a twofold tale. At one time it grew to be one only out of many; at another, it divided up to be many instead of one. There is a double becoming of perishable things and a double passing away. The coming together of all things brings one generation into being and destroys it; the other grows up and is scattered as things become divided. And these things never cease continually changing places, at one time all uniting in one through Love, at another each carried in different directions by the repulsion of Strife. Thus, as far as it is their nature to

grow into one out of many, and to become many once more when the one is parted asunder, so far they come into being and their life abides not. But, inasmuch as they never cease changing their places continually, so far they are ever immovable as they go round the circle of existence.

But come, listen to my words, for it is learning that increases wisdom. As I said before, when I declared the heads of my discussion, I will tell you a twofold tale. At one time it grew together to be one only out of many, at another it parted asunder so as to be many instead of one; Fire and Water and Earth and the mighty height of Air; dread Strife, too, apart from these, of equal weight to each, and Love in their midst, equal in length and breadth. Her do you contemplate with your mind, nor sit with dazed eyes. It is she that is known as being implanted in the frame of mortals. It is she that makes them have thoughts of love and work the works of peace. They call her by the names of joy and Aphrodite. Her has no mortal yet marked moving round among them, but do you attend to the undeceitful ordering of my discussion.

For all these are equal and alike in age, yet each has a different prerogative and its own peculiar nature, but they gain the upper hand in turn when the time comes round. And nothing comes into being besides these, nor do they pass away; for, if they had been passing away continually, they would not be now, and what could increase this all and from where could it come? How, too, could it perish, since no place is empty of these things? There are these alone; but, running through one another, they become now this, now that, and like things always.

(18) Love.

(19) Clinging love. Love.

(20) This (the contest of Love and Strife) is manifest in the mass of mortal limbs. At one time all the limbs that are the body's portion are brought together by Love in blooming life's high Season; at another, severed by cruel Strife, they wander each alone by the breakers of life's sea. It is the same with plants and the fish that make their homes in the waters, with the beasts that have their lairs on the hills and the seabirds that sail on wings.

(21) Come now, look at the things that bear witness to my earlier discussion, if so be that there was any shortcoming as to their form in the earlier list. Observe the sun, everywhere bright and warm, and all the immortal things that are bathed in heat and bright radiance. Observe the rain, everywhere dark and cold; and from the earth issue things close-pressed and solid. When they are in strife all these are different in form and separated; but they come together in love, and are desired by one another.

For out of these have sprung all things that were and are and will be-trees and men and women, beasts and birds and the fishes that live in the waters, yea, and the gods that live long lives and are highest ranking in honor.

For there are these alone; but, running through one another, they take different shapes -- so much does mixture change them.

(22) For all of these -- sun, earth, sky, and sea -- are at one with all their parts that are cast far and wide from them in mortal things. And even so all things that are more adapted for mixture are like to one another and united in love by Aphrodite. Those things, again, that differ most in origin, mixture and the forms imprinted on each, are most hostile, being altogether unaccustomed to unite and very sorry by the bidding of Strife, since it has wrought their birth.

(23) Just as when painters are elaborating temple-offerings, people whom wisdom has well taught their art, -- they, when they have taken pigments of many colors with their hands, mix them in due proportion, more of some and less of others, and from them produce shapes like unto all things, making trees and men and women, beasts and birds and fishes that live in the waters, yea, and gods, that live long lives, and are highest ranking in honor -- so don't let the error prevail over your mind, that there is any other source of all the perishable creatures that appear in countless numbers. Know this for sure, for you have heard the tale from a goddess.

(24) Stepping from summit to summit, not to travel only one path of words to the end. . . .

(25) What is right may well be said even twice.

(26) For they prevail in turn as the circle comes round, and pass into one another, and grow great in their appointed turn.

There are these alone; but, running through one another, they become people and the tribes of beasts. At one time they are all brought together into one order by Love; at another, they are carried each in different directions by the repulsion of Strife, till they grow once more into one and are wholly subdued. Thus in so far as they are wont to grow into one out of many, and again divided become more than one, so far they come into being and their life is not lasting; but in so far as they never cease changing continually, so far are they always, immovable in the circle.

(27) There (1n the sphere) are distinguished neither the swift limbs of the sun, no, nor the shaggy earth in its might, nor the sea, -- so fast was the god bound in the close covering of Harmony, spherical and round, rejoicing in his circular solitude.

(27a) There is no discord and no unseemly strife in his limbs.

(28) But he was equal on every side and quite without end, spherical and round, rejoicing in his circular solitude.

(29) Two branches do not spring from his back, he has no feet, no swift knees, no fruitful parts; but he was spherical and equal on every side.

(30, 31) But when Strife was grown great in the limbs of the god and sprang to claim his prerogatives, in the fullness of the alternate time set for them by the mighty oath, . . . for all the limbs of the god in turn quaked.

(32) The joint binds two things.

(33) Even as when fig juice rivets and binds white milk ...

(34) Cementing meal with water ...

(35, 36) But now I will retrace my steps over the paths of song that I have traveled before, drawing from my saying a new saying. When Strife was fallen to the lowest depth of the vortex, and Love had reached to the center of the whirl, in it do all things come together so as to be one only; not all at once, but coming together at their will each from different quarters; and, as they mingled, strife began to pass out to the furthest limit. Yet many things remained unmixed, alternating with the things that were being mixed, namely, all that Strife not fallen yet retained; for it had not yet altogether retired perfectly from them to the outermost boundaries of the circle. Some of it still remained within, and some had passed out from the limbs of the All. But in proportion as it kept rushing out, a soft, immortal stream of blameless Love kept running in, and immediately those things became mortal which had been immortal before, those things were mixed that had before been unmixed, each changing its path. And, as they mingled, countless tribes of mortal creatures were scattered abroad endowed with all manner of forms, a wonder to observe.

(37) Earth increases its own mass, and Air swells the bulk of Air.

(38) Come, I will now tell you first of all the beginning of the sun, and the sources from which have sprung all the things we now observe, the earth and the billowy sea, the damp vapor and the Titan air that binds his circle fast round all things.

(39) If the depths of the earth and the vast air were infinite, a foolish saying which has been vainly dropped from the lips of many mortals, though they have seen but a little of the all ...

(40) The sharp-darting sun and the gentle moon.

(41) But (the sunlight) is gathered together and circles round the mighty heavens.

(42) And she cuts off his rays as he goes above her, and casts a shadow on as much of the earth as is the breadth of the pale-faced moon.

(43) Even so the sunbeam, having struck the broad and

mighty circle of the moon, returns at once, running so as to reach the sky.

(44) It flashes back to Olympus with untroubled appearance.

(45, 46) There circles round the earth a round borrowed light, as the nave of the wheel circles round the furthest (goal).

(47) For she gazes at the sacred circle of the lordly sun opposite.

(48) It is the earth that makes night by coming before the lights.

(49) . . .of solitary, blind-eyed night.

(50) And Iris brings wind or mighty rain from the sea.

(51) (Fire) swiftly rushing upwards . . .

(52) And many fires bum beneath the earth.

(53) For so it (the air) chanced to be running at that time, though often otherwise.

(54) But the air sank down upon the earth with its long roots.

(55) Sea the sweat of the earth.

(56) Salt was solidified by the impact of the sun's beams.

(57) On it (the earth) many heads sprung up without necks and arms wandered bare and deprived of shoulders. Eyes strayed up and down in want of foreheads.

(58) Solitary limbs wandered seeking for union.

(59) But, as divinity was mingled still further with divinity, these things joined together as each might chance, and many other things besides them continually arose.

(60) Clumsy creatures with countless hands.

(61) Many creatures with faces and breasts looking in different directions were born; some, offspring of oxen with faces of people, while others, again, arose as offspring of people with the heads of oxen, and creatures in whom the nature of women and men was mingled, furnished with sterile parts.

(62) Come now, hear how the Fire as it was separated caused the night-born shoots of men and tearful women to arise; for my tale is not off the point nor uninformed. Whole-natured forms first arose from the earth, having a portion both of water and fire. These did the fire, desirous of reaching its like, send up, showing as yet neither the charming form of the limbs, nor yet the voice and parts that

are proper to men.

(63) . . .But the substance of (the child's) limbs is divided between them, part of it in men's (and part in women's body).

(64) And upon him came desire reminding him through sight.

(65) . . .And it was poured out in the purified parts; and when it met with cold, women arose from it.

(66) The divided meadows of Aphrodite.

(67) For in its warmer part the womb produces males, and that is why men are dark and more manly and shaggy.

(68) On the tenth day of the eighth month it turns to a white putrefaction."

(69) Double bearing.

(70) Sheepskin.

(71) But if your assurance of these things was in any way deficient as to how, out of Water an(f Earth and Air and Fire mingled together, arose the forms and colors of all those mortal things that have been fitted together by Aphrodite, and so are now come into being...

(72) How tall trees and the fishes in the sea . . .

(73) And even as at that time Kypris, preparing warmth, after she had moistened the Earth in water, gave it to swift fire to harden it...

(74) Leading the songless tribe of fertile fish.

(75) All of those which are dense within and rare without, having received a weakness of this kind at the hands of Kypris . . . .

(76) This you may see in the heavy-backed shellfish that live in the sea, in sea-snails and the stony-skinned turtles. In them you may see that the earthy part lives on the uppermost surface of the skin.

(77-78) It is moisture that makes evergreen trees flourish with abundance of fruit the whole year round.

(79) And so first of all tall olive trees bear eggs . . . .

(80) For this reason pomegranates are late-born and apples succulent.

(81) Wine is the water from the bark, putrefied in the wood.

(82) Hair and leaves, and thick feathers of birds, and the scales that grow on mighty limbs, are the same thing.

(83) But the hair of hedgehogs is sharp-pointed and bristles on their backs.

(84) And even as when a person thinking to travel through a stormy night, gets him ready a lantern, a flame of blazing fire, fastening to it horn plates to keep out all manner of winds, and they scatter the blast of the winds that blow, but the light leaping out through them, shines across the threshold with unfailing beams, as much of it as is finer; even so did she (Love) then entrap the elemental fire, the round pupil, confined within membranes and delicate tissues, which are pierced through and through with wondrous passages. They keep out the deep water that surrounds the pupil, but they let through the fire, as much of it as is finer.

(85) But the gentle flame (of the eye) has but a scanty portion of earth.

(86) Out of these divine Aphrodite fashioned unwearying eyes.

(87) Aphrodite fitting these together with rivets of love.

(88) One vision is produced by both the eyes.

(89) Know that emanations flow from all things that have come into being.

(90) So sweet lays hold of sweet, and bitter rushes to bitter; acid comes to acid, and warm couples with warm.

(91) Water fits better into wine, but it will not (mingle) with oil.

(92) Copper mixed with tin.

(93) The bloom of scarlet dye mingles with the gray linen.

(94) And the black color at the bottom of a river arises from the shadow. The same is seen in hollow caves.

(95) Since they (the eyes) first grew together in the hands of Kypris.

(96) The kindly earth received in its broad funnels two parts of gleaming Nestis out of the eight, and four of Hephaistus. So arose white bones divinely fitted together by the cement of proportion.

(97) The spine (was broken).

(98) And the earth, anchoring in the perfect harbors of Aphrodite, meets with these in nearly equal proportions, with Hephaistus and Water and gleaming Air-either a little more of it, or less of them and more of it. From these did blood arise and the manifold forms of flesh.

(99) The bell... the fleshy sprout (of the ear).

(100) Thus do all things draw breath and breathe it out again. All have bloodless tubes of flesh extended over the surface of their bodies; and at the mouths of these the outermost surface of the skin is perforated all over with pores closely packed together, so as to keep in the blood while a free passage is cut for the. air to pass through. Then, when the thin blood recedes from these, the bubbling air rushes in with an impetuous surge; and when the blood runs back it is breathed out again. Just as when a girl, playing with a water-clock of shining brass, puts the orifice of the pipe upon her comely hand, and dips the water-clock into the yielding mass of silvery water -- the stream does not then flow into the vessel, but the bulk of the air inside, pressing upon the close-packed perforations, keeps it out till she uncovers the compressed stream; but then air escapes and an equal volume of water runs in, -- just in the same way, when water occupies the depths of the brazen vessel and the opening and passage is stopped up by the human hand, the air outside, striving to get in, holds the water back at the gates of the ill-sounding neck, pressing upon its surface, till she lets go with her hand. Then, on the contrary, just in the opposite way to what happened before, the wind rushes in and an equal volume of water runs out to make room. Even so, when the thin blood that surges through the limbs rushes backwards to the interior, immediately the stream of air comes in with a rushing swell; but when the blood runs back the air breathes out again in equal quantity.

(101) (The dog) with its nostrils tracing out the fragments of the beast's limbs, and the breath from their feet that they leave in the soft grass.

(102) Thus all things have their share of breath and smell.

(103, 104) Thus have all things thought by fortune's will. And inasmuch as the rarest things came together in their fall.

(105) (The heart), dwelling in the sea of blood that runs in opposite directions, where chiefly is what people call thought; for the blood round the heart is the thought of people.

(106) For the wisdom of people grows according to what is before them.

(107) For out of these are all things formed and fitted together, and by these do people think and feel pleasure and pain.

(108) And just so far as they grow to be different, so far do different thoughts ever present themselves to their minds (in dreams).

(109) For it is with earth that we see Earth, and Water with water; by air we see bright Air, by fire destroying Fire. By love do we see Love, and Hate by grievous hate.

(110) For if, supported on your steadfast mind, you wilt contemplate these things with good intent and faultless care, then will you have all these things in abundance throughout your life, and you will gain many others from them. For these things grow of themselves into your heart, where is each person's true nature. But if you strive after things of another kind, as it is the way with people that ten thousand sorry matters blunt their careful thoughts, soon will these things desert you when the time comes round; for they long to return once more to their own kind; for know that all things have wisdom and a share of thought.

And you will learn all the drugs that are a defense against ills and old age; since for you alone will I accomplish all this. You will arrest the violence of the weariless winds that arise to sweep the earth and waste the fields; and again, when you so desire, you will bring back their blasts in return. You will cause for people a seasonable drought after the dark rains, and again you will change the summer drought for streams that feed the trees as they pour down from the sky. You will bring back from Hades the life of a dead person.

<Purifications>

(112) Friends, that inhabit the great town looking down on the yellow rock of Akragas, up by the citadel, busy in considerable works, harbors of honor for the stranger, people unskilled in meanness, all hail. I go about among you an immortal god, no mortal now, honored among all as is proper, crowned with decorations and flowery garlands. Immediately, whenever I enter with these in my train, both men and women, into the flourishing towns, is reverence done me; they go after me in countless throngs, asking of me what is the way to gain; some desiring oracles, while some, who for many a weary day have been pierced by the grievous pangs of all manner of sickness, beg to hear from me the word of healing.

(113) But why do I harp on these things, as if it were any great matter that I should surpass mortal, perishable humans?

(114) Friends, I know indeed that truth is, in the words I shall utter, but it is hard for people, and jealous are they of the assault of belief on their souls.

(115) There is an oracle of Necessity, an ancient ordinance of the gods, eternal and sealed fast by broad oaths, that whenever one of the demons, whose portion is length of days, has sinfully polluted his hands with blood, or followed strife and forsworn himself, he must wander thrice ten thousand seasons from the abodes of the blessed, being born throughout the time in all manners of mortal forms, changing one toilsome path of life for another. For the mighty Air drives him into the Sea, and the Sea spews him on the dry Earth; Earth tosses him into the beams of the blazing Sun, and he flings him back to the eddies of Air. One takes him from the other, and all reject him. One of

these I now am, an exile and a wanderer from the gods, for that I put my trust in insensate strife.

(116) Charis loathes intolerable Necessity.

(117) For I have been ere now a boy and a girl, a bush and a bird and a dumb fish in the sea.

(118) I wept and I wailed when I saw the unfamiliar land.

(119) From what honor, from what. a height of bliss have I fallen to go about among mortals here on earth.

(120) We have come under this roofed-in cave.

(121) . . . the joyless land, where are Death and Wrath and troops of Dooms besides; and parching plagues and rot and floods roam in darkness over the meadow of Ate.

(122, 123) There were Chthonie and far-sighted Heliope, bloody Discord and gentle-appearanced Harmony, Kallisto and Aischre, Speed and Tarrying, lovely Truth and dark-haired Uncertainty, Birth and Decay, Sleep and waking, Movement and Immobility, crowned Majesty and Meanness, Silence and Voice.

(124) Alas, O wretched race of mortals, sore unblessed: such are the strifes and groanings from which you have been born!

(125) From living creatures he made them dead, changing their forms.

(126) (The goddess) clothing them with a strange garment of flesh.

(127) Among beasts they become lions that make their lair on the hills and their couch on the ground; and laurels among trees with lush foliage.

(128) Nor had they any Ares for a god nor Kydoimos, no nor King Zeus nor Kronus nor Poseidon, but Kypris the Queen. . . . Her did they propitiate with holy gifts, with painted figure and perfumes of cunning fragrance, with offerings of pure myrrh and sweet-smelling frankincense, casting on the ground offerings of brown honey. And the altar did not reek with pure bull's blood, but this was held in the greatest abomination among people, to cat the considerable limbs after tearing out the life.

(129) And there was among them a person of rare knowledge, most skilled in all manner of wise works, a person who had won the utmost wealth of wisdom; for whenever he strained with all his mind, he easily saw everything of all the things that are, in ten, indeed, twenty lifetimes of people.

(130) For all things were tame and gentle to humans, both beasts and birds, and friendly feelings were kindled everywhere.

(131) If ever, as regards the things of a day, immortal Muse, you did deign to take thought for my endeavor, then stand by me once more as I pray to you, O Kalliopeia, as I utter a pure discussion concerning the blessed gods.

(132) Happy is the person who has gained the riches of divine wisdom; wretched he who has a dim opinion of the gods in his heart.

(133) It is not possible for us to set God before our eyes, or to lay hold of him with our hands, which is the broadest way of persuasion that leads into the heart of people.

(134) For he is not furnished with a human head on his body, two branches do not sprout from his shoulders, he has no feet, no swift knees, nor hairy parts; but he is only a sacred and unutterable mind flashing through the whole world with rapid thoughts.

(135) (This is not lawful for some and unlawful for others;) but the law for all extends everywhere, through the wide-ruling air and the infinite light of heaven.

(136) Will you not cease from this ill-sounding slaughter? See you not that you are devouring one another in the thoughtlessness of your hearts?

(137) And the father lifts up his own son in a changed form and slays him with a prayer. Infatuated fool I And they run up to the sacrificers, begging mercy, while he, deaf to their cries, slaughters them in his halls and gets ready the evil feast. In like manner does the son seize his father, and children their mother, tear out their life and eat the kindred flesh.

(138) Draining their life with bronze.

(139) Ah, woe is me that the pitiless day of death did not destroy me ere ever I wrought evil deeds of devouring with my lips!

(140) Abstain wholly from laurel leaves.

(141) Wretches, utter wretches, keep your hands from beans!

(142) Him will the roofed palace of aigis-bearing Zeus never rejoice, nor yet the house of...

(143) Wash your hands, cutting the water from the five springs in the unyielding bronze

(144) Fast from wickedness!

(145) Therefore are you distraught by grievous wickednesses, and will not unburden your souls of wretched sorrows.

(146, 147) But, at the last, they appear among mortal humans as prophets, song-writers, physicians, and princes;

and thence they rise up as gods highest ranking in honor, sharing the hearth of the other gods and the same table, free from human woes, safe from destiny, and incapable of hurt.

(148) . . .Earth that envelops the person.

* * * *

ANAXAGORAS

Fragments

(1) all things were together, infinite both in number and in smallness; for the small too was infinite. And, when all things were together, none of them could be distinguished for their smallness. For air and aether prevailed over all things, being both of them infinite; for among all things these are the greatest both in quantity and size.

(2) For air and aether are separated off from the mass that surrounds the world, and the surrounding mass is infinite in quantity.

(3) Nor is there a least of what is small, but there is always a smaller; for it cannot be that what is should cease to be by being cut. But there is also always something, greater than what is great, and it is equal to the small in amount, and, compared with itself, each thing is both great and small.

(4) And since these things are so, we must suppose that there are contained many things and of all sorts in the things that are uniting, seeds of all things, with all sorts of shapes and colors and tastes, and that people have been formed in them, and the other animals that have life, and that these people have inhabited cities and cultivated fields as with us; and that they have a sun and a moon and the rest as with us; and that their earth produces for them many things of all kinds of which they gather the best together into their dwellings, and use them. Thus much have I said with regard to separating off, to show that it will not be only with us that things are separated off, but elsewhere too.

But before, they were separated off, when all things were together, not even was any color distinguishable. For the mixture of all things prevented it -- of the moist and the dry, and the warm and the cold, and the light and the dark, and of much earth that was in it, and of a multitude of innumerable seeds in no way like each other. For none of the other things either is like any other. And these things being so, we must hold that all things are in the whole.

(5) And those things having been thus decided, we must know that all of them are neither more nor less; for it is not possible for them to be more than all, and all are always equal.

(6) And since the portions of the great and of the

small are equal in amount, for this reason, too, all things will be in everything; nor is it possible for them to be apart, but all things have a portion of everything. Since it is impossible for there to be a least thing, they cannot be separated, nor come to be by themselves; but they must be now, just as they were in the beginning, all together. And in all things many things are contained, and an equal number both in the greater and in the smaller of the things that are separated off.

(7) . . . So that we cannot know the number of the things that are separated off, either in word or deed.

(8) The things that are in one world are not divided nor cut off from one another with a hatchet, neither the warm from the cold nor the cold from the warm.

(9) . . . as these things revolve and are separated off by the force and swiftness. And the swiftness makes the force. Their swiftness is not like the swiftness of any of the things that are now among people, but in every way many times as swift.

(10) How can hair come from what is not hair, or flesh from what is not flesh?

(11) In everything there is a portion of everything except Nous, and there are some things in which there is Nous also.

(12) All other things partake in a portion of everything, while Nous is infinite and self-ruled, and is mixed with nothing, but is alone, itself by itself. For if it were not by itself, but were mixed with anything else, it would partake in all things if it were mixed with any; for in everything there is a portion of everything, as has been said by me in what goes before, and the things mixed with it would hinder it, so that it would have power over nothing in the same way that it has now being alone by itself. For it is the thinnest of all things and the purest, and it has all knowledge about everything and the greatest strength; and Nous has power over all things, both greater and smaller, that have life. And Nous had power over the whole revolution, so that it began to revolve in the beginning. And it began to revolve first from a small beginning; but the revolution now extends over a larger space, and will extend over a larger still. And all the things that are mingled together and separated off and distinguished are all known by Nous. And Nous set in order all things that were to be, and all things that were and are not now and that are, and this revolution in which now revolve the stars and the sun and the moon, and the air and the aether that are separated off. And this revolution caused the separating off, and the rare is separated off from the dense, the warm from the cold, the light from the dark, and the dry from the moist. And there are many portions in many things. But no thing is altogether separated off nor distinguished from anything else except Nous. And all Nous is alike, both the greater and the smaller; while nothing else is like anything else, but each single thing is and was most manifestly those things of which it has most in it.

(13) And when Nous began to move things, separating off took place from all that was moved, and so much as Nous set in motion was all separated. And as things were set in motion and separated, the revolution caused them to be separated much more.

(14) And Nous, which ever is, is certainly there, where everything else is, in the surrounding mass, and in what has been united with it and separated off from it.

(15) The dense and the moist and the cold and the dark came together where the earth is now, while the rare and the warm and the dry (and the bright) went out towards the further part of the aether.

(16) From these as they are separated off earth is solidified for from mists water is separated off, and from water earth. From the earth stones are solidified by the cold, and these rush outwards more than water.

(17) The Hellenes follow a wrong usage in speaking of coming into being and passing away; for nothing comes into being or passes away, but there is mingling and separation of things that are. So they would be right to call coming into being mixture, and passing away separation.

(18) It is the sun that puts brightness into the moon.

(19) We call rainbow the reflection of the sun in the clouds. Now it is a sign of storm; for the water that flows round the cloud causes wind or pours down in rain.

(20) With the rise of the Dogstar (?) people begin the harvest with its setting they begin to till the fields. It is hidden for forty days and nights.

(21) From the weakness of our senses we are not able to judge the truth.

(21a) What appears is a vision of the unseen.

(21b) (We can make use of the lower animals) because we use our own experience and memory and wisdom and art.

(22) What is called "birds' milk" is the white of the egg.

Testimonial (Theophrastus)

But Anaxagoras says that perception is produced by opposites; for like things cannot be effected by like. He attempts to give, a detailed enumeration of the particular senses. We see by means of the image in the pupil; but no image is cast upon what is of the same color, but only on what is different. With most living creatures things are of a different color to the pupil by day, though with some this is so by night, and these are accordingly keen-sighted at that time. Speaking generally, however, night is more of the same color with the eyes than day. And an image is cast on

the pupil by day, because light is a concomitant cause of the image, and because the prevailing color casts an image more readily upon its opposite.

It is in the same way that touch and taste discern their objects. That which is just as warm or just as cold as we are neither warms us nor cools us by its contact; and, in the same way, we do not apprehend the sweet and the sour by means of themselves. We know cold by warm, fresh by salt, and sweet by sour, in virtue of our deficiency in each; for all these are in us to begin with. And we smell and hear in the same manner; the former by means of the accompanying respiration, the latter by the sound penetrating to the brain, for the bone which surrounds this is hollow, and it is upon it that the sound falls.

And an sensation implies pain, a view which would seem to be the consequence of the first assumption, for all unlike things produce pain by their contact. And this pain is made perceptible by the long continuance or by the excess of a sensation. Brilliant colors and excessive noises produce pain, and we cannot live long on the same things. The larger animals are the more sensitive, and, generally, sensation is proportionate to the size of the organs of sense. Those animals which have large, pure, and bright eyes, see large objects and from a great distance, and contrariwise.

And it is the same with hearing. Large animals can hear great and distant sounds, while less sounds pass unperceived; small animals perceive small sounds and those near at hand. It is the same too with smell. Rarefied air has more smell; for, when air is heated and rarefied, it smells. A large animal when it breathes draws in the condensed air along with the rarefied, while a small one draws in the rarefied by itself; so the large one perceives more. For smell is better perceived when it is near than when it is far by reason of its being more condensed, while when dispersed it is weak. But, roughly speaking, large animals do not perceive a rarefied smell, nor small animals a condensed one.

ZENO

Fragments

(1) If what is had no magnitude, it would not even be... But, if it is, each one must have a certain magnitude and a certain thickness, and must be at a certain distance from another, and the same may be said of what is in front of it; for it, too, will have magnitude, and something will be in front of it. It is all the same to say this once and to say it always; for no such part of it will be the last, nor will one thing not be as compared with another. So if things are a many, they must be both small and great, so small as not to have any magnitude at all, and so great as to be infinite.

(2) For if it were added to any other thing it would

not make it any larger; for nothing can gain in magnitude by the addition of what has no magnitude, and thus it follows at once that what was added was nothing. But if, when this is taken away from another thing, that thing is no less; and again, if, when it is added to another thing, that does not increase, it is plain that what was added was nothing, and what was taken away was nothing.

(3) If things are a many, they must be just as many as they are, and neither more nor less. Now, if they are as many as they are, they will be finite in number.

If things are a many, they will be infinite in number;, for there will always be other things between them, and others again between these. And so things are infinite in number.

Testimonial (paraphrased from Aristotle)

(1) You cannot cross a race-course. You cannot traverse an infinite number of points in a finite time. You must traverse the half of any given distance before you traverse the whole, and the half of that again before you can traverse it. This goes on ad infinitum, so that there are an infinite number of points in any given space, and you cannot touch an infinite number one by one in a finite time.

(2) Achilles will never overtake the tortoise. He must first reach the place from which the tortoise started. By that time the tortoise will have got some way ahead. Achilles must then make up that, and again the tortoise will be ahead. He is always coming nearer, but he never makes up to it.

(3) The arrow in flight is at rest. For, if everything is at rest when it occupies a space equal to itself, and what is in flight at any given moment always occupies a space equal to itself, it cannot move.

* * * *

MELISSOS

(1a) If nothing is, what can be said of it as of something real?

(1) What was was ever, and ever will be. For, if it had come into being, it needs must have been nothing before it came into being. Now, if it were nothing, in no wise could anything have arisen out of nothing.

(2) Since, then, it has not come into being, and since it is, was ever, and ever shall be, it has no beginning or end, but is without limit. For, if it had come into being, it would have had a beginning (for it would have begun to come into being at some time or other) and an end (for it would have ceased to come into being at some time or other); but, if it neither began nor ended, and ever was and ever will be, it has no beginning or end; for it is not possible for anything to be ever without all being.

(3) Further, just as it ever is, so it must ever be infinite in magnitude.

(4) But nothing which has a beginning or end is either eternal or infinite.

(5) If it were not one, it would be bounded by something else.

(6) For if it is (infinite), it must be one; for if it were two, it could not be infinite; for then they would be bounded by one another.

(6a) (And, since it is one, it is alike throughout; for if it were unlike, it would be many and not one.)

(7) So then it is eternal and infinite and one and all alike. And it cannot perish nor become greater, nor does it suffer pain or grief. For, if any of these things happened to it, it would no longer be one. For if it is altered, then the real must needs not be all alike, but what was before must pass away, and what was not must come into being. Now, if it changed by so much as a single hair in ten thousand years, it would all perish in the whole of time.

Further, it is not possible either that its order should be changed; for the order which it had before does not perish, nor does that which was not come into being. But, since nothing is either added to it or passes away or is altered, how can any real thing have had its order changed? For if anything became different, that would amount to a change in its order.

Nor does it suffer pain; for a thing in pain could not all be. For a thing in pain could not be ever, nor has it the same power as what is whole. Nor would it be alike, if it were in pain; for it is only from the addition or subtraction of something that it could feel pain, and then it would no longer be alike. Nor could what is whole feel pain; for then what was whole and what was real would pass away, and what was not would, come into being. And the same argument applies to grief as to pain.

Nor is anything empty. For what is empty is nothing. What is nothing cannot be.

Nor does it move; for it has nowhere bring itself to, but is full. For if there were anything empty, it would bring itself to the empty. But, since there is nothing empty, it has nowhere to bring itself to.

And it cannot be dense and rare; for it is not possible for what is rare to be as full as what is dense, but what is rare is at once emptier than what is dense.

This is the way in which we must distinguish between what is full and what is not full. If a thing has room for anything else, and takes it in, it is not full; but if it has no room for anything and does not take it in, it is full.

Now, it must needs be full if there is nothing empty, and if it is full, it-does not move.

(8) This argument, then, is the greatest proof that it is one alone; but the following are proofs of it also. If there were a many, these would have to be of the same kind as I say that the one is. For if there is earth and water, and air and iron, and gold and fire, and if one thing is living and another dead, and if things are black and white and all that people say they really are,-if that is so, and if we see and hear aright, each one of these must be such as we first decided, and they cannot be changed or altered, but each must be just as it is. But, as it is, we say that we see and hear and understand aright, and yet we believe that what is warm becomes cold, and what is cold warm; that what is hard turns soft, and what is soft hard; that what is living dies, and that things are born from what lives not; and that all those things are changed, and that what they were and what they are now are in no way alike. We think that iron, which is hard, is rubbed away by contact with the finger; and so with gold and stone and everything which we fancy to be strong, and that earth and stone are made out of water; so that it turns out that we neither see nor know realities. Now these things do not agree with one another. We said that there were many things that were eternal and had forms and strength of their own, and yet we fancy that they all suffer alteration, and that they change from what we see each time. It is clear, then, that we did not see aright after all, nor are we right in believing that all these things are many. They would not change if they were real, but each thing would be just what we believed it to be; for nothing is stronger than true reality. But if it has changed, what was has passed away, and what was not is come into being. So then, if there were many things, they would have to be just of the same nature as the one.

(9) Now, if it were to exist, it must needs be one; but if it is one, it cannot have body; for, if it had body it would have parts, and would no longer be one.

(10) If what is real is divided, it moves; but if it moves, it cannot be.

* * * *

DIOGENES OF APOLLONIA

Fragments

(1) In the beginning any discussion, it seems to me that one should make one's starting-point something indisputable, and one's expression simple and dignified.

(2) My view is, to sum it all up, that all things are differentiations of the same thing, and are the same thing. And this is obvious; for, if the things which are now in this world-earth, and water, and air and fire, and the other things which we see existing in this world-if any one of these things, I say, were different from any other, different, that is, by having a substance peculiar to itself; and if it were not the same thing that is often

changed and differentiated ' then things could not in any way mix with one another, nor could- they do one another good or harm. Neither could a plant grow out of the earth, nor any animal nor anything else come into being unless things were composed in such a way as to be the same. But all these things arise from the same thing; they are differentiated and take different forms at different times, and return again to the same thing.

(3) For it would not be possible for it without intelligence to be so divided, as to keep the measures of all things, of winter and summer, of day and night, of rains and winds and fair weather. And any one who cares to reflect will find that everything else is disposed in the best possible manner. R. P. 210.

(4) And, further, there are still the following great proofs. Humans and all other animals live upon air by breathing it, and this is their soul and their intelligence, as will be clearly shown in this work; while, when this is taken away, they die, and their intelligence fails.

(5) And my view is, that that which has intelligence is what people call air, and that all things have their course steered by it, and that it has power over all things. For this very thing I hold to be a god," and to reach everywhere, and to dispose everything, and to be in everything; and there is not anything which does not partake in it. Yet no single thing partakes in it just in the same way as another; but there are many modes both of air and of intelligence. For it undergoes many transformations, warmer and colder, drier and moister, more stable and in swifter motion, and it has many other differentiations in it, and an infinite number of colors and tastes. And the soul of all living things is the same, namely, air warmer than that outside us and in which we are, but much colder than that near the sun. And this warmth is not alike in any two kinds of living creatures, nor, for the matter of that, in any two people; but it does not differ much, only so far as is compatible with their being alike. At the same time, it is not possible for any of the things which are differentiated to be exactly like one another till they all once more become the same.

(6) Since, then, differentiation is multiform, living creatures are multiform and many, and they are like one another neither in appearance nor in intelligence, because of the multitude of differentiations. At the same time, they all live, and see, and hear by the same thing, and they all have their intelligence from the same source.

(7) And this itself is an eternal and undying body, but of those things I some come into being and some pass away.

(8) But this, too, appears to me to be obvious, that it is both great, and mighty, and eternal, and undying, and of great knowledge.

ARCHELAUS

Testimonial by Hippolitus

Archelaus was by birth an Athenian, and the son of Apollodorus. He spoke of the mixture of matter in a similar way to Anaxagoras, and of the first principles likewise. He held, however, that there was a certain mixture immanent even in Nous. And he held that there were two efficient causes which were separated off from one another, namely, the warm and the cold. The former was in motion, the latter at rest. When the water was liquefied it flowed to the center, and there being burnt up it turned to earth and air, the latter of which was carried upwards, while the former took up its position below. These, then, are the reasons why the earth is at rest, and why it came into being. It lies in the center, being practically no appreciable part of the universe. (But the air rules over all things), being produced by the burning of the fire, and from its original combustion comes the substance of the heavenly bodies. Of these the sun is the largest, and the moon second; the rest are of various sizes. He says that the heavens were inclined, and that then the sun made fight upon the earth, made the air transparent, and the earth dry; for it was originally a pond, being high at the circumference and hollow in the center. He adduces as a proof of this hollowness that the sun does not rise and set at the same time for all peoples, as it ought to do if the earth were level. As to animals, he says that when the earth was first being warm in the lower part where the warm and the cold were mingled together, many living creatures appeared, and especially people, all having the same manner of life, and deriving their sustenance from the slime; they did not live long, and later on generation from one another began. And people were distinguished from the rest, and set up leaders, and laws, and arts, and cities, and so forth. And he says that Nous is implanted in all animals alike; for each of the animals, as well as humans, makes use of Nous, but some quicker and some slower.

Book I:
Of Wealth, Justice, Moderation, And Their Opposites

Persons of the Dialogue

Socrates, who is the narrator. Cephalus. Glacon. Thrasymachus. Adeimantus. Cleitophon. Polemarchus.

And others who are mute auditors.

The scene is laid in the house of Cephalus at the Piraeus; and the whole dialogue is narrated by Socrates the day after it actually took place to Timaeus Hermocrates, Critias, and a nameless person, who are introduced in the Timaeus.

I WENT down yesterday to the Piraeus with Glaucon, the son of Ariston, that I might offer up my prayers to the goddess; and also because I wanted to see in what manner they would celebrate the festival, which was a new thing. I was delighted with the procession of the inhabitants; but that of the Thracians was equally, if not more, beautiful. When we had finished our prayers and viewed the spectacle, we turned in the direction of the city; and at that instant Polemarchus, the son of Cephalus, chanced to catch sight of us from a distance as we were starting on our way home, and told his servant to run and bid us wait for him. The servant took hold of me by the cloak behind, and said, Polemarchus desires you to wait.

I turned round, and asked him where his master was.

There he is, said the youth, coming after you, if you will only wait.

Certainly we will, said Glaucon; and in a few minutes Polemarchus appeared, and with him Adeimantus, Glaucon's brother, Niceratus, the son of Nicias, and several others who had been at the procession.

Polemarchus said to me, I perceive, Socrates, that you and your companion are already on your way to the city.

You are not far wrong, I said.

But do you see, he rejoined, how many we are?

Of course.

And are you stronger than all these? for if not, you will have to remain where you are.

May there not be the alternative, I said, that we may persuade you to let us go?

But can you persuade us, if we refuse to listen to you? he said.

Certainly not, replied Glaucon.

Then we are not going to listen; of that you may be assured.

Adeimantus added: Has no one told you of the torchrace on horseback in honor of the goddess which will take place in the evening?

With horses! I replied. That is a novelty. Will horsemen carry torches and pass them one to another during the race?

Yes, said Polemarchus; and not only so, but a festival will be celebrated at night, which you certainly ought to see. Let us rise soon after supper and see this festival; there will be a gathering of young men, and we will have a good talk. Stay then, and do not be perverse.

Glaucon said, I suppose, since you insist, that we must.

Very good, I replied.

Accordingly we went with Polemarchus to his house; and there we found his brothers Lysias and Euthydemus, and with them Thrasymachus the Chalcedonian, Charmantides the Paeanian, and Cleitophon, the son of Aristonymus. There too was Cephalus, the father of Polemarchus, whom I had not seen for a long time, and I thought him very much aged. He was seated on a cushioned chair, and had a garland on his head, for he had been sacrificing in the court; and there were some other chairs in the room arranged in a semicircle, upon

which we sat down by him. He saluted me eagerly, and then he said:

You don't come to see me, Socrates, as often as you ought: If I were still able to go and see you I would not ask you to come to me. But at my age I can hardly get to the city, and therefore you should come oftener to the Piraeus. For, let me tell you that the more the pleasures of the body fade away, the greater to me are the pleasure and charm of conversation. Do not, then, deny my request, but make our house your resort and keep company with these young men; we are old friends, and you will be quite at home with us.

I replied: There is nothing which for my part I like better, Cephalus, than conversing with aged men; for I regard them as travellers who have gone a journey which I too may have to go, and of whom I ought to inquire whether the way is smooth and easy or rugged and difficult. And this is a question which I should like to ask of you, who have arrived at that time which the poets call the "threshold of old age": Is life harder toward the end, or what report do you give of it?

I will tell you, Socrates, he said, what my own feeling is. Men of my age flock together; we are birds of a feather, as the old proverb says; and at our meetings the tale of my acquaintance commonly is: I cannot eat, I cannot drink; the pleasures of youth and love are fled away; there was a good time once, but now that is gone, and life is no longer life. Some complain of the slights which are put upon them by relations, and they will tell you sadly of how many evils their old age is the cause. But to me, Socrates, these complainers seem to blame that which is not really in fault. For if old age were the cause, I too, being old, and every other old man would have felt as they do. But this is not my own experience, nor that of others whom I have known. How well I remember the aged poet Sophocles, when in answer to the question, How does love suit with age, Sophocles -- are you still the man you were? Peace, he replied; most gladly have I escaped the thing of which you speak; I feel as if I had escaped from a mad and furious master. His words have often occurred to my mind since, and they seem as good to me now as at the time when he uttered them. For certainly old age has a great sense of calm and freedom; when the passions relax their hold, then, as Sophocles says, we are freed from the grasp not of one mad master only, but of many. The truth is, Socrates, that these regrets, and also the complaints about relations, are to be attributed to the same cause, which is not old age, but men's characters and tempers; for he who is of a calm and happy nature will hardly feel the pressure of age, but to him who is of an opposite disposition youth and age are equally a burden.

I listened in admiration, and wanting to draw him out, that he might go on -- Yes, Cephalus, I said; but I rather suspect that people in general are not convinced by you when you speak thus; they think that old age sits lightly upon you, not because of your happy disposition, but because you are rich, and wealth is well known to be a great comforter.

You are right, he replied; they are not convinced: and

there is something in what they say; not, however, so much as they imagine. I might answer them as Themistocles answered the Seriphian who was abusing him and saying that he was famous, not for his own merits but because he was an Athenian: "If you had been a native of my country or I of yours, neither of us would have been famous." And to those who are not rich and are impatient of old age, the same reply may be made; for to the good poor man old age cannot be a light burden, nor can a bad rich man ever have peace with himself.

May I ask, Cephalus, whether your fortune was for the most part inherited or acquired by you?

Acquired! Socrates; do you want to know how much I acquired? In the art of making money I have been midway between my father and grandfather: for my grandfather, whose name I bear, doubled and trebled the value of his patrimony, that which he inherited being much what I possess now; but my father, Lysanias, reduced the property below what it is at present; and I shall be satisfied if I leave to these my sons not less, but a little more, than I received.

That was why I asked you the question, I replied, because I see that you are indifferent about money, which is a characteristic rather of those who have inherited their fortunes than of those who have acquired them; the makers of fortunes have a second love of money as a creation of their own, resembling the affection of authors for their own poems, or of parents for their children, besides that natural love of it for the sake of use and profit which is common to them and all men. And hence they are very bad company, for they can talk about nothing but the praises of wealth. That is true, he said.

Yes, that is very true, but may I ask another question? -- What do you consider to be the greatest blessing which you have reaped from your wealth?

One, he said, of which I could not expect easily to convince others. For let me tell you, Socrates, that when a man thinks himself to be near death, fears and cares enter into his mind which he never had before; the tales of a world below and the punishment which is exacted there of deeds done here were once a laughing matter to him, but now he is tormented with the thought that they may be true: either from the weakness of age, or because he is now drawing nearer to that other place, he has a clearer view of these things; suspicions and alarms crowd thickly upon him, and he begins to reflect and consider what wrongs he has done to others. And when he finds that the sum of his transgressions is great he will many a time like a child start up in his sleep for fear, and he is filled with dark forebodings. But to him who is conscious of no sin, sweet hope, as Pindar charmingly says, is the kind nurse of his age:

"Hope," he says, "cherishes the soul of him who lives in justice and holiness, and is the nurse of his age and the companion of his journey -- hope which is mightiest to sway the restless soul of man."

How admirable are his words! And the great blessing of riches, I do not say to every man, but to a good man, is, that he has had no occasion to deceive or to defraud others, either intentionally or unintentionally; and when he departs to the world below he is not in any apprehension about offerings due to the gods or debts which he owes to men. Now to this peace of mind the possession of wealth greatly contributes; and therefore I say, that, setting one thing against another, of the many advantages which wealth has to give, to a man of sense this is in my opinion the greatest.

Well said, Cephalus, I replied; but as concerning justice, what is it? -- to speak the truth and to pay your debts -- no more than this? And even to this are there not exceptions? Suppose that a friend when in his right mind has deposited arms with me and he asks for them when he is not in his right mind, ought I to give them back to him? No one would say that I ought or that I should be right in doing so, any more than they would say that I ought always to speak the truth to one who is in his condition.

You are quite right, he replied.

But then, I said, speaking the truth and paying your debts is not a correct definition of justice.

Quite correct, Socrates, if Simonides is to be believed, said Polemarchus, interposing.

I fear, said Cephalus, that I must go now, for I have to look after the sacrifices, and I hand over the argument to Polemarchus and the company.

Is not Polemarchus your heir? I said.

To be sure, he answered, and went away laughing to the sacrifices.

Tell me then, O thou heir of the argument, what did Simonides say, and according to you, truly say, about justice?

He said that the repayment of a debt is just, and in saying so he appears to me to be right.

I shall be sorry to doubt the word of such a wise and inspired man, but his meaning, though probably clear to you, is the reverse of clear to me. For he certainly does not mean, as we were just now saying, that I ought to return a deposit of arms or of anything else to one who asks for it when he is not in his right senses; and yet a deposit cannot be denied to be a debt.

True.

Then when the person who asks me is not in his right mind I am by no means to make the return?

Certainly not.

When Simonides said that the repayment of a debt was justice, he did not mean to include that case?

Certainly not; for he thinks that a friend ought always to do good to a friend, and never evil.

You mean that the return of a deposit of gold which is to the injury of the receiver, if the two parties are friends, is not the repayment of a debt -- that is what you would imagine him to say?

Yes.

And are enemies also to receive what we owe to them?

To be sure, he said, they are to receive what we owe them; and an enemy, as I take it, owes to an enemy that which is due or proper to him -- that is to say, evil.

Simonides, then, after the manner of poets, would seem to have spoken darkly of the nature of justice; for he really meant to say that justice is the giving to each man what is proper to him, and this he termed a debt.

That must have been his meaning, he said.

By heaven! I replied; and if we asked him what due or proper thing is given by medicine, and to whom, what answer do you think that he would make to us?

He would surely reply that medicine gives drugs and meat and drink to human bodies.

And what due or proper thing is given by cookery, and to what?

Seasoning to food.

And what is that which justice gives, and to whom?

If, Socrates, we are to be guided at all by the analogy of the preceding instances, then justice is the art which gives good to friends and evil to enemies.

That is his meaning, then?

I think so.

And who is best able to do good to his friends and evil to his enemies in time of sickness?

The physician.

Or when they are on a voyage, amid the perils of the sea?

The pilot.

And in what sort of actions or with a view to what result is the just man most able to do harm to his enemy and good to his friend?

In going to war against the one and in making alliances with the other.

But when a man is well, my dear Polemarchus, there is no need of a physician?

No.

And he who is not on a voyage has no need of a pilot?

No.

Then in time of peace justice will be of no use?

I am very far from thinking so.

You think that justice may be of use in peace as well as in war?

Yes.

Like husbandry for the acquisition of corn?

Yes.

Or like shoemaking for the acquisition of shoes -- that is what you mean?

Yes.

And what similar use or power of acquisition has justice in time of peace?

In contracts, Socrates, justice is of use.

And by contracts you mean partnerships?

Exactly.

But is the just man or the skilful player a more useful and better partner at a game of draughts?

The skilful player.

And in the laying of bricks and stones is the just man a more useful or better partner than the builder?

Quite the reverse.

Then in what sort of partnership is the just man a better partner than the harpplayer, as in playing the harp the harpplayer is certainly a better partner than the just man?

In a money partnership.

Yes, Polemarchus, but surely not in the use of money; for you do not want a just man to be your counsellor in the purchase or sale of a horse; a man who is knowing about horses would be better for that, would he not?

Certainly.

And when you want to buy a ship, the shipwright or the pilot would be better?

True.

Then what is that joint use of silver or gold in which the just man is to be preferred?

When you want a deposit to be kept safely.

You mean when money is not wanted, but allowed to lie?

Precisely.

That is to say, justice is useful when money is useless?

That is the inference.

And when you want to keep a pruninghook safe, then justice is useful to the individual and to the State; but when you want to use it, then the art of the vinedresser?

Clearly.

And when you want to keep a shield or a lyre, and not to use them, you would say that justice is useful; but when you want to use them, then the art of the soldier or of the musician?

Certainly.

And so of all other things -- justice is useful when they are useless, and useless when they are useful?

That is the inference.

Then justice is not good for much. But let us consider this further point: Is not he who can best strike a blow in a boxing match or in any kind of fighting best able to ward off a blow?

Certainly.

And he who is most skilful in preventing or escaping from a disease is best able to create one?

True.

And he is the best guard of a camp who is best able to steal a march upon the enemy?

Certainly.

Then he who is a good keeper of anything is also a good thief?

That, I suppose, is to be inferred.

Then if the just man is good at keeping money, he is good at stealing it.

That is implied in the argument.

Then after all, the just man has turned out to be a thief. And this is a lesson which I suspect you must have learnt out of Homer; for he, speaking of Autolycus, the maternal grandfather of Odysseus, who is a favorite of his, affirms that

"He was excellent above all men in theft and perjury."

And so, you and Homer and Simonides are agreed that justice is an art of theft; to be practised, however, "for the good of friends and for the harm of enemies" -- that was what you were saying?

No, certainly not that, though I do not now know what I did say; but I still stand by the latter words.

Well, there is another question: By friends and enemies do we mean those who are so really, or only in seeming?

Surely, he said, a man may be expected to love those whom he thinks good, and to hate those whom he thinks evil.

Yes, but do not persons often err about good and evil: many who are not good seem to be so, and conversely?

That is true.

Then to them the good will be enemies and the evil will be their friends? True.

And in that case they will be right in doing good to the evil and evil to the good?

Clearly.

But the good are just and would not do an injustice?

True.

Then according to your argument it is just to injure those who do no wrong?

Nay, Socrates; the doctrine is immoral.

Then I suppose that we ought to do good to the just and harm to the unjust?

I like that better.

But see the consequence: Many a man who is ignorant of human nature has friends who are bad friends, and in that case he ought to do harm to them; and he has good enemies whom he ought to benefit; but, if so, we shall be saying the very opposite of that which we affirmed to be the meaning of Simonides.

Very true, he said; and I think that we had better correct an error into which we seem to have fallen in the use of the words "friend" and "enemy."

What was the error, Polemarchus? I asked.

We assumed that he is a friend who seems to be or who is thought good.

And how is the error to be corrected?

We should rather say that he is a friend who is, as well as seems, good; and that he who seems only and is not good, only seems to be and is not a friend; and of an enemy the same may be said.

You would argue that the good are our friends and the bad our enemies?

Yes.

And instead of saying simply as we did at first, that it is just to do good to our friends and harm to our enemies, we should further say: It is just to do good to our friends when they are good, and harm to our enemies when they are evil?

Yes, that appears to me to be the truth.

But ought the just to injure anyone at all?

Undoubtedly he ought to injure those who are both wicked and his enemies.

When horses are injured, are they improved or deteriorated?

The latter.

Deteriorated, that is to say, in the good qualities of horses, not of dogs?

Yes, of horses.

And dogs are deteriorated in the good qualities of dogs, and not of horses?

Of course.

And will not men who are injured be deteriorated in that which is the proper virtue of man?

Certainly.

And that human virtue is justice?

To be sure.

Then men who are injured are of necessity made unjust?

That is the result.

But can the musician by his art make men unmusical?

Certainly not.

Or the horseman by his art make them bad horsemen?

Impossible.

And can the just by justice make men unjust, or speaking generally, can the good by virtue make them bad?

Assuredly not.

Any more than heat can produce cold?

It cannot.

Or drought moisture?

Clearly not.

Nor can the good harm anyone?

Impossible.

And the just is the good?

Certainly.

Then to injure a friend or anyone else is not the act of a just man, but of the opposite, who is the unjust?

I think that what you say is quite true, Socrates.

Then if a man says that justice consists in the repayment of debts, and that good is the debt which a just man owes to his friends, and evil the debt which he owes to his enemies -- to say this is not wise; for it is not true, if, as has been clearly shown, the injuring of another can be in no case just.

I agree with you, said Polemarchus.

Then you and I are prepared to take up arms against anyone who attributes such a saying to Simonides or Bias or Pittacus, or any other wise man or seer?

I am quite ready to do battle at your side, he said.

Shall I tell you whose I believe the saying to be?

Whose?

I believe that Periander or Perdiccas or Xerxes or Ismenias the Theban, or some other rich and mighty man, who had a great opinion of his own power, was the first to say that justice is "doing good to your friends and harm to your enemies."

Most true, he said.

Yes, I said; but if this definition of justice also breaks down, what other can be offered?

Several times in the course of the discussion Thrasymachus had made an attempt to get the argument into his own hands, and had been put down by the rest of the company, who wanted to hear the end. But when Polemarchus and I had done speaking and there was a pause, he could no longer hold his peace; and, gathering himself up, he came at us like a wild beast, seeking to devour us. We were quite panicstricken at the sight of him.

He roared out to the whole company: What folly, Socrates, has taken possession of you all? And why, sillybillies, do you knock under to one another? I say that if you want really to know what justice is, you should not only ask but answer, and you should not seek honor to yourself from the refutation of an opponent, but have your own answer; for there is many a one who can ask and cannot answer. And now I will not have you say that justice is duty or advantage or profit or gain or interest, for this sort of nonsense will not do for me; I must have clearness and accuracy.

I was panicstricken at his words, and could not look at him without trembling. Indeed I believe that if I had not fixed my eye upon him, I should have been struck dumb: but when I saw his fury rising, I looked at him first, and was therefore able to reply to him.

Thrasymachus, I said, with a quiver, don't be hard upon us. Polemarchus and I may have been guilty of a little mistake in the argument, but I can assure you that the error was not intentional. If we were seeking for a piece of gold, you would not imagine that we were "knocking under to one another," and so losing our chance of finding it. And why, when we are seeking for justice, a thing more precious than many pieces of gold, do you say that we are weakly yielding to one another and not doing our utmost to get at the truth? Nay, my good friend, we are most willing and anxious to do so, but the fact is that we cannot. And if so, you people who know all things should pity us and not be angry with us.

How characteristic of Socrates! he replied, with a bitter laugh; that's your ironical style! Did I not foresee -- have I not already told you, that whatever he was asked he would refuse to answer, and try irony or any other shuffle, in order that he might avoid answering?

You are a philosopher, Thrasymachus, I replied, and well know that if you ask a person what numbers make up twelve, taking care to prohibit him whom you ask from answering twice six, or three times four, or six times two, or four times three, "for this sort of nonsense will not do for me" -- then obviously, if that is your way of putting the question, no one can answer you. But suppose that he were to retort: "Thrasymachus, what do you mean? If one of these numbers which you interdict be the true answer to the question, am I falsely to say some other number which is not

the right one? -- is that your meaning?" -- How would you answer him?

Just as if the two cases were at all alike! he said.

Why should they not be? I replied; and even if they are not, but only appear to be so to the person who is asked, ought he not to say what he thinks, whether you and I forbid him or not?

I presume then that you are going to make one of the interdicted answers?

I dare say that I may, notwithstanding the danger, if upon reflection I approve of any of them.

But what if I give you an answer about justice other and better, he said, than any of these? What do you deserve to have done to you?

Done to me! -- as becomes the ignorant, I must learn from the wise -- that is what I deserve to have done to me.

What, and no payment! A pleasant notion!

I will pay when I have the money, I replied.

But you have, Socrates, said Glaucon: and you, Thrasymachus, need be under no anxiety about money, for we will all make a contribution for Socrates.

Yes, he replied, and then Socrates will do as he always does -- refuse to answer himself, but take and pull to pieces the answer of someone else.

Why, my good friend, I said, how can anyone answer who knows, and says that he knows, just nothing; and who, even if he has some faint notions of his own, is told by a man of authority not to utter them? The natural thing is, that the speaker should be someone like yourself who professes to know and can tell what he knows. Will you then kindly answer, for the edification of the company and of myself?

Glaucon and the rest of the company joined in my request, and Thrasymachus, as anyone might see, was in reality eager to speak; for he thought that he had an excellent answer, and would distinguish himself. But at first he affected to insist on my answering; at length he consented to begin. Behold, he said, the wisdom of Socrates; he refuses to teach himself, and goes about learning of others, to whom he never even says, Thank you.

That I learn of others, I replied, is quite true; but that I am ungrateful I wholly deny. Money I have none, and therefore I pay in praise, which is all I have; and how ready I am to praise anyone who appears to me to speak well you will very soon find out when you answer; for I expect that you will answer well.

Listen, then, he said; I proclaim that justice is nothing else than the interest of the stronger. And now why

do you not praise me? But of course you won't.

Let me first understand you, I replied. Justice, as you say, is the interest of the stronger. What, Thrasymachus, is the meaning of this? You cannot mean to say that because Polydamas, the pancratiast, is stronger than we are, and finds the eating of beef conducive to his bodily strength, that to eat beef is therefore equally for our good who are weaker than he is, and right and just for us?

That's abominable of you, Socrates; you take the words in the sense which is most damaging to the argument.

Not at all, my good sir, I said; I am trying to understand them; and I wish that you would be a little clearer.

Well, he said, have you never heard that forms of government differ -- there are tyrannies, and there are democracies, and there are aristocracies?

Yes, I know.

And the government is the ruling power in each State?

Certainly.

And the different forms of government make laws democratical, aristocratical, tyrannical, with a view to their several interests; and these laws, which are made by them for their own interests, are the justice which they deliver to their subjects, and him who transgresses them they punish as a breaker of the law, and unjust. And that is what I mean when I say that in all States there is the same principle of justice, which is the interest of the government; and as the government must be supposed to have power, the only reasonable conclusion is that everywhere there is one principle of justice, which is the interest of the stronger.

Now I understand you, I said; and whether you are right or not I will try to discover. But let me remark that in defining justice you have yourself used the word "interest," which you forbade me to use. It is true, however, that in your definition the words "of the stronger" are added.

A small addition, you must allow, he said.

Great or small, never mind about that: we must first inquire whether what you are saying is the truth. Now we are both agreed that justice is interest of some sort, but you go on to say "of the stronger"; about this addition I am not so sure, and must therefore consider further.

Proceed.

I will; and first tell me, Do you admit that it is just for subjects to obey their rulers?

I do.

But are the rulers of States absolutely infallible, or are they sometimes liable to err?

To be sure, he replied, they are liable to err?

Then in making their laws they may sometimes make them rightly, and sometimes not?

True.

When they make them rightly, they make them agreeably to their interest; when they are mistaken, contrary to their interest; you admit that?

Yes.

And the laws which they make must be obeyed by their subjects -- and that is what you call justice?

Doubtless.

Then justice, according to your argument, is not only obedience to the interest of the stronger, but the reverse?

What is that you are saying? he asked.

I am only repeating what you are saying, I believe. But let us consider: Have we not admitted that the rulers may be mistaken about their own interest in what they command, and also that to obey them is justice? Has not that been admitted?

Yes.

Then you must also have acknowledged justice not to be for the interest of the stronger, when the rulers unintentionally command things to be done which are to their own injury. For if, as you say, justice is the obedience which the subject renders to their commands, in that case, O wisest of men, is there any escape from the conclusion that the weaker are commanded to do, not what is for the interest, but what is for the injury of the stronger?

Nothing can be clearer, Socrates, said Polemarchus.

Yes, said Cleitophon, interposing, if you are allowed to be his witness.

But there is no need of any witness, said Polemarchus, for Thrasymachus himself acknowledges that rulers may sometime command what is not for their own interest, and that for subjects to obey them is justice.

Yes, Polemarchus -- Thrasymachus said that for subjects to do what was commanded by their rulers is just.

Yes, Cleitophon, but he also said that justice is the interest of the stronger, and, while admitting both these propositions, he further acknowledged that the stronger may command the weaker who are his subjects to do what is not for his own interest; whence follows that justice is the

injury quite as much as the interest of the stronger.

But, said Cleitophon, he meant by the interest of the stronger what the stronger thought to be his interest -- this was what the weaker had to do; and this was affirmed by him to be justice.

Those were not his words, rejoined Polemarchus.

Never mind, I replied, if he now says that they are, let us accept his statement. Tell me, Thrasymachus, I said, did you mean by justice what the stronger thought to be his interest, whether really so or not?

Certainly not, he said. Do you suppose that I call him who is mistaken the stronger at the time when he is mistaken?

Yes, I said, my impression was that you did so, when you admitted that the ruler was not infallible, but might be sometimes mistaken.

You argue like an informer, Socrates. Do you mean, for example, that he who is mistaken about the sick is a physician in that he is mistaken? or that he who errs in arithmetic or grammar is an arithmetician or grammarian at the time when he is making the mistake, in respect of the mistake? True, we say that the physician or arithmetician or grammarian has made a mistake, but this is only a way of speaking; for the fact is that neither the grammarian nor any other person of skill ever makes a mistake in so far as he is what his name implies; they none of them err unless their skill fails them, and then they cease to be skilled artists. No artist or sage or ruler errs at the time when he is what his name implies; though he is commonly said to err, and I adopted the common mode of speaking. But to be perfectly accurate, since you are such a lover of accuracy, we should say that the ruler, in so far as he is a ruler, is unerring, and, being unerring, always commands that which is for his own interest; and the subject is required to execute his commands; and therefore, as I said at first and now repeat, justice is the interest of the stronger.

Indeed, Thrasymachus, and do I really appear to you to argue like an informer?

Certainly, he replied.

And do you suppose that I ask these questions with any design of injuring you in the argument?

Nay, he replied, "suppose" is not the word -- I know it; but you will be found out, and by sheer force of argument you will never prevail.

I shall not make the attempt, my dear man; but to avoid any misunderstanding occurring between us in future, let me ask, in what sense do you speak of a ruler or stronger whose interest, as you were saying, he being the superior, it is just that the inferior should execute -- is he a ruler in the popular or in the strict sense of the term?

In the strictest of all senses, he said. And now cheat and play the informer if you can; I ask no quarter at your hands. But you never will be able, never.

And do you imagine, I said, that I am such a madman as to try and cheat Thrasymachus? I might as well shave a lion.

Why, he said, you made the attempt a minute ago, and you failed.

Enough, I said, of these civilities. It will be better that I should ask you a question: Is the physician, taken in that strict sense of which you are speaking, a healer of the sick or a maker of money? And remember that I am now speaking of the true physician.

A healer of the sick, he replied.

And the pilot -- that is to say, the true pilot -- is he a captain of sailors or a mere sailor?

A captain of sailors.

The circumstance that he sails in the ship is not to be taken into account; neither is he to be called a sailor; the name pilot by which he is distinguished has nothing to do with sailing, but is significant of his skill and of his authority over the sailors.

Very true, he said.

Now, I said, every art has an interest?

Certainly.

For which the art has to consider and provide?

Yes, that is the aim of art.

And the interest of any art is the perfection of it -- this and nothing else?

What do you mean?

I mean what I may illustrate negatively by the example of the body. Suppose you were to ask me whether the body is selfsufficing or has wants, I should reply: Certainly the body has wants; for the body may be ill and require to be cured, and has therefore interests to which the art of medicine ministers; and this is the origin and intention of medicine, as you will acknowledge. Am I not right?

Quite right, he replied.

But is the art of medicine or any other art faulty or deficient in any quality in the same way that the eye may be deficient in sight or the ear fail of hearing, and therefore requires another art to provide for the interests of seeing and hearing -- has art in itself, I say, any similar liability to fault or defect, and does every art require

another supplementary art to provide for its interests, and that another and another without end? Or have the arts to look only after their own interests? Or have they no need either of themselves or of another? -- having no faults or defects, they have no need to correct them, either by the exercise of their own art or of any other; they have only to consider the interest of their subjectmatter. For every art remains pure and faultless while remaining true -- that is to say, while perfect and unimpaired. Take the words in your precise sense, and tell me whether I am not right.

Yes, clearly.

Then medicine does not consider the interest of medicine, but the interest of the body?

True, he said.

Nor does the art of horsemanship consider the interests of the art of horsemanship, but the interests of the horse; neither do any other arts care for themselves, for they have no needs; they care only for that which is the subject of their art?

True, he said.

But surely, Thrasymachus, the arts are the superiors and rulers of their own subjects?

To this he assented with a good deal of reluctance.

Then, I said, no science or art considers or enjoins the interest of the stronger or superior, but only the interest of the subject and weaker?

He made an attempt to contest this proposition also, but finally acquiesced.

Then, I continued, no physician, in so far as he is a physician, considers his own good in what he prescribes, but the good of his patient; for the true physician is also a ruler having the human body as a subject, and is not a mere moneymaker; that has been admitted?

Yes.

And the pilot likewise, in the strict sense of the term, is a ruler of sailors, and not a mere sailor?

That has been admitted.

And such a pilot and ruler will provide and prescribe for the interest of the sailor who is under him, and not for his own or the ruler's interest?

He gave a reluctant "Yes."

Then, I said, Thrasymachus, there is no one in any rule who, in so far as he is a ruler, considers or enjoins what is for his own interest, but always what is for the interest of his subject or suitable to his art; to that he looks, and

that alone he considers in everything which he says and does.

When we had got to this point in the argument, and everyone saw that the definition of justice had been completely upset, Thrasymachus, instead of replying to me, said, Tell me, Socrates, have you got a nurse?

Why do you ask such a question, I said, when you ought rather to be answering?

Because she leaves you to snivel, and never wipes your nose: she has not even taught you to know the shepherd from the sheep.

What makes you say that? I replied.

Because you fancy that the shepherd or neatherd fattens or tends the sheep or oxen with a view to their own good and not to the good of himself or his master; and you further imagine that the rulers of States, if they are true rulers, never think of their subjects as sheep, and that they are not studying their own advantage day and night. Oh, no; and so entirely astray are you in your ideas about the just and unjust as not even to know that justice and the just are in reality another's good; that is to say, the interest of the ruler and stronger, and the loss of the subject and servant; and injustice the opposite; for the unjust is lord over the truly simple and just: he is the stronger, and his subjects do what is for his interest, and minister to his happiness, which is very far from being their own. Consider further, most foolish Socrates, that the just is always a loser in comparison with the unjust. First of all, in private contracts: wherever the unjust is the partner of the just you will find that, when the partnership is dissolved, the unjust man has always more and the just less. Secondly, in their dealings with the State: when there is an incometax, the just man will pay more and the unjust less on the same amount of income; and when there is anything to be received the one gains nothing and the other much. Observe also what happens when they take an office; there is the just man neglecting his affairs and perhaps suffering other losses, and getting nothing out of the public, because he is just; moreover he is hated by his friends and acquaintance for refusing to serve them in unlawful ways. But all this is reversed in the case of the unjust man. I am speaking, as before, of injustice on a large scale in which the advantage of the unjust is most apparent; and my meaning will be most clearly seen if we turn to that highest form of injustice in which the criminal is the happiest of men, and the sufferers or those who refuse to do injustice are the most miserable -- that is to say tyranny, which by fraud and force takes away the property of others, not little by little but wholesale; comprehending in one, things sacred as well as profane, private and public; for which acts of wrong, if he were detected perpetrating any one of them singly, he would be punished and incur great disgrace -- they who do such wrong in particular cases are called robbers of temples, and manstealers and burglars and swindlers and thieves. But when a man besides taking away the money of the citizens has made slaves of them, then, instead of these names of reproach, he

is termed happy and blessed, not only by the citizens but by all who hear of his having achieved the consummation of injustice. For mankind censure injustice, fearing that they may be the victims of it and not because they shrink from committing it. And thus, as I have shown, Socrates, injustice, when on a sufficient scale, has more strength and freedom and mastery than justice; and, as I said at first, justice is the interest of the stronger, whereas injustice is a man's own profit and interest.

Thrasymachus, when he had thus spoken, having, like a bathman, deluged our ears with his words, had a mind to go away. But the company would not let him; they insisted that he should remain and defend his position; and I myself added my own humble request that he would not leave us. Thrasymachus, I said to him, excellent man, how suggestive are your remarks! And are you going to run away before you have fairly taught or learned whether they are true or not? Is the attempt to determine the way of man's life so small a matter in your eyes -- to determine how life may be passed by each one of us to the greatest advantage?

And do I differ from you, he said, as to the importance of the inquiry?

You appear rather, I replied, to have no care or thought about us, Thrasymachus -- whether we live better or worse from not knowing what you say you know, is to you a matter of indifference. Prithee, friend, do not keep your knowledge to yourself; we are a large party; and any benefit which you confer upon us will be amply rewarded. For my own part I openly declare that I am not convinced, and that I do not believe injustice to be more gainful than justice, even if uncontrolled and allowed to have free play. For, granting that there may be an unjust man who is able to commit injustice either by fraud or force, still this does not convince me of the superior advantage of injustice, and there may be others who are in the same predicament with myself. Perhaps we may be wrong; if so, you in your wisdom should convince us that we are mistaken in preferring justice to injustice.

And how am I to convince you, he said, if you are not already convinced by what I have just said; what more can I do for you? Would you have me put the proof bodily into your souls?

Heaven forbid! I said; I would only ask you to be consistent; or, if you change, change openly and let there be no deception. For I must remark, Thrasymachus, if you will recall what was previously said, that although you began by defining the true physician in an exact sense, you did not observe a like exactness when speaking of the shepherd; you thought that the shepherd as a shepherd tends the sheep not with a view to their own good, but like a mere diner or banqueter with a view to the pleasures of the table; or, again, as a trader for sale in the market, and not as a shepherd. Yet surely the art of the shepherd is concerned only with the good of his subjects; he has only to provide the best for them, since the perfection of the art is already insured whenever all the requirements of it are

satisfied. And that was what I was saying just now about the ruler. I conceived that the art of the ruler, considered as a ruler, whether in a State or in private life, could only regard the good of his flock or subjects; whereas you seem to think that the rulers in States, that is to say, the true rulers, like being in authority.

Think! Nay, I am sure of it.

Then why in the case of lesser offices do men never take them willingly without payment, unless under the idea that they govern for the advantage not of themselves but of others? Let me ask you a question: Are not the several arts different, by reason of their each having a separate function? And, my dear illustrious friend, do say what you think, that we may make a little progress.

Yes, that is the difference, he replied.

And each art gives us a particular good and not merely a general one -- medicine, for example, gives us health; navigation, safety at sea, and so on?

Yes, he said.

And the art of payment has the special function of giving pay: but we do not confuse this with other arts, any more than the art of the pilot is to be confused with the art of medicine, because the health of the pilot may be improved by a sea voyage. You would not be inclined to say, would you? that navigation is the art of medicine, at least if we are to adopt your exact use of language?

Certainly not.

Or because a man is in good health when he receives pay you would not say that the art of payment is medicine?

I should not.

Nor would you say that medicine is the art of receiving pay because a man takes fees when he is engaged in healing?

Certainly not.

And we have admitted, I said, that the good of each art is specially confined to the art?

Yes.

Then, if there be any good which all artists have in common, that is to be attributed to something of which they all have the common use?

True, he replied.

And when the artist is benefited by receiving pay the advantage is gained by an additional use of the art of pay, which is not the art professed by him?

He gave a reluctant assent to this.

Then the pay is not derived by the several artists from their respective arts. But the truth is, that while the art of medicine gives health, and the art of the builder builds a house, another art attends them which is the art of pay. The various arts may be doing their own business and benefiting that over which they preside, but would the artist receive any benefit from his art unless he were paid as well?

I suppose not.

But does he therefore confer no benefit when he works for nothing?

Certainly, he confers a benefit.

Then now, Thrasymachus, there is no longer any doubt that neither arts nor governments provide for their own interests; but, as we were before saying, they rule and provide for the interests of their subjects who are the weaker and not the stronger -- to their good they attend and not to the good of the superior.

And this is the reason, my dear Thrasymachus, why, as I was just now saying, no one is willing to govern; because no one likes to take in hand the reformation of evils which are not his concern, without remuneration. For, in the execution of his work, and in giving his orders to another, the true artist does not regard his own interest, but always that of his subjects; and therefore in order that rulers may be willing to rule, they must be paid in one of three modes of payment, money, or honor, or a penalty for refusing.

What do you mean, Socrates? said Glaucon. The first two modes of payment are intelligible enough, but what the penalty is I do not understand, or how a penalty can be a payment.

You mean that you do not understand the nature of this payment which to the best men is the great inducement to rule? Of course you know that ambition and avarice are held to be, as indeed they are, a disgrace?

Very true.

And for this reason, I said, money and honor have no attraction for them; good men do not wish to be openly demanding payment for governing and so to get the name of hirelings, nor by secretly helping themselves out of the public revenues to get the name of thieves. And not being ambitious they do not care about honor. Wherefore necessity must be laid upon them, and they must be induced to serve from the fear of punishment. And this, as I imagine, is the reason why the forwardness to take office, instead of waiting to be compelled, has been deemed dishonorable. Now the worst part of the punishment is that he who refuses to rule is liable to be ruled by one who is worse than himself. And the fear of this, as I conceive, induces the good to take office, not because they would, but because they cannot help -- not under the idea that they are going to have any

benefit or enjoyment themselves, but as a necessity, and because they are not able to commit the task of ruling to anyone who is better than themselves, or indeed as good. For there is reason to think that if a city were composed entirely of good men, then to avoid office would be as much an object of contention as to obtain office is at present; then we should have plain proof that the true ruler is not meant by nature to regard his own interest, but that of his subjects; and everyone who knew this would choose rather to receive a benefit from another than to have the trouble of conferring one. So far am I from agreeing with Thrasymachus that justice is the interest of the stronger. This latter question need not be further discussed at present; but when Thrasymachus says that the life of the unjust is more advantageous than that of the just, his new statement appears to me to be of a far more serious character. Which of us has spoken truly? And which sort of life, Glaucon, do you prefer?

I for my part deem the life of the just to be the more advantageous, he answered.

Did you hear all the advantages of the unjust which Thrasymachus was rehearsing?

Yes, I heard him, he replied, but he has not convinced me.

Then shall we try to find some way of convincing him, if we can, that he is saying what is not true?

Most certainly, he replied.

If, I said, he makes a set speech and we make another recounting all the advantages of being just, and he answers and we rejoin, there must be a numbering and measuring of the goods which are claimed on either side, and in the end we shall want judges to decide; but if we proceed in our inquiry as we lately did, by making admissions to one another, we shall unite the offices of judge and advocate in our own persons.

Very good, he said.

And which method do I understand you to prefer? I said.

That which you propose.

Well, then, Thrasymachus, I said, suppose you begin at the beginning and answer me. You say that perfect injustice is more gainful than perfect justice?

Yes, that is what I say, and I have given you my reasons.

And what is your view about them? Would you call one of them virtue and the other vice?

Certainly.

I suppose that you would call justice virtue and

injustice vice?

What a charming notion! So likely too, seeing that I affirm injustice to be profitable and justice not.

What else then would you say?

The opposite, he replied.

And would you call justice vice?

No, I would rather say sublime simplicity.

Then would you call injustice malignity?

No; I would rather say discretion.

And do the unjust appear to you to be wise and good?

Yes, he said; at any rate those of them who are able to be perfectly unjust, and who have the power of subduing States and nations; but perhaps you imagine me to be talking of cutpurses.

Even this profession, if undetected, has advantages, though they are not to be compared with those of which I was just now speaking.

I do not think that I misapprehend your meaning, Thrasymachus, I replied; but still I cannot hear without amazement that you class injustice with wisdom and virtue, and justice with the opposite.

Certainly I do so class them.

Now, I said, you are on more substantial and almost unanswerable ground; for if the injustice which you were maintaining to be profitable had been admitted by you as by others to be vice and deformity, an answer might have been given to you on received principles; but now I perceive that you will call injustice honorable and strong, and to the unjust you will attribute all the qualities which were attributed by us before to the just, seeing that you do not hesitate to rank injustice with wisdom and virtue.

You have guessed most infallibly, he replied.

Then I certainly ought not to shrink from going through with the argument so long as I have reason to think that you, Thrasymachus, are speaking your real mind; for I do believe that you are now in earnest and are not amusing yourself at our expense.

I may be in earnest or not, but what is that to you? -- to refute the argument is your business.

Very true, I said; that is what I have to do: But will you be so good as answer yet one more question? Does the just man try to gain any advantage over the just?

Far otherwise; if he did he would not be the simple

amusing creature which he is.

And would he try to go beyond just action?

He would not.

And how would he regard the attempt to gain an advantage over the unjust; would that be considered by him as just or unjust?

He would think it just, and would try to gain the advantage; but he would not be able.

Whether he would or would not be able, I said, is not to the point. My question is only whether the just man, while refusing to have more than another just man, would wish and claim to have more than the unjust?

Yes, he would.

And what of the unjust -- does he claim to have more than the just man and to do more than is just?

Of course, he said, for he claims to have more than all men.

And the unjust man will strive and struggle to obtain more than the just man or action, in order that he may have more than all?

True.

We may put the matter thus, I said -- the just does not desire more than his like, but more than his unlike, whereas the unjust desires more than both his like and his unlike?

Nothing, he said, can be better than that statement.

And the unjust is good and wise, and the just is neither?

Good again, he said.

And is not the unjust like the wise and good, and the just unlike them?

Of course, he said, he who is of a certain nature, is like those who are of a certain nature; he who is not, not.

Each of them, I said, is such as his like is?

Certainly, he replied.

Very good, Thrasymachus, I said; and now to take the case of the arts: you would admit that one man is a musician and another not a musician?

Yes.

And which is wise and which is foolish?

Clearly the musician is wise, and he who is not a musician is foolish.

And he is good in as far as he is wise, and bad in as far as he is foolish?

Yes.

And you would say the same sort of thing of the physician?

Yes.

And do you think, my excellent friend, that a musician when he adjusts the lyre would desire or claim to exceed or go beyond a musician in the tightening and loosening the strings?

I do not think that he would.

But he would claim to exceed the nonmusician?

Of course.

And what would you say of the physician? In prescribing meats and drinks would he wish to go beyond another physician or beyond the practice of medicine?

He would not.

But he would wish to go beyond the nonphysician?

Yes.

And about knowledge and ignorance in general; see whether you think that any man who has knowledge ever would wish to have the choice of saying or doing more than another man who has knowledge. Would he not rather say or do the same as his like in the same case?

That, I suppose, can hardly be denied.

And what of the ignorant? would he not desire to have more than either the knowing or the ignorant?

I dare say.

And the knowing is wise?

Yes.

And the wise is good?

True.

Then the wise and good will not desire to gain more than his like, but more than his unlike and opposite?

I suppose so.

Whereas the bad and ignorant will desire to gain more

than both?

Yes.

But did we not say, Thrasymachus, that the unjust goes beyond both his like and unlike? Were not these your words?

They were.

And you also said that the just will not go beyond his like, but his unlike?

Yes.

Then the just is like the wise and good, and the unjust like the evil and ignorant?

That is the inference.

And each of them is such as his like is?

That was admitted.

Then the just has turned out to be wise and good, and the unjust evil and ignorant.

Thrasymachus made all these admissions, not fluently, as I repeat them, but with extreme reluctance; it was a hot summer's day, and the perspiration poured from him in torrents; and then I saw what I had never seen before, Thrasymachus blushing. As we were now agreed that justice was virtue and wisdom, and injustice vice and ignorance, I proceeded to another point:

Well, I said, Thrasymachus, that matter is now settled; but were we not also saying that injustice had strength -- do you remember?

Yes, I remember, he said, but do not suppose that I approve of what you are saying or have no answer; if, however, I were to answer, you would be quite certain to accuse me of haranguing; therefore either permit me to have my say out, or if you would rather ask, do so, and I will answer "Very good," as they say to storytelling old women, and will nod "Yes" and "No."

Certainly not, I said, if contrary to your real opinion.

Yes, he said, I will, to please you, since you will not let me speak. What else would you have?

Nothing in the world, I said; and if you are so disposed I will ask and you shall answer.

Proceed.

Then I will repeat the question which I asked before, in order that our examination of the relative nature of justice and injustice may be carried on regularly. A statement was made that injustice is stronger and more

powerful than justice, but now justice, having been identified with wisdom and virtue, is easily shown to be stronger than injustice, if injustice is ignorance; this can no longer be questioned by anyone. But I want to view the matter, Thrasymachus, in a different way: You would not deny that a State may be unjust and may be unjustly attempting to enslave other States, or may have already enslaved them, and may be holding many of them in subjection?

True, he replied; and I will add that the best and most perfectly unjust State will be most likely to do so.

I know, I said, that such was your position; but what I would further consider is, whether this power which is possessed by the superior State can exist or be exercised without justice or only with justice.

If you are right in your view, and justice is wisdom, then only with justice; but if I am right, then without justice.

I am delighted, Thrasymachus, to see you not only nodding assent and dissent, but making answers which are quite excellent.

That is out of civility to you, he replied.

You are very kind, I said; and would you have the goodness also to inform me, whether you think that a State, or an army, or a band of robbers and thieves, or any other gang of evildoers could act at all if they injured one another? No, indeed, he said, they could not.

But if they abstained from injuring one another, then they might act together better?

Yes.

And this is because injustice creates divisions and hatreds and fighting, and justice imparts harmony and friendship; is not that true, Thrasymachus?

I agree, he said, because I do not wish to quarrel with you.

How good of you, I said; but I should like to know also whether injustice, having this tendency to arouse hatred, wherever existing, among slaves or among freemen, will not make them hate one another and set them at variance and render them incapable of common action?

Certainly.

And even if injustice be found in two only, will they not quarrel and fight, and become enemies to one another and to the just?

They will.

And suppose injustice abiding in a single person, would your wisdom say that she loses or that she retains her

natural power?

Let us assume that she retains her power.

Yet is not the power which injustice exercises of such a nature that wherever she takes up her abode, whether in a city, in an army, in a family, or in any other body, that body is, to begin with, rendered incapable of united action by reason of sedition and distraction? and does it not become its own enemy and at variance with all that opposes it, and with the just? Is not this the case?

Yes, certainly.

And is not injustice equally fatal when existing in a single person -- in the first place rendering him incapable of action because he is not at unity with himself, and in the second place making him an enemy to himself and the just? Is not that true, Thrasymachus?

Yes. And, O my friend, I said, surely the gods are just?

Granted that they are. But, if so, the unjust will be the enemy of the gods, and the just will be their friends?

Feast away in triumph, and take your fill of the argument; I will not oppose you, lest I should displease the company. Well, then, proceed with your answers, and let me have the remainder of my repast. For we have already shown that the just are clearly wiser and better and abler than the unjust, and that the unjust are incapable of common action; nay, more, that to speak as we did of men who are evil acting at any time vigorously together, is not strictly true, for, if they had been perfectly evil, they would have laid hands upon one another; but it is evident that there must have been some remnant of justice in them, which enabled them to combine; if there had not been they would have injured one another as well as their victims; they were but halfvillains in their enterprises; for had they been whole villains, and utterly unjust, they would have been utterly incapable of action. That, as I believe, is the truth of the matter, and not what you said at first. But whether the just have a better and happier life than the unjust is a further question which we also proposed to consider. I think that they have, and for the reasons which I have given; but still I should like to examine further, for no light matter is at stake, nothing less than the rule of human life.

Proceed.

I will proceed by asking a question: Would you not say that a horse has some end?

I should.

And the end or use of a horse or of anything would be that which could not be accomplished, or not so well accomplished, by any other thing?

I do not understand, he said.

Let me explain: Can you see, except with the eye?

Certainly not.

Or hear, except with the ear?

No. These, then, may be truly said to be the ends of these organs?

They may.

But you can cut off a vinebranch with a dagger or with a chisel, and in many other ways?

Of course.

And yet not so well as with a pruninghook made for the purpose?

True.

May we not say that this is the end of a pruninghook?

We may.

Then now I think you will have no difficulty in understanding my meaning when I asked the question whether the end of anything would be that which could not be accomplished, or not so well accomplished, by any other thing?

I understand your meaning, he said, and assent.

And that to which an end is appointed has also an excellence? Need I ask again whether the eye has an end?

It has.

And has not the eye an excellence?

Yes.

And the ear has an end and an excellence also?

True.

And the same is true of all other things; they have each of them an end and a special excellence?

That is so.

Well, and can the eyes fulfil their end if they are wanting in their own proper excellence and have a defect instead?

How can they, he said, if they are blind and cannot see?

You mean to say, if they have lost their proper

excellence, which is sight; but I have not arrived at that point yet. I would rather ask the question more generally, and only inquire whether the things which fulfil their ends fulfil them by their own proper excellence, and fail of fulfilling them by their own defect?

Certainly, he replied.

I might say the same of the ears; when deprived of their own proper excellence they cannot fulfil their end?

True.

And the same observation will apply to all other things?

I agree.

Well; and has not the soul an end which nothing else can fulfil? for example, to superintend and command and deliberate and the like. Are not these functions proper to the soul, and can they rightly be assigned to any other?

To no other.

And is not life to be reckoned among the ends of the soul?

Assuredly, he said.

And has not the soul an excellence also?

Yes.

And can she or can she not fulfil her own ends when deprived of that excellence?

She cannot.

Then an evil soul must necessarily be an evil ruler and superintendent, and the good soul a good ruler?

Yes, necessarily.

And we have admitted that justice is the excellence of the soul, and injustice the defect of the soul?

That has been admitted.

Then the just soul and the just man will live well, and the unjust man will live ill?

That is what your argument proves.

And he who lives well is blessed and happy, and he who lives ill the reverse of happy?

Certainly.

Then the just is happy, and the unjust miserable?

So be it.

But happiness, and not misery, is profitable?

Of course.

Then, my blessed Thrasymachus, injustice can never be more profitable than justice.

Let this, Socrates, he said, be your entertainment at the Bendidea.

For which I am indebted to you, I said, now that you have grown gentle toward me and have left off scolding. Nevertheless, I have not been well entertained; but that was my own fault and not yours. As an epicure snatches a taste of every dish which is successively brought to table, he not having allowed himself time to enjoy the one before, so have I gone from one subject to another without having discovered what I sought at first, the nature of justice. I left that inquiry and turned away to consider whether justice is virtue and wisdom, or evil and folly; and when there arose a further question about the comparative advantages of justice and injustice, I could not refrain from passing on to that. And the result of the whole discussion has been that I know nothing at all. For I know not what justice is, and therefore I am not likely to know whether it is or is not a virtue, nor can I say whether the just man is happy or unhappy.

* * * *

Book II: The Individual, The State, And Education

(Socrates, Glaucon.)

WITH these words I was thinking that I had made an end of the discussion; but the end, in truth, proved to be only a beginning. For Glaucon, who is always the most pugnacious of men, was dissatisfied at Thrasymachus's retirement; he wanted to have the battle out. So he said to me: Socrates, do you wish really to persuade us, or only to seem to have persuaded us, that to be just is always better than to be unjust?

I should wish really to persuade you, I replied, if I could.

Then you certainly have not succeeded. Let me ask you now: How would you arrange goods -- are there not some which we welcome for their own sakes, and independently of their consequences, as, for example, harmless pleasures and enjoyments, which delight us at the time, although nothing follows from them?

I agree in thinking that there is such a class, I replied.

Is there not also a second class of goods, such as knowledge, sight, health, which are desirable not only in themselves, but also for their results?

Certainly, I said.

And would you not recognize a third class, such as gymnastic, and the care of the sick, and the physician's art; also the various ways of moneymaking -- these do us good but we regard them as disagreeable; and no one would choose them for their own sakes, but only for the sake of some reward or result which flows from them?

There is, I said, this third class also. But why do you ask?

Because I want to know in which of the three classes you would place justice?

In the highest class, I replied -- among those goods which he who would be happy desires both for their own sake and for the sake of their results.

Then the many are of another mind; they think that justice is to be reckoned in the troublesome class, among goods which are to be pursued for the sake of rewards and of reputation, but in themselves are disagreeable and rather to be avoided.

I know, I said, that this is their manner of thinking, and that this was the thesis which Thrasymachus was maintaining just now, when he censured justice and praised injustice. But I am too stupid to be convinced by him.

I wish, he said, that you would hear me as well as him, and then I shall see whether you and I agree. For Thrasymachus seems to me, like a snake, to have been charmed by your voice sooner than he ought to have been; but to my mind the nature of justice and injustice has not yet been made clear. Setting aside their rewards and results, I want to know what they are in themselves, and how they inwardly work in the soul. If you please, then, I will revive the argument of Thrasymachus. And first I will speak of the nature and origin of justice according to the common view of them. Secondly, I will show that all men who practise justice do so against their will, of necessity, but not as a good. And thirdly, I will argue that there is reason in this view, for the life of the unjust is after all better far than the life of the just -- if what they say is true, Socrates, since I myself am not of their opinion. But still I acknowledge that I am perplexed when I hear the voices of Thrasymachus and myriads of others dinning in my ears; and, on the other hand, I have never yet heard the superiority of justice to injustice maintained by anyone in a satisfactory way. I want to hear justice praised in respect of itself; then I shall be satisfied, and you are the person from whom I think that I am most likely to hear this; and therefore I will praise the unjust life to the utmost of my power, and my manner of speaking will indicate the manner in which I desire to hear you too praising justice and censuring injustice. Will you say whether you approve of my proposal?

Indeed I do; nor can I imagine any theme about which a man of sense would oftener wish to converse.

I am delighted, he replied, to hear you say so, and shall begin by speaking, as I proposed, of the nature and origin of justice.

They say that to do injustice is, by nature, good; to suffer injustice, evil; but that the evil is greater than the good. And so when men have both done and suffered injustice and have had experience of both, not being able to avoid the one and obtain the other, they think that they had better agree among themselves to have neither; hence there arise laws and mutual covenants; and that which is ordained by law is termed by them lawful and just. This they affirm to be the origin and nature of justice; it is a mean or compromise, between the best of all, which is to do injustice and not be punished, and the worst of all, which is to suffer injustice without the power of retaliation; and justice, being at a middle point between the two, is tolerated not as a good, but as the lesser evil, and honored by reason of the inability of men to do injustice. For no man who is worthy to be called a man would ever submit to such an agreement if he were able to resist; he would be mad if he did. Such is the received account, Socrates, of the nature and origin of justice.

Now that those who practise justice do so involuntarily and because they have not the power to be unjust will best appear if we imagine something of this kind: having given both to the just and the unjust power to do what they will, let us watch and see whither desire will lead them; then we shall discover in the very act the just and unjust man to be proceeding along the same road, following their interest, which all natures deem to be their good, and are only diverted into the path of justice by the force of law. The liberty which we are supposing may be most completely given to them in the form of such a power as is said to have been possessed by Gyges, the ancestor of Croesus the Lydian. According to the tradition, Gyges was a shepherd in the service of the King of Lydia; there was a great storm, and an earthquake made an opening in the earth at the place where he was feeding his flock. Amazed at the sight, he descended into the opening, where, among other marvels, he beheld a hollow brazen horse, having doors, at which he, stooping and looking in, saw a dead body of stature, as appeared to him, more than human and having nothing on but a gold ring; this he took from the finger of the dead and reascended. Now the shepherds met together, according to custom, that they might send their monthly report about the flocks to the King; into their assembly he came having the ring on his finger, and as he was sitting among them he chanced to turn the collet of the ring inside his hand, when instantly he became invisible to the rest of the company and they began to speak of him as if he were no longer present. He was astonished at this, and again touching the ring he turned the collet outward and reappeared; he made several trials of the ring, and always with the same result -- when he turned the collet inward he became invisible, when outward he reappeared. Whereupon he contrived to be chosen one of the messengers who were sent to the court; where as soon as he arrived he seduced the Queen, and with her help conspired against the King and slew him and took the

kingdom. Suppose now that there were two such magic rings, and the just put on one of them and the unjust the other; no man can be imagined to be of such an iron nature that he would stand fast in justice. No man would keep his hands off what was not his own when he could safely take what he liked out of the market, or go into houses and lie with anyone at his pleasure, or kill or release from prison whom he would, and in all respects be like a god among men. Then the actions of the just would be as the actions of the unjust; they would both come at last to the same point. And this we may truly affirm to be a great proof that a man is just, not willingly or because he thinks that justice is any good to him individually, but of necessity, for wherever anyone thinks that he can safely be unjust, there he is unjust. For all men believe in their hearts that injustice is far more profitable to the individual than justice, and he who argues as I have been supposing, will say that they are right. If you could imagine anyone obtaining this power of becoming invisible, and never doing any wrong or touching what was another's, he would be thought by the lookerson to be a most wretched idiot, although they would praise him to one another's faces, and keep up appearances with one another from a fear that they too might suffer injustice. Enough of this.

Now, if we are to form a real judgment of the life of the just and unjust, we must isolate them; there is no other way; and how is the isolation to be effected? I answer: Let the unjust man be entirely unjust, and the just man entirely just; nothing is to be taken away from either of them, and both are to be perfectly furnished for the work of their respective lives. First, let the unjust be like other distinguished masters of craft; like the skilful pilot or physician, who knows intuitively his own powers and keeps within their limits, and who, if he fails at any point, is able to recover himself. So let the unjust make his unjust attempts in the right way, and lie hidden if he means to be great in his injustice (he who is found out is nobody): for the highest reach of injustice is, to be deemed just when you are not. Therefore I say that in the perfectly unjust man we must assume the most perfect injustice; there is to be no deduction, but we must allow him, while doing the most unjust acts, to have acquired the greatest reputation for justice. If he have taken a false step he must be able to recover himself; he must be one who can speak with effect, if any of his deeds come to light, and who can force his way where force is required by his courage and strength, and command of money and friends. And at his side let us place the just man in his nobleness and simplicity, wishing, as AEschylus says, to be and not to seem good. There must be no seeming, for if he seem to be just he will be honored and rewarded, and then we shall not know whether he is just for the sake of justice or for the sake of honor and rewards; therefore, let him be clothed in justice only, and have no other covering; and he must be imagined in a state of life the opposite of the former. Let him be the best of men, and let him be thought the worst; then he will have been put to the proof; and we shall see whether he will be affected by the fear of infamy and its consequences. And let him continue thus to the hour of death; being just and seeming to be unjust. When both have reached the uttermost extreme,

the one of justice and the other of injustice, let judgment be given which of them is the happier of the two.

Heavens! my dear Glaucon, I said, how energetically you polish them up for the decision, first one and then the other, as if they were two statues.

I do my best, he said. And now that we know what they are like there is no difficulty in tracing out the sort of life which awaits either of them. This I will proceed to describe; but as you may think the description a little too coarse, I ask you to suppose, Socrates, that the words which follow are not mine. Let me put them into the mouths of the eulogists of injustice: They will tell you that the just man who is thought unjust will be scourged, racked, bound -- will have his eyes burnt out; and, at last, after suffering every kind of evil, he will be impaled. Then he will understand that he ought to seem only, and not to be, just; the words of AEschylus may be more truly spoken of the unjust than of the just. For the unjust is pursuing a reality; he does not live with a view to appearances -- he wants to be really unjust and not to seem only --

"His mind has a soil deep and fertile, Out of which spring his prudent counsels."

In the first place, he is thought just, and therefore bears rule in the city; he can marry whom he will, and give in marriage to whom he will; also he can trade and deal where he likes, and always to his own advantage, because he has no misgivings about injustice; and at every contest, whether in public or private, he gets the better of his antagonists, and gains at their expense, and is rich, and out of his gains he can benefit his friends, and harm his enemies; moreover, he can offer sacrifices, and dedicate gifts to the gods abundantly and magnificently, and can honor the gods or any man whom he wants to honor in a far better style than the just, and therefore he is likely to be dearer than they are to the gods. And thus, Socrates, gods and men are said to unite in making the life of the unjust better than the life of the just.

I was going to say something in answer to Glaucon, when Adeimantus, his brother, interposed: Socrates, he said, you do not suppose that there is nothing more to be urged?

Why, what else is there? I answered.

The strongest point of all has not been even mentioned, he replied.

Well, then, according to the proverb, "Let brother help brother" -- if he fails in any part, do you assist him; although I must confess that Glaucon has already said quite enough to lay me in the dust, and take from me the power of helping justice.

Nonsense, he replied. But let me add something more: There is another side to Glaucon's argument about the praise and censure of justice and injustice, which is equally required in order to bring out what I believe to be his

meaning. Parents and tutors are always telling their sons and their wards that they are to be just; but why? not for the sake of justice, but for the sake of character and reputation; in the hope of obtaining for him who is reputed just some of those offices, marriages, and the like which Glaucon has enumerated among the advantages accruing to the unjust from the reputation of justice. More, however, is made of appearances by this class of persons than by the others; for they throw in the good opinion of the gods, and will tell you of a shower of benefits which the heavens, as they say, rain upon the pious; and this accords with the testimony of the noble Hesiod and Homer, the first of whom says that the gods make the oaks of the just --

"To bear acorns at their summit, and bees in the middle; And the sheep are bowed down with the weight of their fleeces,"

and many other blessings of a like kind are provided for them. And Homer has a very similar strain; for he speaks of one whose fame is

"As the fame of some blameless king who, like a god, Maintains justice; to whom the black earth brings forth Wheat and barley, whose trees are bowed with fruit, And his sheep never fail to bear, and the sea gives him fish."

Still grander are the gifts of heaven which Musaeus and his son vouchsafe to the just; they take them down into the world below, where they have the saints lying on couches at a feast, everlastingly drunk, crowned with garlands; their idea seems to be that an immortality of drunkenness is the highest meed of virtue. Some extend their rewards yet further; the posterity, as they say, of the faithful and just shall survive to the third and fourth generation. This is the style in which they praise justice. But about the wicked there is another strain; they bury them in a slough in Hades, and make them carry water in a sieve; also while they are yet living they bring them to infamy, and inflict upon them the punishments which Glaucon described as the portion of the just who are reputed to be unjust; nothing else does their invention supply. Such is their manner of praising the one and censuring the other.

Once more, Socrates, I will ask you to consider another way of speaking about justice and injustice, which is not confined to the poets, but is found in prose writers. The universal voice of mankind is always declaring that justice and virtue are honorable, but grievous and toilsome; and that the pleasures of vice and injustice are easy of attainment, and are only censured by law and opinion. They say also that honesty is for the most part less profitable than dishonesty; and they are quite ready to call wicked men happy, and to honor them both in public and private when they are rich or in any other way influential, while they despise and overlook those who may be weak and poor, even though acknowledging them to be better than the others. But most extraordinary of all is their mode of speaking about virtue and the gods: they say that the gods apportion calamity and misery to many good men, and good and happiness to the wicked. And mendicant prophets go to rich men's doors

and persuade them that they have a power committed to them by the gods of making an atonement for a man's own or his ancestor's sins by sacrifices or charms, with rejoicings and feasts; and they promise to harm an enemy, whether just or unjust, at a small cost; with magic arts and incantations binding heaven, as they say, to execute their will. And the poets are the authorities to whom they appeal, now smoothing the path of vice with the words of Hesiod:

"Vice may be had in abundance without trouble; the way is smooth and her dwellingplace is near. But before virtue the gods have set toil,"

and a tedious and uphill road: then citing Homer as a witness that the gods may be influenced by men; for he also says:

"The gods, too, may be turned from their purpose; and men pray to them and avert their wrath by sacrifices and soothing entreaties, and by libations and the odor of fat, when they have sinned and trangressed."

And they produce a host of books written by Musaeus and Orpheus, who were children of the Moon and the muses -- that is what they say -- according to which they perform their ritual, and persuade not only individuals, but whole cities, that expiations and atonements for sin may be made by sacrifices and amusements which fill a vacant hour, and are equally at the service of the living and the dead; the latter sort they call mysteries, and they redeem us from the pains of hell, but if we neglect them no one knows what awaits us.

He proceeded: And now when the young hear all this said about virtue and vice, and the way in which gods and men regard them, how are their minds likely to be affected, my dear Socrates -- those of them, I mean, who are quickwitted, and, like bees on the wing, light on every flower, and from all that they hear are prone to draw conclusions as to what manner of persons they should be and in what way they should walk if they would make the best of life? Probably the youth will say to himself in the words of Pindar:

"Can I by justice or by crooked ways of deceit ascend a loftier tower which may be a fortress to me all my days?"

For what men say is that, if I am really just and am not also thought just, profit there is none, but the pain and loss on the other hand are unmistakable. But if, though unjust, I acquire the reputation of justice, a heavenly life is promised to me. Since then, as philosophers prove, appearance tyrannizes over truth and is lord of happiness, to appearance I must devote myself. I will describe around me a picture and shadow of virtue to be the vestibule and exterior of my house; behind I will trail the subtle and crafty fox, as Archilochus, greatest of sages, recommends. But I hear someone exclaiming that the concealment of wickedness is often difficult; to which I answer, Nothing great is easy. Nevertheless, the argument indicates this, if we would be happy, to be the path along which we should proceed. With a view to concealment we will establish secret

brotherhoods and political clubs. And there are professors of rhetoric who teach the art of persuading courts and assemblies; and so, partly by persuasion and partly by force, I shall make unlawful gains and not be punished. Still I hear a voice saying that the gods cannot be deceived, neither can they be compelled. But what if there are no gods? or, suppose them to have no care of human things -- why in either case should we mind about concealment? And even if there are gods, and they do care about us, yet we know of them only from tradition and the genealogies of the poets; and these are the very persons who say that they may be influenced and turned by "sacrifices and soothing entreaties and by offerings." Let us be consistent, then, and believe both or neither. If the poets speak truly, why, then, we had better be unjust, and offer of the fruits of injustice; for if we are just, although we may escape the vengeance of heaven, we shall lose the gains of injustice; but, if we are unjust, we shall keep the gains, and by our sinning and praying, and praying and sinning, the gods will be propitiated, and we shall not be punished. "But there is a world below in which either we or our posterity will suffer for our unjust deeds." Yes, my friend, will be the reflection, but there are mysteries and atoning deities, and these have great power. That is what mighty cities declare; and the children of the gods, who were their poets and prophets, bear a like testimony.

On what principle, then, shall we any longer choose justice rather than the worst injustice? when, if we only unite the latter with a deceitful regard to appearances, we shall fare to our mind both with gods and men, in life and after death, as the most numerous and the highest authorities tell us. Knowing all this, Socrates, how can a man who has any superiority of mind or person or rank or wealth, be willing to honor justice; or indeed to refrain from laughing when he hears justice praised? And even if there should be someone who is able to disprove the truth of my words, and who is satisfied that justice is best, still he is not angry with the unjust, but is very ready to forgive them, because he also knows that men are not just of their own free will; unless, peradventure, there be someone whom the divinity within him may have inspired with a hatred of injustice, or who has attained knowledge of the truth -- but no other man. He only blames injustice, who, owing to cowardice or age or some weakness, has not the power of being unjust. And this is proved by the fact that when he obtains the power, he immediately becomes unjust as far as he can be.

The cause of all this, Socrates, was indicated by us at the beginning of the argument, when my brother and I told you how astonished we were to find that of all the professing panegyrists of justice -- beginning with the ancient heroes of whom any memorial has been preserved to us, and ending with the men of our own time -- no one has ever blamed injustice or praised justice except with a view to the glories, honors, and benefits which flow from them. No one has ever adequately described either in verse or prose the true essential nature of either of them abiding in the soul, and invisible to any human or divine eye; or shown that of all the things of a man's soul which he has within

him, justice is the greatest good, and injustice the greatest evil. Had this been the universal strain, had you sought to persuade us of this from our youth upward, we should not have been on the watch to keep one another from doing wrong, but everyone would have been his own watchman, because afraid, if he did wrong, of harboring in himself the greatest of evils. I dare say that Thrasymachus and others would seriously hold the language which I have been merely repeating, and words even stronger than these about justice and injustice, grossly, as I conceive, perverting their true nature. But I speak in this vehement manner, as I must frankly confess to you, because I want to hear from you the opposite side; and I would ask you to show not only the superiority which justice has over injustice, but what effect they have on the possessor of them which makes the one to be a good and the other an evil to him. And please, as Glaucon requested of you, to exclude reputations; for unless you take away from each of them his true reputation and add on the false, we shall say that you do not praise justice, but the appearance of it; we shall think that you are only exhorting us to keep injustice dark, and that you really agree with Thrasymachus in thinking that justice is another's good and the interest of the stronger, and that injustice is a man's own profit and interest, though injurious to the weaker. Now as you have admitted that justice is one of that highest class of goods which are desired, indeed, for their results, but in a far greater degree for their own sakes -- like sight or hearing or knowledge or health, or any other real and natural and not merely conventional good -- I would ask you in your praise of justice to regard one point only: I mean the essential good and evil which justice and injustice work in the possessors of them. Let others praise justice and censure injustice, magnifying the rewards and honors of the one and abusing the other; that is a manner of arguing which, coming from them, I am ready to tolerate, but from you who have spent your whole life in the consideration of this question, unless I hear the contrary from your own lips, I expect something better. And therefore, I say, not only prove to us that justice is better than injustice, but show what they either of them do to the possessor of them, which makes the one to be a good and the other an evil, whether seen or unseen by gods and men.

I had always admired the genius of Glaucon and Adeimantus, but on hearing these words I was quite delighted, and said: Sons of an illustrious father, that was not a bad beginning of the elegiac verses which the admirer of Glaucon made in honor of you after you had distinguished yourselves at the battle of Megara:

"Sons of Ariston," he sang, "divine offspring of an illustrious hero."

The epithet is very appropriate, for there is something truly divine in being able to argue as you have done for the superiority of injustice, and remaining unconvinced by your own arguments. And I do believe that you are not convinced -- this I infer from your general character, for had I judged only from your speeches I should have mistrusted you. But now, the greater my confidence in you, the greater is my

difficulty in knowing what to say. For I am in a strait between two; on the one hand I feel that I am unequal to the task; and my inability is brought home to me by the fact that you were not satisfied with the answer which I made to Thrasymachus, proving, as I thought, the superiority which justice has over injustice. And yet I cannot refuse to help, while breath and speech remain to me; I am afraid that there would be an impiety in being present when justice is evil spoken of and not lifting up a hand in her defence. And therefore I had best give such help as I can.

Glaucon and the rest entreated me by all means not to let the question drop, but to proceed in the investigation. They wanted to arrive at the truth, first, about the nature of justice and injustice, and secondly, about their relative advantages. I told them, what I really thought, that the inquiry would be of a serious nature, and would require very good eyes. Seeing then, I said, that we are no great wits, I think that we had better adopt a method which I may illustrate thus; suppose that a shortsighted person had been asked by someone to read small letters from a distance; and it occurred to someone else that they might be found in another place which was larger and in which the letters were larger -- if they were the same and he could read the larger letters first, and then proceed to the lesser -- this would have been thought a rare piece of goodfortune.

Very true, said Adeimantus; but how does the illustration apply to our inquiry?

I will tell you, I replied; justice, which is the subject of our inquiry, is, as you know, sometimes spoken of as the virtue of an individual, and sometimes as the virtue of a State.

True, he replied.

And is not a State larger than an individual?

It is.

Then in the larger the quantity of justice is likely to be larger and more easily discernible. I propose therefore that we inquire into the nature of justice and injustice, first as they appear in the State, and secondly in the individual, proceeding from the greater to the lesser and comparing them.

That, he said, is an excellent proposal.

And if we imagine the State in process of creation, we shall see the justice and injustice of the State in process of creation also.

I dare say.

When the State is completed there may be a hope that the object of our search will be more easily discovered.

Yes, far more easily.

But ought we to attempt to construct one? I said; for to do so, as I am inclined to think, will be a very serious task. Reflect therefore.

I have reflected, said Adeimantus, and am anxious that you should proceed.

A State, I said, arises, as I conceive, out of the needs of mankind; no one is selfsufficing, but all of us have many wants. Can any other origin of a State be imagined?

There can be no other.

Then, as we have many wants, and many persons are needed to supply them, one takes a helper for one purpose and another for another; and when these partners and helpers are gathered together in one habitation the body of inhabitants is termed a State.

True, he said.

And they exchange with one another, and one gives, and another receives, under the idea that the exchange will be for their good.

Very true.

Then, I said, let us begin and create in idea a State; and yet the true creator is necessity, who is the mother of our invention.

Of course, he replied.

Now the first and greatest of necessities is food, which is the condition of life and existence.

Certainly.

The second is a dwelling, and the third clothing and the like.

True.

And now let us see how our city will be able to supply this great demand: We may suppose that one man is a husbandman, another a builder, someone else a weaver -- shall we add to them a shoemaker, or perhaps some other purveyor to our bodily wants?

Quite right.

The barest notion of a State must include four or five men.

Clearly.

And how will they proceed? Will each bring the result of his labors into a common stock? -- the individual husbandman, for example, producing for four, and laboring four times as long and as much as he need in the provision

of food with which he supplies others as well as himself; or will he have nothing to do with others and not be at the trouble of producing for them, but provide for himself alone a fourth of the food in a fourth of the time, and in the remaining threefourths of his time be employed in making a house or a coat or a pair of shoes, having no partnership with others, but supplying himself all his own wants?

Adeimantus thought that he should aim at producing food only and not at producing everything.

Probably, I replied, that would be the better way; and when I hear you say this, I am myself reminded that we are not all alike; there are diversities of natures among us which are adapted to different occupations.

Very true.

And will you have a work better done when the workman has many occupations, or when he has only one?

When he has only one.

Further, there can be no doubt that a work is spoilt when not done at the right time?

No doubt.

For business is not disposed to wait until the doer of the business is at leisure; but the doer must follow up what he is doing, and make the business his first object.

He must.

And if so, we must infer that all things are produced more plentifully and easily and of a better quality when one man does one thing which is natural to him and does it at the right time, and leaves other things. Undoubtedly.

Then more than four citizens will be required; for the husbandman will not make his own plough or mattock, or other implements of agriculture, if they are to be good for anything. Neither will the builder make his tools -- and he, too, needs many; and in like manner the weaver and shoemaker.

True.

Then carpenters and smiths and many other artisans will be sharers in our little State, which is already beginning to grow?

True.

Yet even if we add neatherds, shepherds, and other herdsmen, in order that our husbandmen may have oxen to plough with, and builders as well as husbandmen may have draught cattle, and curriers and weavers fleeces and hides -- still our State will not be very large.

That is true; yet neither will it be a very small State

which contains all these.

Then, again, there is the situation of the city -- to find a place where nothing need be imported is wellnigh impossible.

Impossible.

Then there must be another class of citizens who will bring the required supply from another city?

There must.

But if the trader goes emptyhanded, having nothing which they require who would supply his need, he will come back emptyhanded.

That is certain.

And therefore what they produce at home must be not only enough for themselves, but such both in quantity and quality as to accommodate those from whom their wants are supplied.

Very true.

Then more husbandmen and more artisans will be required?

They will.

Not to mention the importers and exporters, who are called merchants?

Yes.

Then we shall want merchants?

We shall.

And if merchandise is to be carried over the sea, skilful sailors will also be needed, and in considerable numbers?

Yes, in considerable numbers.

Then, again, within the city, how will they exchange their productions? To secure such an exchange was, as you will remember, one of our principal objects when we formed them into a society and constituted a State.

Clearly they will buy and sell.

Then they will need a marketplace, and a moneytoken for purposes of exchange.

Certainly.

Suppose now that a husbandman or an artisan brings some production to market, and he comes at a time when there is no one to exchange with him -- is he to leave his calling

and sit idle in the marketplace?

Not at all; he will find people there who, seeing the want, undertake the office of salesmen. In wellordered States they are commonly those who are the weakest in bodily strength, and therefore of little use for any other purpose; their duty is to be in the market, and to give money in exchange for goods to those who desire to sell, and to take money from those who desire to buy.

This want, then, creates a class of retailtraders in our State. Is not "retailer" the term which is applied to those who sit in the marketplace engaged in buying and selling, while those who wander from one city to another are called merchants?

Yes, he said.

And there is another class of servants, who are intellectually hardly on the level of companionship; still they have plenty of bodily strength for labor, which accordingly they sell, and are called, if I do not mistake, hirelings, "hire" being the name which is given to the price of their labor.

True.

Then hirelings will help to make up our population?

Yes.

And now, Adeimantus, is our State matured and perfected?

I think so.

Where, then, is justice, and where is injustice, and in what part of the State did they spring up?

Probably in the dealings of these citizens with one another. I cannot imagine that they are more likely to be found anywhere else.

I dare say that you are right in your suggestion, I said; we had better think the matter out, and not shrink from the inquiry.

Let us then consider, first of all, what will be their way of life, now that we have thus established them. Will they not produce corn and wine and clothes and shoes, and build houses for themselves? And when they are housed, they will work, in summer, commonly, stripped and barefoot, but in winter substantially clothed and shod. They will feed on barleymeal and flour of wheat, baking and kneading them, making noble cakes and loaves; these they will serve up on a mat of reeds or on clean leaves, themselves reclining the while upon beds strewn with yew or myrtle. And they and their children will feast, drinking of the wine which they have made, wearing garlands on their heads, and hymning the praises of the gods, in happy converse with one another. And they will take care that their families do not exceed their

means; having an eye to poverty or war.

But, said Glaucon, interposing, you have not given them a relish to their meal.

True, I replied, I had forgotten; of course they must have a relish -- salt and olives and cheese -- and they will boil roots and herbs such as country people prepare; for a dessert we shall give them figs and peas and beans; and they will roast myrtleberries and acorns at the fire, drinking in moderation. And with such a diet they may be expected to live in peace and health to a good old age, and bequeath a similar life to their children after them.

Yes, Socrates, he said, and if you were providing for a city of pigs, how else would you feed the beasts?

But what would you have, Glaucon? I replied.

Why, he said, you should give them the ordinary conveniences of life. People who are to be comfortable are accustomed to lie on sofas, and dine off tables, and they should have sauces and sweets in the modern style.

Yes, I said, now I understand: the question which you would have me consider is, not only how a State, but how a luxurious State is created; and possibly there is no harm in this, for in such a State we shall be more likely to see how justice and injustice originate. In my opinion the true and healthy constitution of the State is the one which I have described. But if you wish also to see a State at feverheat, I have no objection. For I suspect that many will not be satisfied with the simpler way of life. They will be for adding sofas and tables and other furniture; also dainties and perfumes and incense and courtesans and cakes, all these not of one sort only, but in every variety. We must go beyond the necessaries of which I was at first speaking, such as houses and clothes and shoes; the arts of the painter and the embroiderer will have to be set in motion, and gold and ivory and all sorts of materials must be procured.

True, he said.

Then we must enlarge our borders; for the original healthy State is no longer sufficient. Now will the city have to fill and swell with a multitude of callings which are not required by any natural want; such as the whole tribe of hunters and actors, of whom one large class have to do with forms and colors; another will be the votaries of music -- poets and their attendant train of rhapsodists, players, dancers, contractors; also makers of divers kinds of articles, including women's dresses. And we shall want more servants. Will not tutors be also in request, and nurses wet and dry, tirewomen and barbers, as well as confectioners and cooks; and swineherds, too, who were not needed and therefore had no place in the former edition of our State, but are needed now? They must not be forgotten: and there will be animals of many other kinds, if people eat them.

Certainly.

And living in this way we shall have much greater need of physicians than before?

Much greater.

And the country which was enough to support the original inhabitants will be too small now, and not enough?

Quite true.

Then a slice of our neighbors' land will be wanted by us for pasture and tillage, and they will want a slice of ours, if, like ourselves, they exceed the limit of necessity, and give themselves up to the unlimited accumulation of wealth?

That, Socrates, will be inevitable.

And so we shall go to war, Glaucon. Shall we not?

Most certainly, he replied. Then, without determining as yet whether war does good or harm, thus much we may affirm, that now we have discovered war to be derived from causes which are also the causes of almost all the evils in States, private as well as public.

Undoubtedly.

And our State must once more enlarge; and this time the enlargement will be nothing short of a whole army, which will have to go out and fight with the invaders for all that we have, as well as for the things and persons whom we were describing above.

Why? he said; are they not capable of defending themselves?

No, I said; not if we were right in the principle which was acknowledged by all of us when we were framing the State. The principle, as you will remember, was that one man cannot practise many arts with success.

Very true, he said.

But is not war an art?

Certainly.

And an art requiring as much attention as shoemaking?

Quite true.

And the shoemaker was not allowed by us to be a husbandman, or a weaver, or a builder -- in order that we might have our shoes well made; but to him and to every other worker was assigned one work for which he was by nature fitted, and at that he was to continue working all his life long and at no other; he was not to let opportunities slip, and then he would become a good workman.

Now nothing can be more important than that the work of a soldier should be well done. But is war an art so easily acquired that a man may be a warrior who is also a husbandman, or shoemaker, or other artisan; although no one in the world would be a good dice or draught player who merely took up the game as a recreation, and had not from his earliest years devoted himself to this and nothing else?

No tools will make a man a skilled workman or master of defence, nor be of any use to him who has not learned how to handle them, and has never bestowed any attention upon them. How, then, will he who takes up a shield or other implement of war become a good fighter all in a day, whether with heavyarmed or any other kind of troops?

Yes, he said, the tools which would teach men their own use would be beyond price.

And the higher the duties of the guardian, I said, the more time and skill and art and application will be needed by him?

No doubt, he replied.

Will he not also require natural aptitude for his calling?

Certainly.

Then it will be our duty to select, if we can, natures which are fitted for the task of guarding the city?

It will.

And the selection will be no easy matter, I said; but we must be brave and do our best.

We must.

Is not the noble youth very like a wellbred dog in respect of guarding and watching?

What do you mean?

I mean that both of them ought to be quick to see, and swift to overtake the enemy when they see him; and strong too if, when they have caught him, they have to fight with him.

All these qualities, he replied, will certainly be required by them.

Well, and your guardian must be brave if he is to fight well?

Certainly.

And is he likely to be brave who has no spirit, whether horse or dog or any other animal? Have you never observed how invincible and unconquerable is spirit and how the presence of it makes the soul of any creature to be

absolutely fearless and indomitable?

I have.

Then now we have a clear notion of the bodily qualities which are required in the guardian.

True.

And also of the mental ones; his soul is to be full of spirit?

Yes.

But are not these spirited natures apt to be savage with one another, and with everybody else?

A difficulty by no means easy to overcome, he replied.

Whereas, I said, they ought to be dangerous to their enemies, and gentle to their friends; if not, they will destroy themselves without waiting for their enemies to destroy them.

True, he said.

What is to be done, then? I said; how shall we find a gentle nature which has also a great spirit, for the one is the contradiction of the other?

True.

He will not be a good guardian who is wanting in either of these two qualities; and yet the combination of them appears to be impossible; and hence we must infer that to be a good guardian is impossible.

I am afraid that what you say is true, he replied.

Here feeling perplexed I began to think over what had preceded. My friend, I said, no wonder that we are in a perplexity; for we have lost sight of the image which we had before us.

What do you mean? he said.

I mean to say that there do exist natures gifted with those opposite qualities.

And where do you find them?

Many animals, I replied, furnish examples of them; our friend the dog is a very good one: you know that wellbred dogs are perfectly gentle to their familiars and acquaintances, and the reverse to strangers.

Yes, I know.

Then there is nothing impossible or out of the order of nature in our finding a guardian who has a similar combination of qualities?

Certainly not.

Would not he who is fitted to be a guardian, besides the spirited nature, need to have the qualities of a philosopher?

I do not apprehend your meaning.

The trait of which I am speaking, I replied, may be also seen in the dog, and is remarkable in the animal.

What trait?

Why, a dog, whenever he sees a stranger, is angry; when an acquaintance, he welcomes him, although the one has never done him any harm, nor the other any good. Did this never strike you as curious?

The matter never struck me before; but I quite recognize the truth of your remark.

And surely this instinct of the dog is very charming; your dog is a true philosopher.

Why?

Why, because he distinguishes the face of a friend and of an enemy only by the criterion of knowing and not knowing. And must not an animal be a lover of learning who determines what he likes and dislikes by the test of knowledge and ignorance?

Most assuredly.

And is not the love of learning the love of wisdom, which is philosophy?

They are the same, he replied.

And may we not say confidently of man also, that he who is likely to be gentle to his friends and acquaintances, must by nature be a lover of wisdom and knowledge?

That we may safely affirm.

Then he who is to be a really good and noble guardian of the State will require to unite in himself philosophy and spirit and swiftness and strength?

Undoubtedly.

Then we have found the desired natures; and now that we have found them, how are they to be reared and educated? Is not this an inquiry which may be expected to throw light on the greater inquiry which is our final end -- How do justice and injustice grow up in States? for we do not want either to omit what is to the point or to draw out the argument to an inconvenient length.

Adeimantus thought that the inquiry would be of great

service to us.

Then, I said, my dear friend, the task must not be given up, even if somewhat long.

Certainly not.

Come then, and let us pass a leisure hour in storytelling, and our story shall be the education of our heroes.

By all means.

And what shall be their education? Can we find a better than the traditional sort? -- and this has two divisions, gymnastics for the body, and music for the soul.

True.

Shall we begin education with music, and go on to gymnastics afterward?

By all means.

And when you speak of music, do you include literature or not?

I do.

And literature may be either true or false?

Yes.

And the young should be trained in both kinds, and we begin with the false?

I do not understand your meaning, he said.

You know, I said, that we begin by telling children stories which, though not wholly destitute of truth, are in the main fictitious; and these stories are told them when they are not of an age to learn gymnastics.

Very true.

That was my meaning when I said that we must teach music before gymnastics.

Quite right, he said.

You know also that the beginning is the most important part of any work, especially in the case of a young and tender thing; for that is the time at which the character is being formed and the desired impression is more readily taken.

Quite true.

And shall we just carelessly allow children to hear any casual tales which may be devised by casual persons, and to receive into their minds ideas for the most part the very

opposite of those which we should wish them to have when they are grown up?

We cannot.

Then the first thing will be to establish a censorship of the writers of fiction, and let the censors receive any tale of fiction which is good, and reject the bad; and we will desire mothers and nurses to tell their children the authorized ones only. Let them fashion the mind with such tales, even more fondly than they mould the body with their hands; but most of those which are now in use must be discarded.

Of what tales are you speaking? he said.

You may find a model of the lesser in the greater, I said; for they are necessarily of the same type, and there is the same spirit in both of them.

Very likely, he replied; but I do not as yet know what you would term the greater.

Those, I said, which are narrated by Homer and Hesiod, and the rest of the poets, who have ever been the great storytellers of mankind.

But which stories do you mean, he said; and what fault do you find with them?

A fault which is most serious, I said; the fault of telling a lie, and, what is more, a bad lie.

But when is this fault committed?

Whenever an erroneous representation is made of the nature of gods and heroes -- as when a painter paints a portrait not having the shadow of a likeness to the original.

Yes, he said, that sort of thing is certainly very blamable; but what are the stories which you mean?

First of all, I said, there was that greatest of all lies in high places, which the poet told about Uranus, and which was a bad lie too -- I mean what Hesiod says that Uranus did, and how Cronus retaliated on him. The doings of Cronus, and the sufferings which in turn his son inflicted upon him, even if they were true, ought certainly not to be lightly told to young and thoughtless persons; if possible, they had better be buried in silence. But if there is an absolute necessity for their mention, a chosen few might hear them in a mystery, and they should sacrifice not a common [Eleusinian] pig, but some huge and unprocurable victim; and then the number of the hearers will be very few indeed.

Why, yes, said he, those stories are extremely objectionable.

Yes, Adeimantus, they are stories not to be repeated in

our State; the young man should not be told that in committing the worst of crimes he is far from doing anything outrageous; and that even if he chastises his father when he does wrong, in whatever manner, he will only be following the example of the first and greatest among the gods.

I entirely agree with you, he said; in my opinion those stories are quite unfit to be repeated.

Neither, if we mean our future guardians to regard the habit of quarrelling among themselves as of all things the basest, should any word be said to them of the wars in heaven, and of the plots and fightings of the gods against one another, for they are not true. No, we shall never mention the battles of the giants, or let them be embroidered on garments; and we shall be silent about the innumerable other quarrels of gods and heroes with their friends and relatives. If they would only believe us we would tell them that quarrelling is unholy, and that never up to this time has there been any quarrel between citizens; this is what old men and old women should begin by telling children; and when they grow up, the poets also should be told to compose them in a similar spirit. But the narrative of Hephaestus binding Here his mother, or how on another occasion Zeus sent him flying for taking her part when she was being beaten, and all the battles of the gods in Homer -- these tales must not be admitted into our State, whether they are supposed to have an allegorical meaning or not. For a young person cannot judge what is allegorical and what is literal; anything that he receives into his mind at that age is likely to become indelible and unalterable; and therefore it is most important that the tales which the young first hear should be models of virtuous thoughts.

There you are right, he replied; but if anyone asks where are such models to be found and of what tales are you speaking -- how shall we answer him?

I said to him, You and I, Adeimantus, at this moment are not poets, but founders of a State: now the founders of a State ought to know the general forms in which poets should cast their tales, and the limits which must be observed by them, but to make the tales is not their business.

Very true, he said; but what are these forms of theology which you mean?

Something of this kind, I replied: God is always to be represented as he truly is, whatever be the sort of poetry, epic, lyric, or tragic, in which the representation is given.

Right.

And is he not truly good? and must he not be represented as such?

Certainly.

And no good thing is hurtful?

No, indeed.

And that which is not hurtful hurts not?

Certainly not.

And that which hurts not does no evil?

No.

And can that which does no evil be a cause of evil?

Impossible.

And the good is advantageous?

Yes.

And therefore the cause of wellbeing?

Yes.

It follows, therefore, that the good is not the cause of all things, but of the good only?

Assuredly.

Then God, if he be good, is not the author of all things, as the many assert, but he is the cause of a few things only, and not of most things that occur to men. For few are the goods of human life, and many are the evils, and the good is to be attributed to God alone; of the evils the causes are to be sought elsewhere, and not in him.

That appears to me to be most true, he said.

Then we must not listen to Homer or to any other poet who is guilty of the folly of saying that two casks

"Lie at the threshold of Zeus, full of lots, one of good, the other of evil lots,"

and that he to whom Zeus gives a mixture of the two

"Sometimes meets with evil fortune, at other times with good;"

but that he to whom is given the cup of unmingled ill,

"Him wild hunger drives o'er the beauteous earth."

And again --

"Zeus, who is the dispenser of good and evil to us."

And if anyone asserts that the violation of oaths and treaties, which was really the work of Pandarus, was brought about by Athene and Zeus, or that the strife and contention of the gods were instigated by Themis and Zeus, he shall not have our approval; neither will we allow our young men to

hear the words of AEschylus, that

"God plants guilt among men when he desires utterly to destroy a house."

And if a poet writes of the sufferings of Niobe -- the subject of the tragedy in which these iambic verses occur -- or of the house of Pelops, or of the Trojan War or on any similar theme, either we must not permit him to say that these are the works of God, or if they are of God, he must devise some explanation of them such as we are seeking: he must say that God did what was just and right, and they were the better for being punished; but that those who are punished are miserable, and that God is the author of their misery -- the poet is not to be permitted to say; though he may say that the wicked are miserable because they require to be punished, and are benefited by receiving punishment from God; but that God being good is the author of evil to anyone is to be strenuously denied, and not to be said or sung or heard in verse or prose by anyone whether old or young in any wellordered commonwealth. Such a fiction is suicidal, ruinous, impious.

I agree with you, he replied, and am ready to give my assent to the law.

Let this then be one of our rules and principles concerning the gods, to which our poets and reciters will be expected to conform -- that God is not the author of all things, but of good only.

That will do, he said.

And what do you think of a second principle? Shall I ask you whether God is a magician, and of a nature to appear insidiously now in one shape, and now in another -- sometimes himself changing and passing into many forms, sometimes deceiving us with the semblance of such transformations; or is he one and the same immutably fixed in his own proper image?

I cannot answer you, he said, without more thought.

Well, I said; but if we suppose a change in anything, that change must be effected either by the thing itself or by some other thing?

Most certainly.

And things which are at their best are also least liable to be altered or discomposed; for example, when healthiest and strongest, the human frame is least liable to be affected by meats and drinks, and the plant which is in the fullest vigor also suffers least from winds or the heat of the sun or any similar causes.

Of course.

And will not the bravest and wisest soul be least confused or deranged by any external influence?

True.

And the same principle, as I should suppose, applies to all composite things -- furniture, houses, garments: when good and well made, they are least altered by time and circumstances.

Very true.

Then everything which is good, whether made by art or nature, or both, is least liable to suffer change from without?

True.

But surely God and the things of God are in every way perfect?

Of course they are.

Then he can hardly be compelled by external influence to take many shapes?

He cannot.

But may he not change and transform himself?

Clearly, he said, that must be the case if he is changed at all.

And will he then change himself for the better and fairer, or for the worse and more unsightly?

If he change at all he can only change for the worse, for we cannot suppose him to be deficient either in virtue or beauty.

Very true, Adeimantus; but then, would anyone, whether God or man, desire to make himself worse?

Impossible.

Then it is impossible that God should ever be willing to change; being, as is supposed, the fairest and best that is conceivable, every God remains absolutely and forever in his own form.

That necessarily follows, he said, in my judgment.

Then, I said, my dear friend, let none of the poets tell us that

"The gods, taking the disguise of strangers from other lands, walk up and down cities in all sorts of forms;"

and let no one slander Proteus and Thetis, neither let anyone, either in tragedy or in any other kind of poetry, introduce Here disguised in the likeness of a priestess asking an alms

"For the lifegiving daughters of Inachus the river of

Argos;"

-- let us have no more lies of that sort. Neither must we have mothers under the influence of the poets scaring their children with a bad version of these myths -- telling how certain gods, as they say, "Go about by night in the likeness of so many strangers and in divers forms;" but let them take heed lest they make cowards of their children, and at the same time speak blasphemy against the gods.

Heaven forbid, he said.

But although the gods are themselves unchangeable, still by witchcraft and deception they may make us think that they appear in various forms?

Perhaps, he replied.

Well, but can you imagine that God will be willing to lie, whether in word or deed, or to put forth a phantom of himself?

I cannot say, he replied.

Do you not know, I said, that the true lie, if such an expression may be allowed, is hated of gods and men?

What do you mean? he said.

I mean that no one is willingly deceived in that which is the truest and highest part of himself, or about the truest and highest matters; there, above all, he is most afraid of a lie having possession of him.

Still, he said, I do not comprehend you.

The reason is, I replied, that you attribute some profound meaning to my words; but I am only saying that deception, or being deceived or uninformed about the highest realities in the highest part of themselves, which is the soul, and in that part of them to have and to hold the lie, is what mankind least like; -- that, I say, is what they utterly detest.

There is nothing more hateful to them.

And, as I was just now remarking, this ignorance in the soul of him who is deceived may be called the true lie; for the lie in words is only a kind of imitation and shadowy image of a previous affection of the soul, not pure unadulterated falsehood. Am I not right?

Perfectly right.

The true lie is hated not only by the gods, but also by men?

Yes.

Whereas the lie in words is in certain cases useful and not hateful; in dealing with enemies -- that would be an

instance; or again, when those whom we call our friends in a fit of madness or illusion are going to do some harm, then it is useful and is a sort of medicine or preventive; also in the tales of mythology, of which we were just now speaking -- because we do not know the truth about ancient times, we make falsehood as much like truth as we can, and so turn it to account.

Very true, he said.

But can any of these reasons apply to God? Can we suppose that he is ignorant of antiquity, and therefore has recourse to invention?

That would be ridiculous, he said.

Then the lying poet has no place in our idea of God?

I should say not.

Or perhaps he may tell a lie because he is afraid of enemies?

That is inconceivable.

But he may have friends who are senseless or mad?

But no mad or senseless person can be a friend of God.

Then no motive can be imagined why God should lie?

None whatever.

Then the superhuman, and divine, is absolutely incapable of falsehood?

Yes.

Then is God perfectly simple and true both in word and deed; he changes not; he deceives not, either by sign or word, by dream or waking vision.

Your thoughts, he said, are the reflection of my own.

You agree with me then, I said, that this is the second type or form in which we should write and speak about divine things. The gods are not magicians who transform themselves, neither do they deceive mankind in any way.

I grant that.

Then, although we are admirers of Homer, we do not admire the lying dream which Zeus sends to Agamemnon; neither will we praise the verses of AEschylus in which Thetis says that Apollo at her nuptials

"was celebrating in song her fair progeny whose days were to be long, and to know no sickness. And when he had spoken of my lot as in all things blessed of heaven, he raised a note of triumph and cheered my soul. And I thought that the word of Phoebus, being divine and full of prophecy,

would not fail. And now he himself who uttered the strain, he who was present at the banquet, and who said this -- he it is who has slain my son."

These are the kind of sentiments about the gods which will arouse our anger; and he who utters them shall be refused a chorus; neither shall we allow teachers to make use of them in the instruction of the young, meaning, as we do, that our guardians, as far as men can be, should be true worshippers of the gods and like them.

I entirely agree, he said, in these principles, and promise to make them my laws.

* * * *

Book III: The Arts In Education

(Socrates, Adeimantus.)

SUCH, then, I said, are our principles of theology -- some tales are to be told, and others are not to be told to our disciples from their youth upward, if we mean them to honor the gods and their parents, and to value friendship with one another.

Yes; and I think that our principles are right, he said.

But if they are to be courageous, must they not learn other lessons beside these, and lessons of such a kind as will take away the fear of death? Can any man be courageous who has the fear of death in him?

Certainly not, he said.

And can he be fearless of death, or will he choose death in battle rather than defeat and slavery, who believes the world below to be real and terrible?

Impossible.

Then we must assume a control over the narrators of this class of tales as well as over the others, and beg them not simply to revile, but rather to commend the world below, intimating to them that their descriptions are untrue, and will do harm to our future warriors.

That will be our duty, he said.

Then, I said, we shall have to obliterate many obnoxious passages, beginning with the verses

"I would rather be a serf on the land of a poor and portionless man than rule over all the dead who have come to naught."

We must also expunge the verse which tells us how Pluto feared

"Lest the mansions grim and squalid which the gods

abhor should be seen both of mortals and immortals."

And again:

"O heavens! verily in the house of Hades there is soul and ghostly form but no mind at all!"

Again of Tiresias:

"[To him even after death did Persephone grant mind,] that he alone should be wise; but the other souls are flitting shades."

Again:

"The soul flying from the limbs had gone to Hades, lamentng her fate, leaving manhood and youth."

Again:

"And the soul, with shrilling cry, passed like smoke beneath the earth."

And,

"As bats in hollow of mystic cavern, whenever any of them has dropped out of the string and falls from the rock, fly shrilling and cling to one another, so did they with shrilling cry hold together as they moved."

And we must beg Homer and the other poets not to be angry if we strike out these and similar passages, not because they are unpoetical, or unattractive to the popular ear, but because the greater the poetical charm of them, the less are they meet for the ears of boys and men who are meant to be free, and who should fear slavery more than death.

Undoubtedly.

Also we shall have to reject all the terrible and appalling names which describe the world below -- Cocytus and Styx, ghosts under the earth, and sapless shades, and any similar words of which the very mention causes a shudder to pass through the inmost soul of him who hears them. I do not say that these horrible stories may not have a use of some kind; but there is a danger that the nerves of our guardians may be rendered too excitable and effeminate by them.

There is a real danger, he said.

Then we must have no more of them.

True.

Another and a nobler strain must be composed and sung by us.

Clearly.

And shall we proceed to get rid of the weepings and wailings of famous men?

They will go with the rest.

But shall we be right in getting rid of them? Reflect: our principle is that the good man will not consider death terrible to any other good man who is his comrade.

Yes; that is our principle.

And therefore he will not sorrow for his departed friend as though he had suffered anything terrible?

He will not.

Such an one, as we further maintain, is sufficient for himself and his own happiness, and therefore is least in need of other men.

True, he said.

And for this reason the loss of a son or brother, or the deprivation of fortune, is to him of all men least terrible.

Assuredly.

And therefore he will be least likely to lament, and will bear with the greatest equanimity any misfortune of this sort which may befall him.

Yes, he will feel such a misfortune far less than another.

Then we shall be right in getting rid of the lamentations of famous men, and making them over to women (and not even to women who are good for anything), or to men of a baser sort, that those who are being educated by us to be the defenders of their country may scorn to do the like.

That will be very right.

Then we will once more entreat Homer and the other poets not to depict Achilles, who is the son of a goddess, first lying on his side, then on his back, and then on his face; then starting up and sailing in a frenzy along the shores of the barren sea; now taking the sooty ashes in both his hands and pouring them over his head, or weeping and wailing in the various modes which Homer has delineated. Nor should he describe Priam, the kinsman of the gods, as praying and beseeching,

"Rolling in the dirt, calling each man loudly by his name."

Still more earnestly will we beg of him at all events not to introduce the gods lamenting and saying,

"Alas! my misery! Alas! that I bore the bravest to my sorrow."

But if he must introduce the gods, at any rate let him not dare so completely to misrepresent the greatest of the gods, as to make him say --

"O heavens! with my eyes verily I behold a dear friend of mine chased round and round the city, and my heart is sorrowful."

Or again:

"Woe is me that I am fated to have Sarpedon, dearest of men to me, subdued at the hands of Patroclus the son of Menoetius."

For if, my sweet Adeimantus, our youth seriously listen to such unworthy representations of the gods, instead of laughing at them as they ought, hardly will any of them deem that he himself, being but a man, can be dishonored by similar actions; neither will he rebuke any inclination which may arise in his mind to say and do the like. And instead of having any shame or selfcontrol, he will be always whining and lamenting on slight occasions.

Yes, he said, that is most true.

Yes, I replied; but that surely is what ought not to be, as the argument has just proved to us; and by that proof we must abide until it is disproved by a better.

It ought not to be.

Neither ought our guardians to be given to laughter. For a fit of laughter which has been indulged to excess almost always produces a violent reaction.

So I believe.

Then persons of worth, even if only mortal men, must not be represented as overcome by laughter, and still less must such a representation of the gods be allowed.

Still less of the gods, as you say, he replied.

Then we shall not suffer such an expression to be used about the gods as that of Homer when he describes how

"Inextinguishable laughter arose among the blessed gods, when they saw Hephaestus bustling about the mansion."

On your views, we must not admit them.

On my views, if you like to father them on me; that we must not admit them is certain.

Again, truth should be highly valued; if, as we were saying, a lie is useless to the gods, and useful only as a medicine to men, then the use of such medicines should be restricted to physicians; private individuals have no business with them.

Clearly not, he said.

Then if anyone at all is to have the privilege of lying, the rulers of the State should be the persons; and they, in their dealings either with enemies or with their own citizens, may be allowed to lie for the public good. But nobody else should meddle with anything of the kind; and although the rulers have this privilege, for a private man to lie to them in return is to be deemed a more heinous fault than for the patient or the pupil of a gymnasium not to speak the truth about his own bodily illnesses to the physician or to the trainer, or for a sailor not to tell the captain what is happening about the ship and the rest of the crew, and how things are going with himself or his fellowsailors.

Most true, he said.

If, then, the ruler catches anybody beside himself lying in the State,

"Any of the craftsmen, whether he be priest or physician or carpenter,"

he will punish him for introducing a practice which is equally subversive and destructive of ship or State.

Most certainly, he said, if our idea of the State is ever carried out.

In the next place our youth must be temperate?

Certainly.

Are not the chief elements of temperance, speaking generally, obedience to commanders and selfcontrol in sensual pleasures?

True.

Then we shall approve such language as that of Diomede in Homer,

"Friend sit still and obey my word,"

and the verses which follow,

"The Greeks marched breathing prowess,"

"...in silent awe of their leaders."

and other sentiments of the same kind.

We shall.

What of this line,

"O heavy with wine, who hast the eyes of a dog and the heart of a stag,"

and of the words which follow? Would you say that

these, or any similar impertinences which private individuals are supposed to address to their rulers, whether in verse or prose, are well or ill spoken?

They are ill spoken.

They may very possibly afford some amusement, but they do not conduce to temperance. And therefore they are likely to do harm to our young men -- you would agree with me there?

Yes.

And then, again, to make the wisest of men say that nothing in his opinion is more glorious than

"When the tables are full of bread and meat, and the cupbearer carries round wine which he draws from the bowl and pours into the cups;"

is it fit or conducive to temperance for a young man to hear such words? or the verse

"The saddest of fates is to die and meet destiny from hunger"?

What would you say again to the tale of Zeus, who, while other gods and men were asleep and he the only person awake, lay devising plans, but forgot them all in a moment through his lust, and was so completely overcome at the sight of Here that he would not even go into the hut, but wanted to lie with her on the ground, declaring that he had never been in such a state of rapture before, even when they first met one another,

"Without the knowledge of their parents"

or that other tale of how Hephaestus, because of similar goings on, cast a chain around Ares and Aphrodite?

Indeed, he said, I am strongly of opinion that they ought not to hear that sort of thing.

But any deeds of endurance which are done or told by famous men, these they ought to see and hear; as, for example, what is said in the verses,

"He smote his breast, and thus reproached his heart,
Endure, my heart; far worse hast thou endured!"

Certainly, he said.

In the next place, we must not let them be receivers of gifts or lovers of money.

Certainly not.

Neither must we sing to them of

"Gifts persuading gods, and persuading reverend kings."

Neither is Phoenix, the tutor of Achilles, to be approved or deemed to have given his pupil good counsel when he told him that he should take the gifts of the Greeks and assist them; but that without a gift he should not lay aside his anger. Neither will we believe or acknowledge Achilles himself to have been such a lover of money that he took Agamemnon's gifts, or that when he had received payment he restored the dead body of Hector, but that without payment he was unwilling to do so.

Undoubtedly, he said, these are not sentiments which can be approved.

Loving Homer as I do, I hardly like to say that in attributing these feelings to Achilles, or in believing that they are truly attributed to him, he is guilty of downright impiety. As little can I believe the narrative of his insolence to Apollo, where he says,

"Thou hast wronged me, O Fardarter, most abominable of deities. Verily I would be even with thee, if I had only the power;"

or his insubordination to the rivergod, on whose divinity he is ready to lay hands; or his offerings to the dead Patroclus of his own hair, which had been previously dedicated to the other rivergod Spercheius, and that he actually performed this vow; or that he dragged Hector round the tomb of Patroclus, and slaughtered the captives at the pyre; of all this I cannot believe that he was guilty, any more than I can allow our citizens to believe that he, the wise Cheiron's pupil, the son of a goddess and of Peleus who was the gentlest of men and third in descent from Zeus, was so disordered in his wits as to be at one time the slave of two seemingly inconsistent passions, meanness, not untainted by avarice, combined with overweening contempt of gods and men.

You are quite right, he replied.

And let us equally refuse to believe, or allow to be repeated, the tale of Theseus, son of Poseidon, or of Peirithous, son of Zeus, going forth as they did to perpetrate a horrid rape; or of any other hero or son of a god daring to do such impious and dreadful things as they falsely ascribe to them in our day: and let us further compel the poets to declare either that these acts were done by them, or that they were not the sons of God; both in the same breath they shall not be permitted to affirm. We will not have them trying to persuade our youth that the gods are the authors of evil, and that heroes are no better than men -- sentiments which, as we were saying, are neither pious nor true, for we have already proved that evil cannot come from the gods.

Assuredly not. And, further, they are likely to have a bad effect on those who hear them; for everybody will begin to excuse his own vices when he is convinced that similar wickednesses are always being perpetrated by

"The kindred of the gods, the relatives of Zeus, whose

ancestral altar, the altar of Zeus, is aloft in air on the peak of Ida,"

and who have

"the blood of deities yet flowing in their veins."

And therefore let us put an end to such tales, lest they engender laxity of morals among the young.

By all means, he replied.

But now that we are determining what classes of subjects are or are not to be spoken of, let us see whether any have been omitted by us. The manner in which gods and demigods and heroes and the world below should be treated has been already laid down.

Very true.

And what shall we say about men? That is clearly the remaining portion of our subject.

Clearly so.

But we are not in a condition to answer this question at present, my friend.

Why not?

Because, if I am not mistaken, we shall have to say that about men; poets and storytellers are guilty of making the gravest misstatements when they tell us that wicked men are often happy, and the good miserable; and that injustice is profitable when undetected, but that justice is a man's own loss and another's gain -- these things we shall forbid them to utter, and command them to sing and say the opposite.

To be sure we shall, he replied.

But if you admit that I am right in this, then I shall maintain that you have implied the principle for which we have been all along contending.

I grant the truth of your inference.

That such things are or are not to be said about men is a question which we cannot determine until we have discovered what justice is, and how naturally advantageous to the possessor, whether he seem to be just or not.

Most true, he said.

Enough of the subjects of poetry: let us now speak of the style; and when this has been considered, both matter and manner will have been completely treated.

I do not understand what you mean, said Adeimantus.

Then I must make you understand; and perhaps I may be

more intelligible if I put the matter in this way. You are aware, I suppose, that all mythology and poetry are a narration of events, either past, present, or to come?

Certainly, he replied.

And narration may be either simple narration or imitation, or a union of the two? That, again, he said, I do not quite understand.

I fear that I must be a ridiculous teacher when I have so much difficulty in making myself apprehended. Like a bad speaker, therefore, I will not take the whole of the subject, but will break a piece off in illustration of my meaning. You know the first lines of the "Iliad," in which the poet says that Chryses prayed Agamemnon to release his daughter, and that Agamemnon flew into a passion with him; whereupon Chryses, failing of his object, invoked the anger of the god against the Achaeans. Now as far as these lines,

"And he prayed all the Greeks, but especially the two sons of Atreus, the chiefs of the people,"

the poet is speaking in his own person; he never leads us to suppose that he is anyone else. But in what follows he takes the person of Chryses, and then he does all that he can to make us believe that the speaker is not Homer, but the aged priest himself. And in this double form he has cast the entire narrative of the events which occurred at Troy and in Ithaca and throughout the "Odyssey."

Yes.

And a narrative it remains both in the speeches which the poet recites from time to time and in the intermediate passages?

Quite true.

But when the poet speaks in the person of another, may we not say that he assimilates his style to that of the person who, as he informs you, is going to speak?

Certainly.

And this assimilation of himself to another, either by the use of voice or gesture, is the imitation of the person whose character he assumes?

Of course.

Then in this case the narrative of the poet may be said to proceed by way of imitation?

Very true.

Or, if the poet everywhere appears and never conceals himself, then again the imitation is dropped, and his poetry becomes simple narration. However, in order that I may make my meaning quite clear, and that you may no more say, "I don't understand," I will show how the change might be

effected. If Homer had said, "The priest came, having his daughter's ransom in his hands, supplicating the Achaeans, and above all the kings;" and then if, instead of speaking in the person of Chryses, he had continued in his own person, the words would have been, not imitation, but simple narration. The passage would have run as follows (I am no poet, and therefore I drop the metre): "The priest came and prayed the gods on behalf of the Greeks that they might capture Troy and return safely home, but begged that they would give him back his daughter, and take the ransom which he brought, and respect the god. Thus he spoke, and the other Greeks revered the priest and assented. But Agamemnon was wroth, and bade him depart and not come again, lest the staff and chaplets of the god should be of no avail to him -- the daughter of Chryses should not be released, he said -- she should grow old with him in Argos. And then he told him to go away and not to provoke him, if he intended to get home unscathed. And the old man went away in fear and silence, and, when he had left the camp, he called upon Apollo by his many names, reminding him of everything which he had done pleasing to him, whether in building his temples, or in offering sacrifice, and praying that his good deeds might be returned to him, and that the Achaeans might expiate his tears by the arrows of the god" -- and so on. In this way the whole becomes simple narrative.

I understand, he said.

Or you may suppose the opposite case -- that the intermediate passages are omitted, and the dialogue only left.

That also, he said, I understand; you mean, for example, as in tragedy.

You have conceived my meaning perfectly; and if I mistake not, what you failed to apprehend before is now made clear to you, that poetry and mythology are, in some cases, wholly imitative -- instances of this are supplied by tragedy and comedy; there is likewise the opposite style, in which the poet is the only speaker -- of this the dithyramb affords the best example; and the combination of both is found in epic and in several other styles of poetry. Do I take you with me?

Yes, he said; I see now what you meant.

I will ask you to remember also what I began by saying, that we had done with the subject and might proceed to the style.

Yes, I remember.

In saying this, I intended to imply that we must come to an understanding about the mimetic art -- whether the poets, in narrating their stories, are to be allowed by us to imitate, and if so, whether in whole or in part, and if the latter, in what parts; or should all imitation be prohibited?

You mean, I suspect, to ask whether tragedy and comedy

shall be admitted into our State?

Yes, I said; but there may be more than this in question: I really do not know as yet, but whither the argument may blow, thither we go.

And go we will, he said.

Then, Adeimantus, let me ask you whether our guardians ought to be imitators; or rather, has not this question been decided by the rule already laid down that one man can only do one thing well, and not many; and that if he attempt many, he will altogether fail of gaining much reputation in any?

Certainly.

And this is equally true of imitation; no one man can imitate many things as well as he would imitate a single one?

He cannot.

Then the same person will hardly be able to play a serious part in life, and at the same time to be an imitator and imitate many other parts as well; for even when two species of imitation are nearly allied, the same persons cannot succeed in both, as, for example, the writers of tragedy and comedy -- did you not just now call them imitations?

Yes, I did; and you are right in thinking that the same persons cannot succeed in both.

Any more than they can be rhapsodists and actors at once?

True.

Neither are comic and tragic actors the same; yet all these things are but imitations.

They are so.

And human nature, Adeimantus, appears to have been coined into yet smaller pieces, and to be as incapable of imitating many things well, as of performing well the actions of which the imitations are copies.

Quite true, he replied.

If then we adhere to our original notion and bear in mind that our guardians, setting aside every other business, are to dedicate themselves wholly to the maintenance of freedom in the State, making this their craft, and engaging in no work which does not bear on this end, they ought not to practise or imitate anything else; if they imitate at all, they should imitate from youth upward only those characters which are suitable to their profession -- the courageous, temperate, holy, free, and the like; but they should not depict or be skilful at imitating any kind of

illiberality or baseness, lest from imitation they should come to be what they imitate. Did you never observe how imitations, beginning in early youth and continuing far into life, at length grow into habits and become a second nature, affecting body, voice, and mind?

Yes, certainly, he said.

Then, I said, we will not allow those for whom we profess a care and of whom we say that they ought to be good men, to imitate a woman, whether young or old, quarrelling with her husband, or striving and vaunting against the gods in conceit of her happiness, or when she is in affliction, or sorrow, or weeping; and certainly not one who is in sickness, love, or labor.

Very right, he said.

Neither must they represent slaves, male or female, performing the offices of slaves?

They must not.

And surely not bad men, whether cowards or any others, who do the reverse of what we have just been prescribing, who scold or mock or revile one another in drink or out of drink, or who in any other manner sin against themselves and their neighbors in word or deed, as the manner of such is. Neither should they be trained to imitate the action or speech of men or women who are mad or bad; for madness, like vice, is to be known but not to be practised or imitated.

Very true, he replied.

Neither may they imitate smiths or other artificers, or oarsmen, or boatswains, or the like?

How can they, he said, when they are not allowed to apply their minds to the callings of any of these?

Nor may they imitate the neighing of horses, the bellowing of bulls, the murmur of rivers and roll of the ocean, thunder, and all that sort of thing?

Nay, he said, if madness be forbidden, neither may they copy the behavior of madmen.

You mean, I said, if I understand you aright, that there is one sort of narrative style which may be employed by a truly good man when he has anything to say, and that another sort will be used by a man of an opposite character and education.

And which are these two sorts? he asked.

Suppose, I answered, that a just and good man in the course of a narration comes on some saying or action of another good man -- I should imagine that he will like to personate him, and will not be ashamed of this sort of imitation: he will be most ready to play the part of the good man when he is acting firmly and wisely; in a less

degree when he is overtaken by illness or love or drink, or has met with any other disaster. But when he comes to a character which is unworthy of him, he will not make a study of that; he will disdain such a person, and will assume his likeness, if at all, for a moment only when he is performing some good action; at other times he will be ashamed to play a part which he has never practised, nor will he like to fashion and frame himself after the baser models; he feels the employment of such an art, unless in jest, to be beneath him, and his mind revolts at it.

So I should expect, he replied.

Then he will adopt a mode of narration such as we have illustrated out of Homer, that is to say, his style will be both imitative and narrative; but there will be very little of the former, and a great deal of the latter. Do you agree?

Certainly, he said; that is the model which such a speaker must necessarily take.

But there is another sort of character who will narrate anything, and, the worse he is, the more unscrupulous he will be; nothing will be too bad for him: and he will be ready to imitate anything, not as a joke, but in right good earnest, and before a large company. As I was just now saying, he will attempt to represent the roll of thunder, the noise of wind and hail, or the creaking of wheels, and pulleys, and the various sounds of flutes, pipes, trumpets, and all sorts of instruments: he will bark like a dog, bleat like a sheep, or crow like a cock; his entire art will consist in imitation of voice and gesture, and there will be very little narration.

That, he said, will be his mode of speaking.

These, then, are the two kinds of style?

Yes.

And you would agree with me in saying that one of them is simple and has but slight changes; and if the harmony and rhythm are also chosen for their simplicity, the result is that the speaker, if he speaks correctly, is always pretty much the same in style, and he will keep within the limits of a single harmony (for the changes are not great), and in like manner he will make use of nearly the same rhythm?

That is quite true, he said.

Whereas the other requires all sorts of harmonies and all sorts of rhythms, if the music and the style are to correspond, because the style has all sorts of changes.

That is also perfectly true, he replied.

And do not the two styles, or the mixture of the two, comprehend all poetry, and every form of expression in words? No one can say anything except in one or other of them or in both together.

They include all, he said.

And shall we receive into our State all the three styles, or one only of the two unmixed styles? or would you include the mixed?

I should prefer only to admit the pure imitator of virtue.

Yes, I said, Adeimantus; but the mixed style is also very charming: and indeed the pantomimic, which is the opposite of the one chosen by you, is the most popular style with children and their attendants, and with the world in general.

I do not deny it.

But I suppose you would argue that such a style is unsuitable to our State, in which human nature is not twofold or manifold, for one man plays one part only?

Yes; quite unsuitable.

And this is the reason why in our State, and in our State only, we shall find a shoemaker to be a shoemaker and not a pilot also, and a husbandman to be a husbandman and not a dicast also, and a soldier a soldier and not a trader also, and the same throughout?

True, he said.

And therefore when any one of these pantomimic gentlemen, who are so clever that they can imitate anything, comes to us, and makes a proposal to exhibit himself and his poetry, we will fall down and worship him as a sweet and holy and wonderful being; but we must also inform him that in our State such as he are not permitted to exist; the law will not allow them. And so when we have anointed him with myrrh, and set a garland of wool upon his head, we shall send him away to another city. For we mean to employ for our souls' health the rougher and severer poet or storyteller, who will imitate the style of the virtuous only, and will follow those models which we prescribed at first when we began the education of our soldiers.

We certainly will, he said, if we have the power.

Then now, my friend, I said, that part of music or literary education which relates to the story or myth may be considered to be finished; for the matter and manner have both been discussed.

I think so too, he said.

Next in order will follow melody and song.

That is obvious. Everyone can see already what we ought to say about them, if we are to be consistent with ourselves.

I fear, said Glaucon, laughing, that the word

"everyone" hardly includes me, for I cannot at the moment say what they should be; though I may guess.

At any rate you can tell that a song or ode has three parts -- the words, the melody, and the rhythm; that degree of knowledge I may presuppose?

Yes, he said; so much as that you may.

And as for the words, there will surely be no difference between words which are and which are not set to music; both will conform to the same laws, and these have been already determined by us?

Yes.

And the melody and rhythm will depend upon the words?

Certainly.

We were saying, when we spoke of the subjectmatter, that we had no need of lamentation and strains of sorrow?

True.

And which are the harmonies expressive of sorrow? You are musical, and can tell me.

The harmonies which you mean are the mixed or tenor Lydian, and the fulltoned or bass Lydian, and such like.

These then, I said, must be banished; they are of no use, even to women who have a character to maintain, and much less to men. Certainly.

In the next place, drunkenness and softness and indolence are utterly unbecoming the character of our guardians.

Utterly unbecoming.

And which are the soft or drinking harmonies?

The Ionian, he replied, and the Lydian; they are termed "relaxed."

Well, and are these of any military use?

Quite the reverse, he replied; and if so, the Dorian and the Phrygian are the only ones which you have left.

I answered: Of the harmonies I know nothing, but I want to have one warlike, to sound the note or accent which a brave man utters in the hour of danger and stern resolve, or when his cause is failing, and he is going to wounds or death or is overtaken by some other evil, and at every such crisis meets the blows of fortune with firm step and a determination to endure; and another to be used by him in times of peace and freedom of action, when there is no pressure of necessity, and he is seeking to persuade God by prayer, or man by instruction and admonition, or on the

other hand, when he is expressing his willingness to yield to persuasion or entreaty or admonition, and which represents him when by prudent conduct he has attained his end, not carried away by his success, but acting moderately and wisely under the circumstances, and acquiescing in the event. These two harmonies I ask you to leave; the strain of necessity and the strain of freedom, the strain of the unfortunate and the strain of the fortunate, the strain of courage, and the strain of temperance; these, I say, leave.

And these, he replied, are the Dorian and Phrygian harmonies of which I was just now speaking.

Then, I said, if these and these only are to be used in our songs and melodies, we shall not want multiplicity of notes or a panharmonic scale?

I suppose not.

Then we shall not maintain the artificers of lyres with three corners and complex scales, or the makers of any other manystringed, curiously harmonized instruments?

Certainly not.

But what do you say to flutemakers and fluteplayers? Would you admit them into our State when you reflect that in this composite use of harmony the flute is worse than all the stringed instruments put together; even the panharmonic music is only an imitation of the flute?

Clearly not.

There remain then only the lyre and the harp for use in the city, and the shepherds may have a pipe in the country.

That is surely the conclusion to be drawn from the argument.

The preferring of Apollo and his instruments to Marsyas and his instruments is not at all strange, I said.

Not at all, he replied.

And so, by the dog of Egypt, we have been unconsciously purging the State, which not long ago we termed luxurious.

And we have done wisely, he replied.

Then let us now finish the purgation, I said. Next in order to harmonies, rhythms will naturally follow, and they should be subject to the same rules, for we ought not to seek out complex systems of metre, or metres of every kind, but rather to discover what rhythms are the expressions of a courageous and harmonious life; and when we have found them, we shall adapt the foot and the melody to words having a like spirit, not the words to the foot and melody. To say what these rhythms are will be your duty -- you must teach me them, as you have already taught me the harmonies.

But, indeed, he replied, I cannot tell you. I only know

that there are some three principles of rhythm out of which metrical systems are framed, just as in sounds there are four notes out of which all the harmonies are composed; that is an observation which I have made. But of what sort of lives they are severally the imitations I am unable to say.

Then, I said, we must take Damon into our counsels; and he will tell us what rhythms are expressive of meanness, or insolence, or fury, or other unworthiness, and what are to be reserved for the expression of opposite feelings. And I think that I have an indistinct recollection of his mentioning a complex Cretic rhythm; also a dactylic or heroic, and he arranged them in some manner which I do not quite understand, making the rhythms equal in the rise and fall of the foot, long and short alternating; and, unless I am mistaken, he spoke of an iambic as well as of a trochaic rhythm, and assigned to them short and long quantities. Also in some cases he appeared to praise or censure the movement of the foot quite as much as the rhythm; or perhaps a combination of the two; for I am not certain what he meant. These matters, however, as I was saying, had better be referred to Damon himself, for the analysis of the subject would be difficult, you know?

Rather so, I should say.

But there is no difficulty in seeing that grace or the absence of grace is an effect of good or bad rhythm.

None at all.

And also that good and bad rhythm naturally assimilate to a good and bad style; and that harmony and discord in like manner follow style; for our principle is that rhythm and harmony are regulated by the words, and not the words by them.

Just so, he said, they should follow the words.

And will not the words and the character of the style depend on the temper of the soul?

Yes.

And everything else on the style?

Yes.

Then beauty of style and harmony and grace and good rhythm depend on simplicity -- I mean the true simplicity of a rightly and nobly ordered mind and character, not that other simplicity which is only an euphemism for folly?

Very true, he replied.

And if our youth are to do their work in life, must they not make these graces and harmonies their perpetual aim?

They must.

And surely the art of the painter and every other creative and constructive art are full of them -- weaving, embroidery, architecture, and every kind of manufacture; also nature, animal and vegetable -- in all of them there is grace or the absence of grace. And ugliness and discord and inharmonious motion are nearly allied to illwords and illnature, as grace and harmony are the twin sisters of goodness and virtue and bear their likeness.

That is quite true, he said.

But shall our superintendence go no further, and are the poets only to be required by us to express the image of the good in their works, on pain, if they do anything else, of expulsion from our State? Or is the same control to be extended to other artists, and are they also to be prohibited from exhibiting the opposite forms of vice and intemperance and meanness and indecency in sculpture and building and the other creative arts; and is he who cannot conform to this rule of ours to be prevented from practising his art in our State, lest the taste of our citizens be corrupted by him? We would not have our guardians grow up amid images of moral deformity, as in some noxious pasture, and there browse and feed upon many a baneful herb and flower day by day, little by little, until they silently gather a festering mass of corruption in their own soul. Let our artists rather be those who are gifted to discern the true nature of the beautiful and graceful; then will our youth dwell in a land of health, amid fair sights and sounds, and receive the good in everything; and beauty, the effluence of fair works, shall flow into the eye and ear, like a healthgiving breeze from a purer region, and insensibly draw the soul from earliest years into likeness and sympathy with the beauty of reason.

There can be no nobler training than that, he replied.

And therefore, I said, Glaucon, musical training is a more potent instrument than any other, because rhythm and harmony find their way into the inward places of the soul, on which they mightily fasten, imparting grace, and making the soul of him who is rightly educated graceful, or of him who is illeducated ungraceful; and also because he who has received this true education of the inner being will most shrewdly perceive omissions or faults in art and nature, and with a true taste, while he praises and rejoices over and receives into his soul the good, and becomes noble and good, he will justly blame and hate the bad, now in the days of his youth, even before he is able to know the reason why; and when reason comes he will recognize and salute the friend with whom his education has made him long familiar.

Yes, he said, I quite agree with you in thinking that our youth should be trained in music and on the grounds which you mention.

Just as in learning to read, I said, we were satisfied when we knew the letters of the alphabet, which are very few, in all their recurring sizes and combinations; not slighting them as unimportant whether they occupy a space large or small, but everywhere eager to make them out; and

not thinking ourselves perfect in the art of reading until we recognize them wherever they are found: True --

Or, as we recognize the reflection of letters in the water, or in a mirror, only when we know the letters themselves; the same art and study giving us the knowledge of both: Exactly --

Even so, as I maintain, neither we nor our guardians, whom we have to educate, can ever become musical until we and they know the essential forms of temperance, courage, liberality, magnificence, and their kindred, as well as the contrary forms, in all their combinations, and can recognize them and their images wherever they are found, not slighting them either in small things or great, but believing them all to be within the sphere of one art and study.

Most assuredly.

And when a beautiful soul harmonizes with a beautiful form, and the two are cast in one mould, that will be the fairest of sights to him who has an eye to see it?

The fairest indeed.

And the fairest is also the loveliest?

That may be assumed.

And the man who has the spirit of harmony will be most in love with the loveliest; but he will not love him who is of an inharmonious soul?

That is true, he replied, if the deficiency be in his soul; but if there be any merely bodily defect in another he will be patient of it, and will love all the same.

I perceive, I said, that you have or have had experiences of this sort, and I agree. But let me ask you another question: Has excess of pleasure any affinity to temperance?

How can that be? he replied; pleasure deprives a man of the use of his faculties quite as much as pain.

Or any affinity to virtue in general?

None whatever.

Any affinity to wantonness and intemperance?

Yes, the greatest.

And is there any greater or keener pleasure than that of sensual love?

No, nor a madder.

Whereas true love is a love of beauty and order -- temperate and harmonious?

Quite true, he said.

Then no intemperance or madness should be allowed to approach true love?

Certainly not.

Then mad or intemperate pleasure must never be allowed to come near the lover and his beloved; neither of them can have any part in it if their love is of the right sort?

No, indeed, Socrates, it must never come near them.

Then I suppose that in the city which we are founding you would make a law to the effect that a friend should use no other familiarity to his love than a father would use to his son, and then only for a noble purpose, and he must first have the other's consent; and this rule is to limit him in all his intercourse, and he is never to be seen going further, or, if he exceeds, he is to be deemed guilty of coarseness and bad taste.

I quite agree, he said.

Thus much of music, which makes a fair ending; for what should be the end of music if not the love of beauty?

I agree, he said.

After music comes gymnastics, in which our youth are next to be trained.

Certainly. Gymnastics as well as music should begin in early years; the training in it should be careful and should continue through life. Now my belief is -- and this is a matter upon which I should like to have your opinion in confirmation of my own, but my own belief is -- not that the good body by any bodily excellence improves the soul, but, on the contrary, that the good soul, by her own excellence, improves the body as far as this may be possible. What do you say?

Yes, I agree.

Then, to the mind when adequately trained, we shall be right in handing over the more particular care of the body; and in order to avoid prolixity we will now only give the general outlines of the subject.

Very good.

That they must abstain from intoxication has been already remarked by us; for of all persons a guardian should be the last to get drunk and not know where in the world he is.

Yes, he said; that a guardian should require another guardian to take care of him is ridiculous indeed.

But next, what shall we say of their food; for the men are in training for the great contest of all -- are they

not?

Yes, he said.

And will the habit of body of our ordinary athletes be suited to them?

Why not?

I am afraid, I said, that a habit of body such as they have is but a sleepy sort of thing, and rather perilous to health. Do you not observe that these athletes sleep away their lives, and are liable to most dangerous illnesses if they depart, in ever so slight a degree, from their customary regimen?

Yes, I do.

Then, I said, a finer sort of training will be required for our warrior athletes, who are to be like wakeful dogs, and to see and hear with the utmost keenness; amid the many changes of water and also of food, of summer heat and winter cold, which they will have to endure when on a campaign, they must not be liable to break down in health.

That is my view.

The really excellent gymnastics is twin sister of that simple music which we were just now describing.

How so?

Why, I conceive that there is a gymnastics which, like our music, is simple and good; and especially the military gymnastics.

What do you mean?

My meaning may be learned from Homer; he, you know, feeds his heroes at their feasts, when they are campaigning, on soldiers' fare; they have no fish, although they are on the shores of the Hellespont, and they are not allowed boiled meats, but only roast, which is the food most convenient for soldiers, requiring only that they should light a fire, and not involving the trouble of carrying about pots and pans.

True.

And I can hardly be mistaken in saying that sweet sauces are nowhere mentioned in Homer. In proscribing them, however, he is not singular; all professional athletes are well aware that a man who is to be in good condition should take nothing of the kind.

Yes, he said; and knowing this, they are quite right in not taking them.

Then you would not approve of Syracusan dinners, and the refinements of Sicilian cookery?

I think not.

Nor, if a man is to be in condition, would you allow him to have a Corinthian girl as his fair friend?

Certainly not.

Neither would you approve of the delicacies, as they are thought, of Athenian confectionery?

Certainly not.

All such feeding and living may be rightly compared by us to melody and song composed in the panharmonic style, and in all the rhythms. Exactly.

There complexity engendered license, and here disease; whereas simplicity in music was the parent of temperance in the soul; and simplicity in gymnastics of health in the body.

Most true, he said.

But when intemperance and diseases multiply in a State, halls of justice and medicine are always being opened; and the arts of the doctor and the lawyer give themselves airs, finding how keen is the interest which not only the slaves but the freemen of a city take about them.

Of course.

And yet what greater proof can there be of a bad and disgraceful state of education than this, that not only artisans and the meaner sort of people need the skill of firstrate physicians and judges, but also those who would profess to have had a liberal education? Is it not disgraceful, and a great sign of the want of goodbreeding, that a man should have to go abroad for his law and physic because he has none of his own at home, and must therefore surrender himself into the hands of other men whom he makes lords and judges over him?

Of all things, he said, the most disgraceful.

Would you say "most," I replied, when you consider that there is a further stage of the evil in which a man is not only a lifelong litigant, passing all his days in the courts, either as plaintiff or defendant, but is actually led by his bad taste to pride himself on his litigiousness; he imagines that he is a master in dishonesty; able to take every crooked turn, and wriggle into and out of every hole, bending like a withy and getting out of the way of justice: and all for what? -- in order to gain small points not worth mentioning, he not knowing that so to order his life as to be able to do without a napping judge is a far higher and nobler sort of thing. Is not that still more disgraceful?

Yes, he said, that is still more disgraceful.

Well, I said, and to require the help of medicine, not when a wound has to be cured, or on occasion of an epidemic,

but just because, by indolence and a habit of life such as we have been describing, men fill themselves with waters and winds, as if their bodies were a marsh, compelling the ingenious sons of Asclepius to find more names for diseases, such as flatulence and catarrh; is not this, too, a disgrace?

Yes, he said, they do certainly give very strange and newfangled names to diseases.

Yes, I said, and I do not believe that there were any such diseases in the days of Asclepius; and this I infer from the circumstance that the hero Eurypylus, after he has been wounded in Homer, drinks a posset of Pramnian wine well besprinkled with barleymeal and grated cheese, which are certainly inflammatory, and yet the sons of Asclepius who were at the Trojan war do not blame the damsel who gives him the drink, or rebuke Patroclus, who is treating his case.

Well, he said, that was surely an extraordinary drink to be given to a person in his condition.

Not so extraordinary, I replied, if you bear in mind that in former days, as is commonly said, before the time of Herodicus, the guild of Asclepius did not practise our present system of medicine, which may be said to educate diseases. But Herodicus, being a trainer, and himself of a sickly constitution, by a combination of training and doctoring found out a way of torturing first and chiefly himself, and secondly the rest of the world.

How was that? he said.

By the invention of lingering death; for he had a mortal disease which he perpetually tended, and as recovery was out of the question, he passed his entire life as a valetudinarian; he could do nothing but attend upon himself, and he was in constant torment whenever he departed in anything from his usual regimen, and so dying hard, by the help of science he struggled on to old age.

A rare reward of his skill!

Yes, I said; a reward which a man might fairly expect who never understood that, if Asclepius did not instruct his descendants in valetudinarian arts, the omission arose, not from ignorance or inexperience of such a branch of medicine, but because he knew that in all wellordered States every individual has an occupation to which he must attend, and has therefore no leisure to spend in continually being ill. This we remark in the case of the artisan, but, ludicrously enough, do not apply the same rule to people of the richer sort.

How do you mean? he said.

I mean this: When a carpenter is ill he asks the physician for a rough and ready cure; an emetic or a purge or a cautery or the knife -- these are his remedies. And if someone prescribes for him a course of dietetics, and tells him that he must swathe and swaddle his head, and all that

sort of thing, he replies at once that he has no time to be ill, and that he sees no good in a life which is spent in nursing his disease to the neglect of his customary employment; and therefore bidding goodby to this sort of physician, he resumes his ordinary habits, and either gets well and lives and does his business, or, if his constitution fails, he dies and has no more trouble.

Yes, he said, and a man in his condition of life ought to use the art of medicine thus far only.

Has he not, I said, an occupation; and what profit would there be in his life if he were deprived of his occupation?

Quite true, he said.

But with the rich man this is otherwise; of him we do not say that he has any specially appointed work which he must perform, if he would live.

He is generally supposed to have nothing to do.

Then you never heard of the saying of Phocylides, that as soon as a man has a livelihood he should practise virtue?

Nay, he said, I think that he had better begin somewhat sooner.

Let us not have a dispute with him about this, I said; but rather ask ourselves: Is the practise of virtue obligatory on the rich man, or can he live without it? And if obligatory on him, then let us raise a further question, whether this dieting of disorders, which is an impediment to the application of the mind in carpentering and the mechanical arts, does not equally stand in the way of the sentiment of Phocylides?

Of that, he replied, there can be no doubt; such excessive care of the body, when carried beyond the rules of gymnastics, is most inimical to the practice of virtue.

Yes, indeed, I replied, and equally incompatible with the management of a house, an army, or an office of state; and, what is most Important of all, irreconcileable with any kind of study or thought or selfreflection -- there is a constant suspicion that headache and giddiness are to be ascribed to philosophy, and hence all practising or making trial of virtue in the higher sense is absolutely stopped; for a man is always fancying that he is being made ill, and is in constant anxiety about the state of his body.

Yes, likely enough.

And therefore our politic Asclepius may be supposed to have exhibited the power of his art only to persons who, being generally of healthy constitution and habits of life, had a definite ailment; such as these he cured by purges and operations, and bade them live as usual, herein consulting the interests of the State; but bodies which disease had penetrated through and through he would not have attempted

to cure by gradual processes of evacuation and infusion: he did not want to lengthen out goodfornothing lives, or to have weak fathers begetting weaker sons; -- if a man was not able to live in the ordinary way he had no business to cure him; for such a cure would have been of no use either to himself, or to the State.

Then, he said, you regard Asclepius as a statesman.

Clearly; and his character is further illustrated by his sons. Note that they were heroes in the days of old and practised the medicines of which I am speaking at the siege of Troy: You will remember how, when Pandarus wounded Menelaus, they

"Sucked the blood out of the wound, and sprinkled soothing remedies,"

but they never prescribed what the patient was afterward to eat or drink in the case of Menelaus, any more than in the case of Eurypylus; the remedies, as they conceived, were enough to heal any man who before he was wounded was healthy and regular in his habits; and even though he did happen to drink a posset of Pramnian wine, he might get well all the same. But they would have nothing to do with unhealthy and intemperate subjects, whose lives were of no use either to themselves or others; the art of medicine was not designed for their good, and though they were as rich as Midas, the sons of Asclepius would have declined to attend them.

They were very acute persons, those sons of Asclepius.

Naturally so, I replied. Nevertheless, the tragedians and Pindar disobeying our behests, although they acknowledge that Asclepius was the son of Apollo, say also that he was bribed into healing a rich man who was at the point of death, and for this reason he was struck by lightning. But we, in accordance with the principle already affirmed by us, will not believe them when they tell us both; if he was the son of a god, we maintain that he was not avaricious; or, if he was avaricious, he was not the son of a god.

All that, Socrates, is excellent; but I should like to put a question to you: Ought there not to be good physicians in a State, and are not the best those who have treated the greatest number of constitutions, good and bad? and are not the best judges in like manner those who are acquainted with all sorts of moral natures?

Yes, I said, I too would have good judges and good physicians. But do you know whom I think good?

Will you tell me?

I will, if I can. Let me, however, note that in the same question you join two things which are not the same.

How so? he asked.

Why, I said, you join physicians and judges. Now the

most skilful physicians are those who, from their youth upward, have combined with the knowledge of their art the greatest experience of disease; they had better not be robust in health, and should have had all manner of diseases in their own persons. For the body, as I conceive, is not the instrument with which they cure the body; in that case we could not allow them ever to be or to have been sickly; but they cure the body with the mind, and the mind which has become and is sick can cure nothing.

That is very true, he said.

But with the judge it is otherwise; since he governs mind by mind; he ought not therefore to have been trained among vicious minds, and to have associated with them from youth upward, and to have gone through the whole calendar of crime, only in order that he may quickly infer the crimes of others as he might their bodily diseases from his own selfconsciousness; the honorable mind which is to form a healthy judgment should have had no experience or contamination of evil habits when young. And this is the reason why in youth good men often appear to be simple, and are easily practised upon by the dishonest, because they have no examples of what evil is in their own souls.

Yes, he said, they are far too apt to be deceived.

Therefore, I said, the judge should not be young; he should have learned to know evil, not from his own soul, but from late and long observation of the nature of evil in others: knowledge should be his guide, not personal experience.

Yes, he said, that is the ideal of a judge.

Yes, I replied, and he will be a good man (which is my answer to your question); for he is good who has a good soul. But the cunning and suspicious nature of which we spoke -- he who has committed many crimes, and fancies himself to be a master in wickedness -- when he is among his fellows, is wonderful in the precautions which he takes, because he judges of them by himself: but when he gets into the company of men of virtue, who have the experience of age, he appears to be a fool again, owing to his unseasonable suspicions; he cannot recognize an honest man, because he has no pattern of honesty in himself; at the same time, as the bad are more numerous than the good, and he meets with them oftener, he thinks himself, and is by others thought to be, rather wise than foolish.

Most true, he said.

Then the good and wise judge whom we are seeking is not this man, but the other; for vice cannot know virtue too, but a virtuous nature, educated by time, will acquire a knowledge both of virtue and vice: the virtuous, and not the vicious, man has wisdom -- in my opinion.

And in mine also.

This is the sort of medicine, and this is the sort of

law, which you will sanction in your State. They will minister to better natures, giving health both of soul and of body; but those who are diseased in their bodies they will leave to die, and the corrupt and incurable souls they will put an end to themselves.

That is clearly the best thing both for the patients and for the State.

And thus our youth, having been educated only in that simple music which, as we said, inspires temperance, will be reluctant to go to law.

Clearly.

And the musician, who, keeping to the same track, is content to practise the simple gymnastics, will have nothing to do with medicine unless in some extreme case.

That I quite believe.

The very exercises and toils which he undergoes are intended to stimulate the spirited element of his nature, and not to increase his strength; he will not, like common athletes, use exercise and regimen to develop his muscles.

Very right, he said.

Neither are the two arts of music and gymnastics really designed, as is often supposed, the one for the training of the soul, the other for the training of the body.

What then is the real object of them?

I believe, I said, that the teachers of both have in view chiefly the improvement of the soul.

How can that be? he asked.

Did you never observe, I said, the effect on the mind itself of exclusive devotion to gymnastics, or the opposite effect of an exclusive devotion to music?

In what way shown? he said.

The one producing a temper of hardness and ferocity, the other of softness and effeminacy, I replied.

Yes, he said, I am quite aware that the mere athlete becomes too much of a savage, and that the mere musician IS melted and softened beyond what is good for him.

Yet surely, I said, this ferocity only comes from spirit, which, if rightly educated, would give courage, but, if too much intensified, is liable to become hard and brutal.

That I quite think.

On the other hand the philosopher will have the quality of gentleness. And this also, when too much indulged, will

turn to softness, but, if educated rightly, will be gentle and moderate.

True.

And in our opinion the guardians ought to have both these qualities?

Assuredly.

And both should be in harmony?

Beyond question.

And the harmonious soul is both temperate and courageous?

Yes.

And the inharmonious is cowardly and boorish?

Very true.

And, when a man allows music to play upon him and to pour into his soul through the funnel of his ears those sweet and soft and melancholy airs of which we were just now speaking, and his whole life is passed in warbling and the delights of song; in the first stage of the process the passion or spirit which is in him is tempered like iron, and made useful, instead of brittle and useless. But, if he carries on the softening and soothing process, in the next stage he begins to melt and waste, until he has wasted away his spirit and cut out the sinews of his soul; and he becomes a feeble warrior.

Very true.

If the element of spirit is naturally weak in him the change is speedily accomplished, but if he have a good deal, then the power of music weakening the spirit renders him excitable; on the least provocation he flames up at once, and is speedily extinguished; instead of having spirit he grows irritable and passionate and is quite impractical.

Exactly.

And so in gymnastics, if a man takes violent exercise and is a great feeder, and the reverse of a great student of music and philosophy, at first the high condition of his body fills him with pride and spirit, and he becomes twice the man that he was.

Certainly.

And what happens? if he do nothing else, and holds no converse with the muses, does not even that intelligence which there may be in him, having no taste of any sort of learning or inquiry or thought or culture, grow feeble and dull and blind, his mind never waking up or receiving nourishment, and his senses not being purged of their mists?

True, he said.

And he ends by becoming a hater of philosophy, uncivilized, never using the weapon of persuasion -- he is like a wild beast, all violence and fierceness, and knows no other way of dealing; and he lives in all ignorance and evil conditions, and has no sense of propriety and grace.

That is quite true, he said.

And as there are two principles of human nature, one the spirited and the other the philosophical, some god, as I should say, has given mankind two arts answering to them (and only indirectly to the soul and body), in order that these two principles (like the strings of an instrument) may be relaxed or drawn tighter until they are duly harmonized.

That appears to be the intention.

And he who mingles music with gymnastics in the fairest proportions, and best attempers them to the soul, may be rightly called the true musician and harmonist in a far higher sense than the tuner of the strings.

You are quite right, Socrates.

And such a presiding genius will be always required in our State if the government is to last.

Yes, he will be absolutely necessary.

Such, then, are our principles of nurture and education: Where would be the use of going into further details about the dances of our citizens, or about their hunting and coursing, their gymnastic and equestrian contests? For these all follow the general principle, and having found that, we shall have no difficulty in discovering them.

I dare say that there will be no difficulty.

Very good, I said; then what is the next question? Must we not ask who are to be rulers and who subjects?

Certainly.

There can be no doubt that the elder must rule the younger.

Clearly.

And that the best of these must rule.

That is also clear.

Now, are not the best husbandmen those who are most devoted to husbandry?

Yes.

And as we are to have the best of guardians for our

city, must they not be those who have most the character of guardians?

Yes.

And to this end they ought to be wise and efficient, and to have a special care of the State?

True.

And a man will be most likely to care about that which he loves?

To be sure.

And he will be most likely to love that which he regards as having the same interests with himself, and that of which the good or evil fortune is supposed by him at any time most to affect his own?

Very true, he replied.

Then there must be a selection. Let us note among the guardians those who in their whole life show the greatest eagerness to do what is for the good of their country, and the greatest repugnance to do what is against her interests.

Those are the right men.

And they will have to be watched at every age, in order that we may see whether they preserve their resolution, and never, under the influence either of force or enchantment, forget or cast off their sense of duty to the State.

How cast off? he said.

I will explain to you, he replied. A resolution may go out of a man's mind either with his will or against his will; with his will when he gets rid of a falsehood and learns better, against his will whenever he is deprived of a truth.

I understand, he said, the willing loss of a resolution; the meaning of the unwilling I have yet to learn.

Why, I said, do you not see that men are unwillingly deprived of good, and willingly of evil? Is not to have lost the truth an evil, and to possess the truth a good? and you would agree that to conceive things as they are is to possess the truth?

Yes, he replied; I agree with you in thinking that mankind are deprived of truth against their will.

And is not this involuntary deprivation caused either by theft, or force, or enchantment?

Still, he replied, I do not understand you.

I fear that I must have been talking darkly, like the

tragedians. I only mean that some men are changed by persuasion and that others forget; argument steals away the hearts of one class, and time of the other; and this I call theft. Now you understand me?

Yes.

Those again who are forced, are those whom the violence of some pain or grief compels to change their opinion.

I understand, he said, and you are quite right.

And you would also acknowledge that the enchanted are those who change their minds either under the softer influence of pleasure, or the sterner influence of fear?

Yes, he said; everything that deceives may be said to enchant.

Therefore, as I was just now saying, we must inquire who are the best guardians of their own conviction that what they think the interest of the State is to be the rule of their lives. We must watch them from their youth upward, and make them perform actions in which they are most likely to forget or to be deceived, and he who remembers and is not deceived is to be selected, and he who fails in the trial is to be rejected. That will be the way?

Yes.

And there should also be toils and pains and conflicts prescribed for them, in which they will be made to give further proof of the same qualities.

Very right, he replied.

And then, I said, we must try them with enchantments -- that is the third sort of test -- and see what will be their behavior: like those who take colts amid noise and tumult to see if they are of a timid nature, so must we take our youth amid terrors of some kind, and again pass them into pleasures, and prove them more thoroughly than gold is proved in the furnace, that we may discover whether they are armed against all enchantments, and of a noble bearing always, good guardians of themselves and of the music which they have learned, and retaining under all circumstances a rhythmical and harmonious nature, such as will be most serviceable to the individual and to the State. And he who at every age, as boy and youth and in mature life, has come out of the trial victorious and pure, shall be appointed a ruler and guardian of the State; he shall be honored in life and death, and shall receive sepulture and other memorials of honor, the greatest that we have to give. But him who fails, we must reject. I am inclined to think that this is the sort of way in which our rulers and guardians should be chosen and appointed. I speak generally, and not with any pretension to exactness.

And, speaking generally, I agree with you, he said.

And perhaps the word "guardian" in the fullest sense

ought to be applied to this higher class only who preserve us against foreign enemies and maintain peace among our citizens at home, that the one may not have the will, or the others the power, to harm us. The young men whom we before called guardians may be more properly designated auxiliaries and supporters of the principles of the rulers.

I agree with you, he said.

How then may we devise one of those needful falsehoods of which we lately spoke -- just one royal lie which may deceive the rulers, if that be possible, and at any rate the rest of the city?

What sort of lie? he said.

Nothing new, I replied; only an old Phoenician tale of what has often occurred before now in other places (as the poets say, and have made the world believe), though not in our time, and I do not know whether such an event could ever happen again, or could now even be made probable, if it did.

How your words seem to hesitate on your lips!

You will not wonder, I replied, at my hesitation when you have heard.

Speak, he said, and fear not. Well, then, I will speak, although I really know not how to look you in the face, or in what words to utter the audacious fiction, which I propose to communicate gradually, first to the rulers, then to the soldiers, and lastly to the people. They are to be told that their youth was a dream, and the education and training which they received from us, an appearance only; in reality during all that time they were being formed and fed in the womb of the earth, where they themselves and their arms and appurtenances were manufactured; when they were completed, the earth, their mother, sent them up; and so, their country being their mother and also their nurse, they are bound to advise for her good, and to defend her against attacks, and her citizens they are to regard as children of the earth and their own brothers.

You had good reason, he said, to be ashamed of the lie which you were going to tell.

True, I replied, but there is more coming; I have only told you half. Citizens, we shall say to them in our tale, you are brothers, yet God has framed you differently. Some of you have the power of command, and in the composition of these he has mingled gold, wherefore also they have the greatest honor; others he has made of silver, to be auxiliaries; others again who are to be husbandmen and craftsmen he has composed of brass and iron; and the species will generally be preserved in the children. But as all are of the same original stock, a golden parent will sometimes have a silver son, or a silver parent a golden son. And God proclaims as a first principle to the rulers, and above all else, that there is nothing which they should so anxiously guard, or of which they are to be such good guardians, as of the purity of the race. They should observe what elements

mingle in their offspring; for if the son of a golden or silver parent has an admixture of brass and iron, then nature orders a transposition of ranks, and the eye of the ruler must not be pitiful toward the child because he has to descend in the scale and become a husbandman or artisan, just as there may be sons of artisans who having an admixture of gold or silver in them are raised to honor, and become guardians or auxiliaries. For an oracle says that when a man of brass or iron guards the State, it will be destroyed. Such is the tale; is there any possibility of making our citizens believe in it?

Not in the present generation, he replied; there is no way of accomplishing this; but their sons may be made to believe in the tale, and their sons' sons, and posterity after them.

I see the difficulty, I replied; yet the fostering of such a belief will make them care more for the city and for one another. Enough, however, of the fiction, which may now fly abroad upon the wings of rumor, while we arm our earthborn heroes, and lead them forth under the command of their rulers. Let them look round and select a spot whence they can best suppress insurrection, if any prove refractory within, and also defend themselves against enemies, who, like wolves, may come down on the fold from without; there let them encamp, and when they have encamped, let them sacrifice to the proper gods and prepare their dwellings.

Just so, he said.

And their dwellings must be such as will shield them against the cold of winter and the heat of summer.

I suppose that you mean houses, he replied.

Yes, I said; but they must be the houses of soldiers, and not of shopkeepers.

What is the difference? he said.

That I will endeavor to explain, I replied. To keep watchdogs, who, from want of discipline or hunger, or some evil habit or other, would turn upon the sheep and worry them, and behave not like dogs, but wolves, would be a foul and monstrous thing in a shepherd?

Truly monstrous, he said.

And therefore every care must be taken that our auxiliaries, being stronger than our citizens, may not grow to be too much for them and become savage tyrants instead of friends and allies?

Yes, great care should be taken.

And would not a really good education furnish the best safeguard?

But they are welleducated already, he replied.

I cannot be so confident, my dear Glaucon, I said; I am much more certain that they ought to be, and that true education, whatever that may be, will have the greatest tendency to civilize and humanize them in their relations to one another, and to those who are under their protection.

Very true, he replied.

And not only their education, but their habitations, and all that belongs to them, should be such as will neither impair their virtue as guardians, nor tempt them to prey upon the other citizens. Any man of sense must acknowledge that.

He must.

Then now let us consider what will be their way of life, if they are to realize our idea of them. In the first place, none of them should have any property of his own beyond what is absolutely necessary; neither should they have a private house or store closed against anyone who has a mind to enter; their provisions should be only such as are required by trained warriors, who are men of temperance and courage; they should agree to receive from the citizens a fixed rate of pay, enough to meet the expenses of the year and no more; and they will go to mess and live together like soldiers in a camp. Gold and silver we will tell them that they have from God; the diviner metal is within them, and they have therefore no need of the dross which is current among men, and ought not to pollute the divine by any such earthly admixture; for that commoner metal has been the source of many unholy deeds, but their own is undefiled. And they alone of all the citizens may not touch or handle silver or gold, or be under the same roof with them, or wear them, or drink from them. And this will be their salvation, and they will be the saviours of the State. But should they ever acquire homes or lands or moneys of their own, they will become good housekeepers and husbandmen instead of guardians, enemies and tyrants instead of allies of the other citizens; hating and being hated, plotting and being plotted against, they will pass their whole life in much greater terror of internal than of external enemies, and the hour of ruin, both to themselves and to the rest of the State, will be at hand. For all which reasons may we not say that thus shall our State be ordered, and that these shall be the regulations appointed by us for our guardians concerning their houses and all other matters?

Yes, said Glaucon.

* * * *

Book IV: Wealth, Poverty, And Virtue

(Adeimantus, Socrates.)

HERE Adeimantus interposed a question: How would you answer, Socrates, said he, if a person were to say that you are making these people miserable, and that they are the cause of their own unhappiness; the city in fact belongs to them, but they are none the better for it; whereas other men

acquire lands, and build large and handsome houses, and have everything handsome about them, offering sacrifices to the gods on their own account, and practising hospitality; moreover, as you were saying just now, they have gold and silver, and all that is usual among the favorites of fortune; but our poor citizens are no better than mercenaries who are quartered in the city and are always mounting guard?

Yes, I said; and you may add that they are only fed, and not paid in addition to their food, like other men; and therefore they cannot, if they would, take a journey of pleasure; they have no money to spend on a mistress or any other luxurious fancy, which, as the world goes, is thought to be happiness; and many other accusations of the same nature might be added.

But, said he, let us suppose all this to be included in the charge.

You mean to ask, I said, what will be our answer?

Yes.

If we proceed along the old path, my belief, I said, is that we shall find the answer. And our answer will be that, even as they are, our guardians may very likely be the happiest of men; but that our aim in founding the State was not the disproportionate happiness of any one class, but the greatest happiness of the whole; we thought that in a State which is ordered with a view to the good of the whole we should be most likely to find justice, and in the illordered State injustice: and, having found them, we might then decide which of the two is the happier. At present, I take it, we are fashioning the happy State, not piecemeal, or with a view of making a few happy citizens, but as a whole; and by and by we will proceed to view the opposite kind of State. Suppose that we were painting a statue, and someone came up to us and said: Why do you not put the most beautiful colors on the most beautiful parts of the body -- the eyes ought to be purple, but you have made them black -- to him we might fairly answer: Sir, you would not surely have us beautify the eyes to such a degree that they are no longer eyes; consider rather whether, by giving this and the other features their due proportion, we make the whole beautiful. And so I say to you, do not compel us to assign to the guardians a sort of happiness which will make them anything but guardians; for we too can clothe our husbandmen in royal apparel, and set crowns of gold on their heads, and bid them till the ground as much as they like, and no more. Our potters also might be allowed to repose on couches, and feast by the fireside, passing round the winecup, while their wheel is conveniently at hand, and working at pottery only as much as they like; in this way we might make every class happy -- and then, as you imagine, the whole State would be happy. But do not put this idea into our heads; for, if we listen to you, the husbandman will be no longer a husbandman, the potter will cease to be a potter, and no one will have the character of any distinct class in the State. Now this is not of much consequence where the corruption of society, and pretension to be what you are not, are confined

to cobblers; but when the guardians of the laws and of the government are only seeming and not real guardians, then see how they turn the State upside down; and on the other hand they alone have the power of giving order and happiness to the State. We mean our guardians to be true saviours and not the destroyers of the State, whereas our opponent is thinking of peasants at a festival, who are enjoying a life of revelry, not of citizens who are doing their duty to the State. But, if so, we mean different things, and he is speaking of something which is not a State. And therefore we must consider whether in appointing our guardians we would look to their greatest happiness individually, or whether this principle of happiness does not rather reside in the State as a whole. But if the latter be the truth, then the guardians and auxiliaries, and all others equally with them, must be compelled or induced to do their own work in the best way. And thus the whole State will grow up in a noble order, and the several classes will receive the proportion of happiness which nature assigns to them.

I think that you are quite right.

I wonder whether you will agree with another remark which occurs to me.

What may that be?

There seem to be two causes of the deterioration of the arts.

What are they?

Wealth, I said, and poverty.

How do they act?

The process is as follows: When a potter becomes rich, will he, think you, any longer take the same pains with his art?

Certainly not.

He will grow more and more indolent and careless?

Very true.

And the result will be that he becomes a worse potter?

Yes; he greatly deteriorates.

But, on the other hand, if he has no money, and cannot provide himself with tools or instruments, he will not work equally well himself, nor will he teach his sons or apprentices to work equally well.

Certainly not.

Then, under the influence either of poverty or of wealth, workmen and their work are equally liable to degenerate?

That is evident.

Here, then, is a discovery of new evils, I said, against which the guardians will have to watch, or they will creep into the city unobserved.

What evils?

Wealth, I said, and poverty; the one is the parent of luxury and indolence, and the other of meanness and viciousness, and both of discontent.

That is very true, he replied; but still I should like to know, Socrates, how our city will be able to go to war, especially against an enemy who is rich and powerful, if deprived of the sinews of war.

There would certainly be a difficulty, I replied, in going to war with one such enemy; but there is no difficulty where there are two of them.

How so? he asked.

In the first place, I said, if we have to fight, our side will be trained warriors fighting against an army of rich men.

That is true, he said.

And do you not suppose, Adeimantus, that a single boxer who was perfect in his art would easily be a match for two stout and welltodo gentlemen who were not boxers?

Hardly, if they came upon him at once.

What, not, I said, if he were able to run away and then turn and strike at the one who first came up? And supposing he were to do this several times under the heat of a scorching sun, might he not, being an expert, overturn more than one stout personage?

Certainly, he said, there would be nothing wonderful in that.

And yet rich men probably have a greater superiority in the science and practise of boxing than they have in military qualities.

Likely enough.

Then we may assume that our athletes will be able to fight with two or three times their own number?

I agree with you, for I think you right.

And suppose that, before engaging, our citizens send an embassy to one of the two cities, telling them what is the truth: Silver and gold we neither have nor are permitted to have, but you may; do you therefore come and help us in war, and take the spoils of the other city: Who, on hearing these words, would choose to fight against lean wiry dogs, rather

than, with the dogs on their side, against fat and tender sheep?

That is not likely; and yet there might be a danger to the poor State if the wealth of many States were to be gathered into one.

But how simple of you to use the term State at all of any but our own!

Why so?

You ought to speak of other States in the plural number; not one of them is a city, but many cities, as they say in the game. For indeed any city, however small, is in fact divided into two, one the city of the poor, the other of the rich; these are at war with one another; and in either there are many smaller divisions, and you would be altogether beside the mark if you treated them all as a single State. But if you deal with them as many, and give the wealth or power or persons of the one to the others, you will always have a great many friends and not many enemies. And your State, while the wise order which has now been prescribed continues to prevail in her, will be the greatest of States, I do not mean to say in reputation or appearance, but in deed and truth, though she number not more than 1,000 defenders. A single State which is her equal you will hardly find, either among Hellenes or barbarians, though many that appear to be as great and many times greater.

That is most true, he said.

And what, I said, will be the best limit for our rulers to fix when they are considering the size of the State and the amount of territory which they are to include, and beyond which they will not go?

What limit would you propose?

I would allow the State to increase so far as is consistent with unity; that, I think, is the proper limit.

Very good, he said.

Here then, I said, is another order which will have to be conveyed to our guardians: Let our city be accounted neither large nor small, but one and selfsufficing.

And surely, said he, this is not a very severe order which we impose upon them.

And the other, said I, of which we were speaking before is lighter still -- I mean the duty of degrading the offspring of the guardians when inferior, and of elevating into the rank of guardians the offspring of the lower classes, when naturally superior. The intention was, that, in the case of the citizens generally, each individual should be put to the use for which nature intended him, one to one work, and then every man would do his own business, and be one and not many; and so the whole city would be one and not many.

Yes, he said; that is not so difficult.

The regulations which we are prescribing, my good Adeimantus, are not, as might be supposed, a number of great principles, but trifles all, if care be taken, as the saying is, of the one great thing -- a thing, however, which I would rather call, not, great, but sufficient for our purpose.

What may that be? he asked.

Education, I said, and nurture: If our citizens are well educated, and grow into sensible men, they will easily see their way through all these, as well as other matters which I omit; such, for example, as marriage, the possession of women and the procreation of children, which will all follow the general principle that friends have all things in common, as the proverb says.

That will be the best way of settling them.

Also, I said, the State, if once started well, moves with accumulating force like a wheel. For good nurture and education implant good constitutions, and these good constitutions taking root in a good education improve more and more, and this improvement affects the breed in man as in other animals.

Very possibly, he said.

Then to sum up: This is the point to which, above all, the attention of our rulers should be directed -- that music and gymnastics be preserved in their original form, and no innovation made. They must do their utmost to maintain them intact. And when anyone says that mankind most regard

"The newest song which the singers have,"

they will be afraid that he may be praising, not new songs, but a new kind of song; and this ought not to be praised, or conceived to be the meaning of the poet; for any musical innovation is full of danger to the whole State, and ought to be prohibited. So Damon tells me, and I can quite believe him; he says that when modes of music change, the fundamental laws of the State always change with them.

Yes, said Adeimantus; and you may add my suffrage to Damon's and your own.

Then, I said, our guardians must lay the foundations of their fortress in music?

Yes, he said; the lawlessness of which you speak too easily steals in.

Yes, I replied, in the form of amusement; and at first sight it appears harmless.

Why, yes, he said, and there is no harm; were it not that little by little this spirit of license, finding a

home, imperceptibly penetrates into manners and customs; whence, issuing with greater force, it invades contracts between man and man, and from contracts goes on to laws and constitutions, in utter recklessness, ending at last, Socrates, by an overthrow of all rights, private as well as public.

Is that true? I said.

That is my belief, he replied.

Then, as I was saying, our youth should be trained from the first in a stricter system, for if amusements become lawless, and the youths themselves become lawless, they can never grow up into wellconducted and virtuous citizens.

Very true, he said.

And when they have made a good beginning in play, and by the help of music have gained the habit of good order, then this habit of order, in a manner how unlike the lawless play of the others! will accompany them in all their actions and be a principle of growth to them, and if there be any fallen places [a] [principle] in the State will raise them up again.

Very true, he said.

Thus educated, they will invent for themselves any lesser rules which their predecessors have altogether neglected.

What do you mean?

I mean such things as these: -- when the young are to be silent before their elders; how they are to show respect to them by standing and making them sit; what honor is due to parents; what garments or shoes are to be worn; the mode of dressing the hair; deportment and manners in general. You would agree with me?

Yes.

But there is, I think, small wisdom in legislating about such matters -- I doubt if it is ever done; nor are any precise written enactments about them likely to be lasting.

Impossible.

It would seem, Adeimantus, that the direction in which education starts a man, will determine his future life. Does not like always attract like?

To be sure.

Until some one rare and grand result is reached which may be good, and may be the reverse of good?

That is not to be denied.

And for this reason, I said, I shall not attempt to legislate further about them.

Naturally enough, he replied.

Well, and about the business of the agora, and the ordinary dealings between man and man, or again about agreements with artisans; about insult and injury, or the commencement of actions, and the appointment of juries, what would you say? there may also arise questions about any impositions and exactions of market and harbor dues which may be required, and in general about the regulations of markets, police, harbors, and the like.. But, O heavens! shall we condescend to legislate on any of these particulars?

I think, he said, that there is no need to impose laws about them on good men; what regulations are necessary they will find out soon enough for themselves.

Yes, I said, my friend, if God will only preserve to them the laws which we have given them.

And without divine help, said Adeimantus, they will go on forever making and mending the laws and their lives in the hope of attaining perfection.

You would compare them, I said, to those invalids who, having no selfrestraint, will not leave off their habits of intemperance?

Exactly.

Yes, I said; and what a delightful life they lead! they are always doctoring and increasing and complicating their disorders, and always fancying that they will be cured by any nostrum which anybody advises them to try.

Such cases are very common, he said, with invalids of this sort.

Yes, I replied; and the charming thing is that they deem him their worst enemy who tells them the truth, which is simply that, unless they give up eating and drinking and wenching and idling, nether drug nor cautery nor spell nor amulet nor any other remedy will avail.

Charming! he replied. I see nothing in going into a passion with a man who tells you what is right.

These gentlemen, I said, do not seem to be in your good graces.

Assuredly not.

Nor would you praise the behavior of States which act like the men whom I was just now describing. For are there not illordered States in which the citizens are forbidden under pain of death to alter the constitution; and yet he who most sweetly courts those who live under this regime and indulges them and fawns upon them and is skilful in

anticipating and gratifying their humors is held to be a great and good statesman -- do not these States resemble the persons whom I was describing?

Yes, he said; the States are as bad as the men; and I am very far from praising them.

But do you not admire, I said, the coolness and dexterity of these ready ministers of political corruption?

Yes, he said, I do; but not of all of them, for there are some whom the applause of the multitude has deluded into the belief that they are really statesmen, and these are not much to be admired.

What do you mean? I said; you should have more feeling for them. When a man cannot measure, and a great many others who cannot measure declare that he is four cubits high, can he help believing what they say?

Nay, he said, certainly not in that case.

Well, then, do not be angry with them; for are they not as good as a play, trying their hand at paltry reforms such as I was describing; they are always fancying that by legislation they will make an end of frauds in contracts, and the other rascalities which I was mentioning, not knowing that they are in reality cutting off the heads of a hydra?

Yes, he said; that is just what they are doing.

I conceive, I said, that the true legislator will not trouble himself with this class of enactments whether concerning laws or the constitution either in an illordered or in a wellordered State; for in the former they are quite useless, and in the latter there will be no difficulty in devising them; and many of them will naturally flow out of our previous regulations.

What, then, he said, is still remaining to us of the work of legislation?

Nothing to us, I replied; but to Apollo, the god of Delphi, there remains the ordering of the greatest and noblest and chiefest things of all.

Which are they? he said.

The institution of temples and sacrifices, and the entire service of gods, demigods, and heroes; also the ordering of the repositories of the dead, and the rites which have to be observed by him who would propitiate the inhabitants of the world below. These are matters of which we are ignorant ourselves, and as founders of a city we should be unwise in trusting them to any interpreter but our ancestral deity. He is the god who sits in the centre, on the navel of the earth, and he is the interpreter of religion to all mankind.

You are right, and we will do as you propose.

But where, amid all this, is justice? Son of Ariston, tell me where. Now that our city has been made habitable, light a candle and search, and get your brother and Polemarchus and the rest of our friends to help, and let us see where in it we can discover justice and where injustice, and in what they differ from one another, and which of them the man who would be happy should have for his portion, whether seen or unseen by gods and men.

Nonsense, said Glaucon: did you not promise to search yourself, saying that for you not to help justice in her need would be an impiety?

I do not deny that I said so; and as you remind me, I will be as good as my word; but you must join.

We will, he replied.

Well, then, I hope to make the discovery in this way: I mean to begin with the assumption that our State, if rightly ordered, is perfect.

That is most certain.

And being perfect, is therefore wise and valiant and temperate and just.

That is likewise clear.

And whichever of these qualities we find in the State, the one which is not found will be the residue?

Very good.

If there were four things, and we were searching for one of them, wherever it might be, the one sought for might be known to us from the first, and there would be no further trouble; or we might know the other three first, and then the fourth would clearly be the one left.

Very true, he said.

And is not a similar method to be pursued about the virtues, which are also four in number?

Clearly.

First among the virtues found in the State, wisdom comes into view, and in this I detect a certain peculiarity.

What is that?

The State which we have been describing is said to be wise as being good in counsel?

Very true.

And good counsel is clearly a kind of knowledge, for not by ignorance, but by knowledge, do men counsel well?

Clearly.

And the kinds of knowledge in a State are many and diverse?

Of course.

There is the knowledge of the carpenter; but is that the sort of knowledge which gives a city the title of wise and good in counsel?

Certainly not; that would only give a city the reputation of skill in carpentering.

Then a city is not to be called wise because possessing a knowledge which counsels for the best about wooden implements?

Certainly not.

Nor by reason of a knowledge which advises about brazen pots, he said, nor as possessing any other similar knowledge?

Not by reason of any of them, he said.

Nor yet by reason of a knowledge which cultivates the earth; that would give the city the name of agricultural?

Yes.

Well, I said, and is there any knowledge in our recently founded State among any of the citizens which advises, not about any particular thing in the State, but about the whole, and considers how a State can best deal with itself and with other States?

There certainly is.

And what is this knowledge, and among whom is it found? I asked.

It is the knowledge of the guardians, he replied, and is found among those whom we were just now describing as perfect guardians.

And what is the name which the city derives from the possession of this sort of knowledge?

The name of good in counsel and truly wise.

And will there be in our city more of these true guardians or more smiths?

The smiths, he replied, will be far more numerous.

Will not the guardians be the smallest of all the classes who receive a name from the profession of some kind of knowledge?

Much the smallest.

And so by reason of the smallest part or class, and of the knowledge which resides in this presiding and ruling part of itself, the whole State, being thus constituted according to nature, will be wise; and this, which has the only knowledge worthy to be called wisdom, has been ordained by nature to be of all classes the least.

Most true.

Thus, then, I said, the nature and place in the State of one of the four virtues have somehow or other been discovered.

And, in my humble opinion, very satisfactorily discovered, he replied.

Again, I said, there is no difficulty in seeing the nature of courage, and in what part that quality resides which gives the name of courageous to the State.

How do you mean?

Why, I said, everyone who calls any State courageous or cowardly, will be thinking of the part which fights and goes out to war on the State's behalf.

No one, he replied, would ever think of any other.

The rest of the citizens may be courageous or may be cowardly, but their courage or cowardice will not, as I conceive, have the effect of making the city either the one or the other.

Certainly not.

The city will be courageous in virtue of a portion of herself which preserves under all circumstances that opinion about the nature of things to be feared and not to be feared in which our legislator educated them; and this is what you term courage.

I should like to hear what you are saying once more, for I do not think that I perfectly understand you.

I mean that courage is a kind of salvation.

Salvation of what?

Of the opinion respecting things to be feared, what they are and of what nature, which the law implants through education; and I mean by the words "under all circumstances" to intimate that in pleasure or in pain, or under the influence of desire or fear, a man preserves, and does not lose this opinion. Shall I give you an illustration?

If you please.

You know, I said, that dyers, when they want to dye wool for making the true seapurple, begin by selecting their white color first; this they prepare and dress with much

care and pains, in order that the white ground may take the purple hue in full perfection. The dyeing then proceeds; and whatever is dyed in this manner becomes a fast color, and no washing either with lyes or without them can take away the bloom. But, when the ground has not been duly prepared, you will have noticed how poor is the look either of purple or of any other color.

Yes, he said; I know that they have a washedout and ridiculous appearance.

Then now, I said, you will understand what our object was in selecting our soldiers, and educating them in music and gymnastics; we were contriving influences which would prepare them to take the dye of the laws in perfection, and the color of their opinion about dangers and of every other opinion was to be indelibly fixed by their nurture and training, not to be washed away by such potent lyes as pleasure -- mightier agent far in washing the soul than any soda or lye; or by sorrow, fear, and desire, the mightiest of all other solvents. And this sort of universal saving power of true opinion in conformity with law about real and false dangers I call and maintain to be courage, unless you disagree.

But I agree, he replied; for I suppose that you mean to exclude mere uninstructed courage, such as that of a wild beast or of a slave -- this, in your opinion, is not the courage which the law ordains, and ought to have another name.

Most certainly.

Then I may infer courage to be such as you describe?

Why, yes, said I, you may, and if you add the words "of a citizen," you will not be far wrong -- hereafter, if you like, we will carry the examination further, but at present we are seeking, not for courage, but justice; and for the purpose of our inquiry we have said enough.

You are right, he replied.

Two virtues remain to be discovered in the State -- first, temperance, and then justice, which is the end of our search.

Very true.

Now, can we find justice without troubling ourselves about temperance?

I do not know how that can be accomplished, he said, nor do I desire that justice should be brought to light and temperance lost sight of; and therefore I wish that you would do me the favor of considering temperance first.

Certainly, I replied, I should not be justified in refusing your request.

Then consider, he said.

Yes, I replied; I will; and as far as I can at present see, the virtue of temperance has more of the nature of harmony and symphony than the preceding.

How so? he asked.

Temperance, I replied, is the ordering or controlling of certain pleasures and desires; this is curiously enough implied in the saying of "a man being his own master;" and other traces of the same notion may be found in language.

No doubt, he said.

There is something ridiculous in the expression "master of himself;" for the master is also the servant and the servant the master; and in all these modes of speaking the same person is denoted.

Certainly.

The meaning is, I believe, that in the human soul there is a better and also a worse principle; and when the better has the worse under control, then a man is said to be master of himself; and this is a term of praise: but when, owing to evil education or association, the better principle, which is also the smaller, is overwhelmed by the greater mass of the worse -- in this case he is blamed and is called the slave of self and unprincipled.

Yes, there is reason in that.

And now, I said, look at our newly created State, and there you will find one of these two conditions realized; for the State, as you will acknowledge, may be justly called master of itself, if the words "temperance" and "selfmastery" truly express the rule of the better part over the worse.

Yes, he said, I see that what you say is true.

Let me further note that the manifold and complex pleasures and desires and pains are generally found in children and women and servants, and in the freemen so called who are of the lowest and more numerous class.

Certainly, he said.

Whereas the simple and moderate desires which follow reason, and are under the guidance of mind and true opinion, are to be found only in a few, and those the best born and best educated.

Very true. These two, as you may perceive, have a place in our State; and the meaner desires of the many are held down by the virtuous desires and wisdom of the few.

That I perceive, he said.

Then if there be any city which may be described as master of its own pleasures and desires, and master of

itself, ours may claim such a designation?

Certainly, he replied.

It may also be called temperate, and for the same reasons?

Yes.

And if there be any State in which rulers and subjects will be agreed as to the question who are to rule, that again will be our State?

Undoubtedly.

And the citizens being thus agreed among themselves, in which class will temperance be found -- in the rulers or in the subjects?

In both, as I should imagine, he replied.

Do you observe that we were not far wrong in our guess that temperance was a sort of harmony?

Why so?

Why, because temperance is unlike courage and wisdom, each of which resides in a part only, the one making the State wise and the other valiant; not so temperance, which extends to the whole, and runs through all the notes of the scale, and produces a harmony of the weaker and the stronger and the middle class, whether you suppose them to be stronger or weaker in wisdom, or power, or numbers, or wealth, or anything else. Most truly then may we deem temperance to be the agreement of the naturally superior and inferior, as to the right to rule of either, both in States and individuals.

I entirely agree with you.

And so, I said, we may consider three out of the four virtues to have been discovered in our State. The last of those qualities which make a State virtuous must be justice, if we only knew what that was.

The inference is obvious.

The time then has arrived, Glaucon, when, like huntsmen, we should surround the cover, and look sharp that justice does not steal away, and pass out of sight and escape us; for beyond a doubt she is somewhere in this country: watch therefore and strive to catch a sight of her, and if you see her first, let me know.

Would that I could! but you should regard me rather as a follower who has just eyes enough to see what you show him -- that is about as much as I am good for.

Offer up a prayer with me and follow.

I will, but you must show me the way.

Here is no path, I said, and the wood is dark and perplexing; still we must push on.

Let us push on.

Here I saw something: Halloo! I said, I begin to perceive a track, and I believe that the quarry will not escape.

Good news, he said.

Truly, I said, we are stupid fellows.

Why so?

Why, my good sir, at the beginning of our inquiry, ages ago, there was Justice tumbling out at our feet, and we never saw her; nothing could be more ridiculous. Like people who go about looking for what they have in their hands -- that was the way with us -- we looked not at what we were seeking, but at what was far off in the distance; and therefore, I suppose, we missed her.

What do you mean?

I mean to say that in reality for a long time past we have been talking of Justice, and have failed to recognize her.

I grow impatient at the length of your exordium. Well, then, tell me, I said, whether I am right or not: You remember the original principle which we were always laying down at the foundation of the State, that one man should practise one thing only, the thing to which his nature was best adapted; now justice is this principle or a part of it.

Yes, we often said that one man should do one thing only.

Further, we affirmed that Justice was doing one's own business, and not being a busybody; we said so again and again, and many others have said the same to us.

Yes, we said so.

Then to do one's own business in a certain way may be assumed to be justice. Can you tell me whence I derive this inference?

I cannot, but I should like to be told.

Because I think that this is the only virtue which remains in the State when the other virtues of temperance and courage and wisdom are abstracted; and, that this is the ultimate cause and condition of the existence of all of them, and while remaining in them is also their preservative; and we were saying that if the three were discovered by us, justice would be the fourth, or remaining one.

That follows of necessity.

If we are asked to determine which of these four qualities by its presence contributes most to the excellence of the State, whether the agreement of rulers and subjects, or the preservation in the soldiers of the opinion which the law ordains about the true nature of dangers, or wisdom and watchfulness in the rulers, or whether this other which I am mentioning, and which is found in children and women, slave and freeman, artisan, ruler, subject -- the quality, I mean, of everyone doing his own work, and not being a busybody, would claim the palm -- the question is not so easily answered.

Certainly, he replied, there would be a difficulty in saying which.

Then the power of each individual in the State to do his own work appears to compete with the other political virtues, wisdom, temperance, courage.

Yes, he said.

And the virtue which enters into this competition is justice?

Exactly.

Let us look at the question from another point of view: Are not the rulers in a State those to whom you would intrust the office of determining suitsatlaw?

Certainly.

And are suits decided on any other ground but that a man may neither take what is another's, nor be deprived of what is his own?

Yes; that is their principle.

Which is a just principle?

Yes.

Then on this view also justice will be admitted to be the having and doing what is a man's own, and belongs to him?

Very true.

Think, now, and say whether you agree with me or not. Suppose a carpenter to be doing the business of a cobbler, or a cobbler of a carpenter; and suppose them to exchange their implements or their duties, or the same person to be doing the work of both, or whatever be the change; do you think that any great harm would result to the State?

Not much.

But when the cobbler or any other man whom nature designed to be a trader, having his heart lifted up by

wealth or strength or the number of his followers, or any like advantage, attempts to force his way into the class of warriors, or a warrior into that of legislators and guardians, for which he is unfitted, and either to take the implements or the duties of the other; or when one man is trader, legislator, and warrior all in one, then I think you will agree with me in saying that this interchange and this meddling of one with another is the ruin of the State.

Most true. Seeing, then, I said, that there are three distinct classes, any meddling of one with another, or the change of one into another, is the greatest harm to the State, and may be most justly termed evildoing?

Precisely.

And the greatest degree of evildoing to one's own city would be termed by you injustice?

Certainly. This, then, is injustice; and on the other hand when the trader, the auxiliary, and the guardian each do their own business, that is justice, and will make the city just.

I agree with you.

We will not, I said, be overpositive as yet; but if, on trial, this conception of justice be verified in the individual as well as in the State, there will be no longer any room for doubt; if it be not verified, we must have a fresh inquiry. First let us complete the old investigation, which we began, as you remember, under the impression that, if we could previously examine justice on the larger scale, there would be less difficulty in discerning her in the individual. That larger example appeared to be the State, and accordingly we constructed as good a one as we could, knowing well that in the good State justice would be found. Let the discovery which we made be now applied to the individual -- if they agree, we shall be satisfied; or, if there be a difference in the individual, we will come back to the State and have another trial of the theory. The friction of the two when rubbed together may possibly strike a light in which justice will shine forth, and the vision which is then revealed we will fix in our souls.

That will be in regular course; let us do as you say.

I proceeded to ask: When two things, a greater and less, are called by the same name, are they like or unlike in so far as they are called the same?

Like, he replied.

The just man then, if we regard the idea of justice only, will be like the just State?

He will.

And a State was thought by us to be just when the three classes in the State severally did their own business; and also thought to be temperate and valiant and wise by reason

of certain other affections and qualities of these same classes?

True, he said.

And so of the individual; we may assume that he has the same three principles in his own soul which are found in the State; and he may be rightly described in the same terms, because he is affected in the same manner?

Certainly, he said.

Once more, then, O my friend, we have alighted upon an easy question -- whether the soul has these three principles or not?

An easy question! Nay, rather, Socrates, the proverb holds that hard is the good.

Very true, I said; and I do not think that the method which we are employing is at all adequate to the accurate solution of this question; the true method is another and a longer one. Still we may arrive at a solution not below the level of the previous inquiry.

May we not be satisfied with that? he said; under the circumstances, I am quite content. I, too, I replied, shall be extremely well satisfied.

Then faint not in pursuing the speculation, he said.

Must we not acknowledge, I said, that in each of us there are the same principles and habits which there are in the State; and that from the individual they pass into the State? -- how else can they come there? Take the quality of passion or spirit; it would be ridiculous to imagine that this quality, when found in States, is not derived from the individuals who are supposed to possess it, e.g., the Thracians, Scythians, and in general the Northern nations; and the same may be said of the love of knowledge, which is the special characteristic of our part of the world, or of the love of money, which may, with equal truth, be attributed to the Phoenicians and Egyptians.

Exactly so, he said.

There is no difficulty in understanding this.

None whatever.

But the question is not quite so easy when we proceed to ask whether these principles are three or one; whether, that is to say, we learn with one part of our nature, are angry with another, and with a third part desire the satisfaction of our natural appetites; or whether the whole soul comes into play in each sort of action -- to determine that is the difficulty.

Yes, he said; there lies the difficulty.

Then let us now try and determine whether they are the

same or different.

How can we? he asked.

I replied as follows: The same thing clearly cannot act or be acted upon in the same part or in relation to the same thing at the same time, in contrary ways; and therefore whenever this contradiction occurs in things apparently the same, we know that they are really not the same, but different.

Good.

For example, I said, can the same thing be at rest and in motion at the same time in the same part?

Impossible.

Still, I said, let us have a more precise statement of terms, lest we should hereafter fall out by the way. Imagine the case of a man who is standing and also moving his hands and his head, and suppose a person to say that one and the same person is in motion and at rest at the same moment -- to such a mode of speech we should object, and should rather say that one part of him is in motion while another is at rest.

Very true.

And suppose the objector to refine still further, and to draw the nice distinction that not only parts of tops, but whole tops, when they spin round with their pegs fixed on the spot, are at rest and in motion at the same time (and he may say the same of anything which revolves in the same spot), his objection would not be admitted by us, because in such cases things are not at rest and in motion in the same parts of themselves; we should rather say that they have both an axis and a circumference; and that the axis stands still, for there is no deviation from the perpendicular; and that the circumference goes round. But if, while revolving, the axis inclines either to the right or left, forward or backward, then in no point of view can they be at rest.

That is the correct mode of describing them, he replied.

Then none of these objections will confuse us, or incline us to believe that the same thing at the same time, in the same part or in relation to the same thing, can act or be acted upon in contrary ways.

Certainly not, according to my way of thinking.

Yet, I said, that we may not be compelled to examine all such objections, and prove at length that they are untrue, let us assume their absurdity, and go forward on the understanding that hereafter, if this assumption turn out to be untrue, all the consequences which follow shall be withdrawn.

Yes, he said, that will be the best way.

Well, I said, would you not allow that assent and dissent, desire and aversion, attraction and repulsion, are all of them opposites, whether they are regarded as active or passive (for that makes no difference in the fact of their opposition)?

Yes, he said, they are opposites.

Well, I said, and hunger and thirst, and the desires in general, and again willing and wishing -- all these you would refer to the classes already mentioned. You would say -- would you not? -- that the soul of him who desires is seeking after the object of his desire; or that he is drawing to himself the thing which he wishes to possess: or again, when a person wants anything to be given him, his mind, longing for the realization of his desire, intimates his wish to have it by a nod of assent, as if he had been asked a question?

Very true.

And what would you say of unwillingness and dislike and the absence of desire; should not these be referred to the opposite class of repulsion and rejection?

Certainly.

Admitting this to be true of desire generally, let us suppose a particular class of desires, and out of these we will select hunger and thirst, as they are termed, which are the most obvious of them?

Let us take that class, he said.

The object of one is food, and of the other drink?

Yes.

And here comes the point: is not thirst the desire which the soul has of drink, and of drink only; not of drink qualified by anything else; for example, warm or cold, or much or little, or, in a word, drink of any particular sort: but if the thirst be accompanied by heat, then the desire is of cold drink; or, if accompanied by cold, then of warm drink; or, if the thirst be excessive, then the drink which is desired will be excessive; or, if not great, the quantity of drink will also be small: but thirst pure and simple will desire drink pure and simple, which is the natural satisfaction of thirst, as food is of hunger?

Yes, he said; the simple desire is, as you say, in every case of the simple object, and the qualified desire of the qualified object.

But here a confusion may arise; and I should wish to guard against an opponent starting up and saying that no man desires drink only, but good drink, or food only, but good food; for good is the universal object of desire, and thirst being a desire, will necessarily be thirst after good drink; and the same is true of every other desire.

Yes, he replied, the opponent might have something to say.

Nevertheless I should still maintain, that of relatives some have a quality attached to either term of the relation; others are simple and have their correlatives simple.

I do not know what you mean.

Well, you know of course that the greater is relative to the less?

Certainly.

And the much greater to the much less?

Yes.

And the sometime greater to the sometime less, and the greater that is to be to the less that is to be?

Certainly, he said.

And so of more or less, and of other correlative terms, such as the double and the half, or, again, the heavier and the lighter, the swifter and the slower; and of hot and cold, and of any other relatives; is not this true of all of them?

Yes.

And does not the same principle hold in the sciences? The object of science is knowledge (assuming that to be the true definition), but the object of a particular science is a particular kind of knowledge; I mean, for example, that the science of housebuilding is a kind of knowledge which is defined and

distinguished from other kinds and is therefore termed architecture.

Certainly.

Because it has a particular quality which no other has?

Yes.

And it has this particular quality because it has an object of a particular kind; and this is true of the other arts and sciences?

Yes.

Now, then, if I have made myself clear, you will understand my original meaning in what I said about relatives. My meaning was, that if one term of a relation is taken alone, the other is taken alone; if one term is qualified, the other is also qualified. I do not mean to say that relatives may not be disparate, or that the science of health is healthy, or of disease necessarily diseased, or

that the sciences of good and evil are therefore good and evil; but only that, when the term "science" is no longer used absolutely, but has a qualified object which in this case is the nature of health and disease, it becomes defined, and is hence called not merely science, but the science of medicine.

I quite understand, and, I think, as you do.

Would you not say that thirst is one of these essentially relative terms, having clearly a relation --

Yes, thirst is relative to drink.

And a certain kind of thirst is relative to a certain kind of drink; but thirst taken alone is neither of much nor little, nor of good nor bad, nor of any particular kind of drink, but of drink only?

Certainly.

Then the soul of the thirsty one, in so far as he is thirsty, desires only drink; for this he yearns and tries to obtain it?

That is plain.

And if you suppose something which pulls a thirsty soul away from drink, that must be different from the thirsty principle which draws him like a beast to drink; for, as we were saying, the same thing cannot at the same time with the same part of itself act in contrary ways about the same.

Impossible.

No more than you can say that the hands of the archer push and pull the bow at the same time, but what you say is that one hand pushes and the other pulls.

Exactly so, he replied.

And might a man be thirsty, and yet unwilling to drink?

Yes, he said, it constantly happens.

And in such a case what is one to say? Would you not say that there was something in the soul bidding a man to drink, and something else forbidding him, which is other and stronger than the principle which bids him?

I should say so.

And the forbidding principle is derived from reason, and that which bids and attracts proceeds from passion and disease?

Clearly.

Then we may fairly assume that they are two, and that they differ from one another; the one with which a man reasons, we may call the rational principle of the soul; the

other, with which he loves, and hungers, and thirsts, and feels the flutterings of any other desire, may be termed the irrational or appetitive, the ally of sundry pleasures and satisfactions?

Yes, he said, we may fairly assume them to be different.

Then let us finally determine that there are two principles existing in the soul. And what of passion, or spirit? Is it a third, or akin to one of the preceding?

I should be inclined to say -- akin to desire.

Well, I said, there is a story which I remember to have heard, and in which I put faith. The story is, that Leontius, the son of Aglaion, coming up one day from the Piraeus, under the north wall on the outside, observed some dead bodies lying on the ground at the place of execution. He felt a desire to see them, and also a dread and abhorrence of them; for a time he struggled and covered his eyes, but at length the desire got the better of him; and forcing them open, he ran up to the dead bodies, saying, Look, ye wretches, take your fill of the fair sight.

I have heard the story myself, he said.

The moral of the tale is, that anger at times goes to war with desire, as though they were two distinct things.

Yes; that is the meaning, he said.

And are there not many other cases in which we observe that when a man's desires violently prevail over his reason, he reviles himself, and is angry at the violence within him, and that in this struggle, which is like the struggle of factions in a State, his spirit is on the side of his reason; but for the passionate or spirited element to take part with the desires when reason decides that she should not be opposed, is a sort of thing which I believe that you never observed occurring in yourself, nor, as I should imagine, in anyone else?

Certainly not.

Suppose that a man thinks he has done a wrong to another, the nobler he is, the less able is he to feel indignant at any suffering, such as hunger, or cold, or any other pain which the injured person may inflict upon him -- these he deems to be just, and, as I say, his anger refuses to be excited by them.

True, he said.

But when he thinks that he is the sufferer of the wrong, then he boils and chafes, and is on the side of what he believes to be justice; and because he suffers hunger or cold or other pain he is only the more determined to persevere and conquer. His noble spirit will not be quelled until he either slays or is slain; or until he hears the voice of the shepherd, that is, reason, bidding his dog bark

no more.

The illustration is perfect, he replied; and in our State, as we were saying, the auxiliaries were to be dogs, and to hear the voice of the rulers, who are their shepherds.

I perceive, I said, that you quite understand me; there is, however, a further point which I wish you to consider.

What point?

You remember that passion or spirit appeared at first sight to be a kind of desire, but now we should say quite the contrary; for in the conflict of the soul spirit is arrayed on the side of the rational principle.

Most assuredly.

But a further question arises: Is passion different from reason also, or only a kind of reason; in which latter case, instead of three principles in the soul, there will only be two, the rational and the concupiscent; or rather, as the State was composed of three classes, traders, auxiliaries, counsellors, so may there not be in the individual soul a third element which is passion or spirit, and when not corrupted by bad education is the natural auxiliary of reason?

Yes, he said, there must be a third.

Yes, I replied, if passion, which has already been shown to be different from desire, turn out also to be different from reason.

But that is easily proved: We may observe even in young children that they are full of spirit almost as soon as they are born, whereas some of them never seem to attain to the use of reason, and most of them late enough.

Excellent, I said, and you may see passion equally in brute animals, which is a further proof of the truth of what you are saying. And we may once more appeal to the words of Homer, which have been already quoted by us,

"He smote his breast, and thus rebuked his soul;" for in this verse Homer has clearly supposed the power which reasons about the better and worse to be different from the unreasoning anger which is rebuked by it.

Very true, he said.

And so, after much tossing, we have reached land, and are fairly agreed that the same principles which exist in the State exist also in the individual, and that they are three in number.

Exactly.

Must we not then infer that the individual is wise in the same way, and in virtue of the same quality which makes

the State wise?

Certainly.

Also that the same quality which constitutes courage in the State constitutes courage in the individual, and that both the State and the individual bear the same relation to all the other virtues?

Assuredly.

And the individual will be acknowledged by us to be just in the same way in which the State is just?

That follows of course.

We cannot but remember that the justice of the State consisted in each of the three classes doing the work of its own class?

We are not very likely to have forgotten, he said.

We must recollect that the individual in whom the several qualities of his nature do their own work will be just, and will do his own work?

Yes, he said, we must remember that too.

And ought not the rational principle, which is wise, and has the care of the whole soul, to rule, and the passionate or spirited principle to be the subject and ally?

Certainly.

And, as we were saying, the united influence of music and gymnastics will bring them into accord, nerving and sustaining the reason with noble words and lessons, and moderating and soothing and civilizing the wildness of passion by harmony and rhythm?

Quite true, he said.

And these two, thus nurtured and educated, and having learned truly to know their own functions, will rule over the concupiscent, which in each of us is the largest part of the soul and by nature most insatiable of gain; over this they will keep guard, lest, waxing great and strong with the fulness of bodily pleasures, as they are termed, the concupiscent soul, no longer confined to her own sphere, should attempt to enslave and rule those who are not her naturalborn subjects, and overturn the whole life of man?

Very true, he said.

Both together will they not be the best defenders of the whole soul and the whole body against attacks from without; the one counselling, and the other fighting under his leader, and courageously executing his commands and counsels?

True.

And he is to be deemed courageous whose spirit retains in pleasure and in pain the commands of reason about what he ought or ought not to fear?

Right, he replied.

And him we call wise who has in him that little part which rules, and which proclaims these commands; that part too being supposed to have a knowledge of what is for the interest of each of the three parts and of the whole?

Assuredly.

And would you not say that he is temperate who has these same elements in friendly harmony, in whom the one ruling principle of reason, and the two subject ones of spirit and desire, are equally agreed that reason ought to rule, and do not rebel?

Certainly, he said, that is the true account of temperance whether in the State or individual.

And surely, I said, we have explained again and again how and by virtue of what quality a man will be just.

That is very certain.

And is justice dimmer in the individual, and is her form different, or is she the same which we found her to be in the State?

There is no difference, in my opinion, he said.

Because, if any doubt is still lingering in our minds, a few commonplace instances will satisfy us of the truth of what I am saying.

What sort of instances do you mean?

If the case is put to us, must we not admit that the just State, or the man who is trained in the principles of such a State, will be less likely than the unjust to make away with a deposit of gold or silver? Would anyone deny this?

No one, he replied.

Will the just man or citizen ever be guilty of sacrilege or theft, or treachery either to his friends or to his country?

Never.

Neither will he ever break faith where there have been oaths or agreements.

Impossible.

No one will be less likely to commit adultery, or to dishonor his father and mother, or to fail in his religious

duties?

No one.

And the reason is that each part of him is doing its own business, whether in ruling or being ruled?

Exactly so.

Are you satisfied, then, that the quality which makes such men and such States is justice, or do you hope to discover some other?

Not I, indeed.

Then our dream has been realized; and the suspicion which we entertained at the beginning of our work of construction, that some divine power must have conducted us to a primary form of justice, has now been verified?

Yes, certainly.

And the division of labor which required the carpenter and the shoemaker and the rest of the citizens to be doing each his own business, and not another's, was a shadow of justice, and for that reason it was of use?

Clearly.

But in reality justice was such as we were describing, being concerned, however, not with the outward man, but with the inward, which is the true self and concernment of man: for the just man does not permit the several elements within him to interfere with one another, or any of them to do the work of others -- he sets in order his own inner life, and is his own master and his own law, and at peace with himself; and when he has bound together the three principles within him, which may be compared to the higher, lower, and middle notes of the scale, and the intermediate intervals -- when he has bound all these together, and is no longer many, but has become one entirely temperate and perfectly adjusted nature, then he proceeds to act, if he has to act, whether in a matter of property, or in the treatment of the body, or in some affair of politics or private business; always thinking and calling that which preserves and cooperates with this harmonious condition just and good action, and the knowledge which presides over it wisdom, and that which at any time impairs this condition he will call unjust action, and the opinion which presides over it ignorance.

You have said the exact truth, Socrates.

Very good; and if we were to affirm that we had discovered the just man and the just State, and the nature of justice in each of them, we should not be telling a falsehood?

Most certainly not.

May we say so, then?

Let us say so.

And now, I said, injustice has to be considered.

Clearly.

Must not injustice be a strife which arises among the three principles -- a meddlesomeness, and interference, and rising up of a part of the soul against the whole, an assertion of unlawful authority, which is made by a rebellious subject against a true prince, of whom he is the natural vassal -- what is all this confusion and delusion but injustice, and intemperance, and cowardice, and ignorance, and every form of vice?

Exactly so.

And if the nature of justice and injustice be known, then the meaning of acting unjustly and being unjust, or, again, of acting justly, will also be perfectly clear?

What do you mean? he said.

Why, I said, they are like disease and health; being in the soul just what disease and health are in the body.

How so? he said.

Why, I said, that which is healthy causes health, and that which is unhealthy causes disease.

Yes.

And just actions cause justice, and unjust actions cause injustice?

That is certain.

And the creation of health is the institution of a natural order and government of one by another in the parts of the body; and the creation of disease is the production of a state of things at variance with this natural order?

True.

And is not the creation of justice the institution of a natural order and government of one by another in the parts of the soul, and the creation of injustice the production of a state of things at variance with the natural order?

Exactly so, he said.

Then virtue is the health, and beauty, and wellbeing of the soul, and vice the disease, and weakness, and deformity, of the same?

True.

And do not good practices lead to virtue, and evil practices to vice?

Assuredly.

Still our old question of the comparative advantage of justice and injustice has not been answered: Which is the more profitable, to be just and act justly and practise virtue, whether seen or unseen of gods and men, or to be unjust and act unjustly, if only unpunished and unreformed?

In my judgment, Socrates, the question has now become ridiculous. We know that, when the bodily constitution is gone, life is no longer endurable, though pampered with all kinds of meats and drinks, and having all wealth and all power; and shall we be told that when the very essence of the vital principle is undermined and corrupted, life is still worth having to a man, if only he be allowed to do whatever he likes with the single exception that he is not to acquire justice and virtue, or to escape from injustice and vice; assuming them both to be such as we have described?

Yes, I said, the question is, as you say, ridiculous. Still, as we are near the spot at which we may see the truth in the clearest manner with our own eyes, let us not faint by the way.

Certainly not, he replied.

Come up hither, I said, and behold the various forms of vice, those of them, I mean, which are worth looking at.

I am following you, he replied: proceed.

I said: The argument seems to have reached a height from which, as from some tower of speculation, a man may look down and see that virtue is one, but that the forms of vice are innumerable; there being four special ones which are deserving of note.

What do you mean? he said.

I mean, I replied, that there appear to be as many forms of the soul as there are distinct forms of the State.

How many?

There are five of the State, and five of the soul, I said.

What are they?

The first, I said, is that which we have been describing, and which may be said to have two names, monarchy and aristocracy, according as rule is exercised by one distinguished man or by many.

True, he replied.

But I regard the two names as describing one form only; for whether the government is in the hands of one or many, if the governors have been trained in the manner which we have supposed, the fundamental laws of the State will be

maintained.

That is true, he replied.

* * * *

Book: On Matrimony And Philosophy

(Socrates, Glaucon, Adeimantus.)

SUCH is the good and true City or State, and the good and true man is of the same pattern; and if this is right every other is wrong; and the evil is one which affects not only the ordering of the State, but also the regulation of the individual soul, and is exhibited in four forms.

What are they? he said.

I was proceeding to tell the order in which the four evil forms appeared to me to succeed one another, when Polemarchus, who was sitting a little way off, just beyond Adeimantus, began to whisper to him: stretching forth his hand, he took hold of the upper part of his coat by the shoulder, and drew him toward him, leaning forward himself so as to be quite close and saying something in his ear, of which I only caught the words, "Shall we let him off, or what shall we do?"

Certainly not, said Adeimantus, raising his voice.

Who is it, I said, whom you are refusing to let off?

You, he said.

I repeated, Why am I especially not to be let off?

Why, he said, we think that you are lazy, and mean to cheat us out of a whole chapter which is a very important part of the story; and you fancy that we shall not notice your airy way of proceeding; as if it were selfevident to everybody, that in the matter of women and children "friends have all things in common."

And was I not right, Adeimantus?

Yes, he said; but what is right in this particular case, like everything else, requires to be explained; for community may be of many kinds. Please, therefore, to say what sort of community you mean. We have been long expecting that you would tell us something about the family life of your citizens -- how they will bring children into the world, and rear them when they have arrived, and, in general, what is the nature of this community of women and children -- for we are of opinion that the right or wrong management of such matters will have a great and paramount influence on the State for good or for evil. And now, since the question is still undetermined, and you are taking in hand another State, we have resolved, as you heard, not to let you go until you give an account of all this.

To that resolution, said Glaucon, you may regard me as

saying: Agreed.

And without more ado, said Thrasymachus, you may consider us all to be equally agreed.

I said, You know not what you are doing in thus assailing me: What an argument are you raising about the State! Just as I thought that I had finished, and was only too glad that I had laid this question to sleep, and was reflecting how fortunate I was in your acceptance of what I then said, you ask me to begin again at the very foundation, ignorant of what a hornet's nest of words you are stirring. Now I foresaw this gathering trouble, and avoided it.

For what purpose do you conceive that we have come here, said Thrasymachus -- to look for gold, or to hear discourse?

Yes, but discourse should have a limit.

Yes, Socrates, said Glaucon, and the whole of life is the only limit which wise men assign to the hearing of such discourses. But never mind about us; take heart yourself and answer the question in your own way: What sort of community of women and children is this which is to prevail among our guardians? and how shall we manage the period between birth and education, which seems to require the greatest care? Tell us how these things will be.

Yes, my simple friend, but the answer is the reverse of easy; many more doubts arise about this than about our previous conclusions. For the practicability of what is said may be doubted; and looked at in another point of view, whether the scheme, if ever so practicable, would be for the best, is also doubtful. Hence I feel a reluctance to approach the subject, lest our aspiration, my dear friend, should turn out to be a dream only.

Fear not, he replied, for your audience will not be hard upon you; they are not sceptical or hostile.

I said: My good friend, I suppose that you mean to encourage me by these words.

Yes, he said.

Then let me tell you that you are doing just the reverse; the encouragement which you offer would have been all very well had I myself believed that I knew what I was talking about. To declare the truth about matters of high interest which a man honors and loves, among wise men who love him, need occasion no fear or faltering in his mind; but to carry on an argument when you are yourself only a hesitating inquirer, which is my condition, is a dangerous and slippery thing; and the danger is not that I shall be laughed at (of which the fear would be childish), but that I shall miss the truth where I have most need to be sure of my footing, and drag my friends after me in my fall. And I pray Nemesis not to visit upon me the words which I am going to utter. For I do indeed believe that to be an involuntary homicide is a less crime than to be a deceiver about beauty,

or goodness, or justice, in the matter of laws. And that is a risk which I would rather run among enemies than among friends; and therefore you do well to encourage me.

Glaucon laughed and said: Well, then, Socrates, in case you and your argument do us any serious injury you shall be acquitted beforehand of the homicide, and shall not be held to be a deceiver; take courage then and speak.

Well, I said, the law says that when a man is acquitted he is free from guilt, and what holds at law may hold in argument.

Then why should you mind?

Well, I replied, I suppose that I must retrace my steps and say what I perhaps ought to have said before in the proper place. The part of the men has been played out, and now properly enough comes the turn of the women. Of them I will proceed to speak, and the more readily since I am invited by you.

For men born and educated like our citizens, the only way, in my opinion, of arriving at a right conclusion about the possession and use of women and children is to follow the path on which we originally started, when we said that the men were to be the guardians and watchdogs of the herd.

True.

Let us further suppose the birth and education of our women to be subject to similar or nearly similar regulations; then we shall see whether the result accords with our design.

What do you mean?

What I mean may be put into the form of a question, I said: Are dogs divided into he's and she's, or do they both share equally in hunting and in keeping watch and in the other duties of dogs? or do we intrust to the males the entire and exclusive care of the flocks, while we leave the females at home, under the idea that the bearing and the suckling of their puppies are labor enough for them?

No, he said, they share alike; the only difference between them is that the males are stronger and the females weaker.

But can you use different animals for the same purpose, unless they are bred and fed in the same way?

You cannot.

Then, if women are to have the same duties as men, they must have the same nurture and education?

Yes.

The education which was assigned to the men was music and gymnastics. Yes.

Then women must be taught music and gymnastics and also the art of war, which they must practise like the men?

That is the inference, I suppose.

I should rather expect, I said, that several of our proposals, if they are carried out, being unusual, may appear ridiculous.

No doubt of it.

Yes, and the most ridiculous thing of all will be the sight of women naked in the palaestra, exercising with the men, especially when they are no longer young; they certainly will not be a vision of beauty, any more than the enthusiastic old men who, in spite of wrinkles and ugliness, continue to frequent the gymnasia.

Yes, indeed, he said: according to present notions the proposal would be thought ridiculous.

But then, I said, as we have determined to speak our minds, we must not fear the jests of the wits which will be directed against this sort of innovation; how they will talk of women's attainments, both in music and gymnastics, and above all about their wearing armor and riding upon horseback!

Very true, he replied. Yet, having begun, we must go forward to the rough places of the law; at the same time begging of these gentlemen for once in their life to be serious. Not long ago, as we shall remind them, the Hellenes were of the opinion, which is still generally received among the barbarians, that the sight of a naked man was ridiculous and improper; and when first the Cretans, and then the Lacedaemonians, introduced the custom, the wits of that day might equally have ridiculed the innovation.

No doubt.

But when experience showed that to let all things be uncovered was far better than to cover them up, and the ludicrous effect to the outward eye had vanished before the better principle which reason asserted, then the man was perceived to be a fool who directs the shafts of his ridicule at any other sight but that of folly and vice, or seriously inclines to weigh the beautiful by any other standard but that of the good.

Very true, he replied.

First, then, whether the question is to be put in jest or in earnest, let us come to an understanding about the nature of woman: Is she capable of sharing either wholly or partially in the actions of men, or not at all? And is the art of war one of those arts in which she can or cannot share? That will be the best way of commencing the inquiry, and will probably lead to the fairest conclusion.

That will be much the best way.

Shall we take the other side first and begin by arguing against ourselves? in this manner the adversary's position will not be undefended.

Why not? he said.

Then let us put a speech into the mouths of our opponents. They will say: "Socrates and Glaucon, no adversary need convict you, for you yourselves, at the first foundation of the State, admitted the principle that everybody was to do the one work suited to his own nature." And certainly, if I am not mistaken, such an admission was made by us. "And do not the natures of men and women differ very much indeed?" And we shall reply, Of course they do. Then we shall be asked, "Whether the tasks assigned to men and to women should not be different, and such as are agreeable to their different natures?" Certainly they should. "But if so, have you not fallen into a serious inconsistency in saying that men and women, whose natures are so entirely different, ought to perform the same actions?" What defence will you make for us, my good sir, against anyone who offers these objections?

That is not an easy question to answer when asked suddenly; and I shall and I do beg of you to draw out the case on our side.

These are the objections, Glaucon, and there are many others of a like kind, which I foresaw long ago; they made me afraid and reluctant to take in hand any law about the possession and nurture of women and children.

By Zeus, he said, the problem to be solved is anything but easy. Why, yes, I said, but the fact is that when a man is out of his depth, whether he has fallen into a little swimmingbath or into midocean, he has to swim all the same.

Very true.

And must not we swim and try to reach the shore -- we will hope that Arion's dolphin or some other miraculous help may save us?

I suppose so, he said. Well, then, let us see if any way of escape can be found. We acknowledged -- did we not? -- that different natures ought to have different pursuits, and that men's and women's natures are different. And now what are we saying? -- that different natures ought to have the same pursuits -- this is the inconsistency which is charged upon us.

Precisely.

Verily, Glaucon, I said, glorious is the power of the art of contradiction!

Why do you say so?

Because I think that many a man falls into the practice against his will. When he thinks that he is reasoning he is

really disputing, just because he cannot define and divide, and so know that of which he is speaking; and he will pursue a merely verbal opposition in the spirit of contention and not of fair discussion.

Yes, he replied, such is very often the case; but what has that to do with us and our argument?

A great deal; for there is certainly a danger of our getting unintentionally into a verbal opposition.

In what way? Why we valiantly and pugnaciously insist upon the verbal truth, that different natures ought to have different pursuits, but we never considered at all what was the meaning of sameness or difference of nature, or why we distinguished them when we assigned different pursuits to different natures and the same to the same natures.

Why, no, he said, that was never considered by us.

I said: Suppose that by way of illustration we were to ask the question whether there is not an opposition in nature between bald men and hairy men; and if this is admitted by us, then, if bald men are cobblers, we should forbid the hairy men to be cobblers, and conversely?

That would be a jest, he said.

Yes, I said, a jest; and why? because we never meant when we constructed the State, that the opposition of natures should extend to every difference, but only to those differences which affected the pursuit in which the individual is engaged; we should have argued, for example, that a physician and one who is in mind a physician may be said to have the same nature.

True.

Whereas the physician and the carpenter have different natures?

Certainly.

And if, I said, the male and female sex appear to differ in their fitness for any art or pursuit, we should say that such pursuit or art ought to be assigned to one or the other of them; but if the difference consists only in women bearing and men begetting children, this does not amount to a proof that a woman differs from a man in respect of the sort of education she should receive; and we shall therefore continue to maintain that our guardians and their wives ought to have the same pursuits.

Very true, he said.

Next, we shall ask our opponent how, in reference to any of the pursuits or arts of civic life, the nature of a woman differs from that of a man?

That will be quite fair.

And perhaps he, like yourself, will reply that to give a sufficient answer on the instant is not easy; but after a little reflection there is no difficulty.

Yes, perhaps.

Suppose then that we invite him to accompany us in the argument, and then we may hope to show him that there is nothing peculiar in the constitution of women which would affect them in the administration of the State.

By all means.

Let us say to him: Come now, and we will ask you a question: When you spoke of a nature gifted or not gifted in any respect, did you mean to say that one man will acquire a thing easily, another with difficulty; a little learning will lead the one to discover a great deal, whereas the other, after much study and application, no sooner learns than he forgets; or again, did you mean, that the one has a body which is a good servant to his mind, while the body of the other is a hinderance to him? -- would not these be the sort of differences which distinguish the man gifted by nature from the one who is ungifted?

No one will deny that.

And can you mention any pursuit of mankind in which the male sex has not all these gifts and qualities in a higher degree than the female? Need I waste time in speaking of the art of weaving, and the management of pancakes and preserves, in which womankind does really appear to be great, and in which for her to be beaten by a man is of all things the most absurd?

You are quite right, he replied, in maintaining the general inferiority of the female sex: although many women are in many things superior to many men, yet on the whole what you say is true.

And if so, my friend, I said, there is no special faculty of administration in a State which a woman has because she is a woman, or which a man has by virtue of his sex, but the gifts of nature are alike diffused in both; all the pursuits of men are the pursuits of women also, but in all of them a woman is inferior to a man.

Very true.

Then are we to impose all our enactments on men and none of them on women?

That will never do.

One woman has a gift of healing, another not; one is a musician, and another has no music in her nature?

Very true.

And one woman has a turn for gymnastic and military exercises, and another is unwarlike and hates gymnastics?

Certainly.

And one woman is a philosopher, and another is an enemy of philosophy; one has spirit, and another is without spirit?

That is also true.

Then one woman will have the temper of a guardian, and another not. Was not the selection of the male guardians determined by differences of this sort?

Yes.

Men and women alike possess the qualities which make a guardian; they differ only in their comparative strength or weakness.

Obviously.

And those women who have such qualities are to be selected as the companions and colleagues of men who have similar qualities and whom they resemble in capacity and in character?

Very true.

And ought not the same natures to have the same pursuits?

They ought.

Then, as we were saying before, there is nothing unnatural in assigning music and gymnastics to the wives of the guardians -- to that point we come round again.

Certainly not.

The law which we then enacted was agreeable to nature, and therefore not an impossibility or mere aspiration; and the contrary practice, which prevails at present, is in reality a violation of nature.

That appears to be true.

We had to consider, first, whether our proposals were possible, and secondly whether they were the most beneficial?

Yes.

And the possibility has been acknowledged?

Yes.

The very great benefit has next to be established?

Quite so.

You will admit that the same education which makes a

man a good guardian will make a woman a good guardian; for their original nature is the same?

Yes.

I should like to ask you a question.

What is it?

Would you say that all men are equal in excellence, or is one man better than another?

The latter.

And in the commonwealth which we were founding do you conceive the guardians who have been brought up on our model system to be more perfect men, or the cobblers whose education has been cobbling?

What a ridiculous question!

You have answered me, I replied: Well, and may we not further say that our guardians are the best of our citizens?

By far the best.

And will not their wives be the best women?

Yes, by far the best.

And can there be anything better for the interests of the State than that the men and women of a State should be as good as possible?

There can be nothing better.

And this is what the arts of music and gymnastics, when present in such a manner as we have described, will accomplish?

Certainly.

Then we have made an enactment not only possible but in the highest degree beneficial to the State?

True.

Then let the wives of our guardians strip, for their virtue will be their robe, and let them share in the toils of war and the defence of their country; only in the distribution of labors the lighter are to be assigned to the women, who are the weaker natures, but in other respects their duties are to be the same. And as for the man who laughs at naked women exercising their bodies from the best of motives, in his laughter he is plucking

"A fruit of unripe wisdom,"

and he himself is ignorant of what he is laughing at, or what he is about; for that is, and ever will be, the best of sayings, "that the useful is the noble, and the hurtful

is the base."

Very true.

Here, then, is one difficulty in our law about women, which we may say that we have now escaped; the wave has not swallowed us up alive for enacting that the guardians of either sex should have all their pursuits in common; to the utility and also to the possibility of this arrangement the consistency of the argument with itself bears witness.

Yes, that was a mighty wave which you have escaped.

Yes, I said, but a greater is coming; you will not think much of this when you see the next.

Go on; let me see.

The law, I said, which is the sequel of this and of all that has preceded, is to the following effect, "that the wives of our guardians are to be common, and their children are to be common, and no parent is to know his own child, nor any child his parent."

Yes, he said, that is a much greater wave than the other; and the possibility as well as the utility of such a law are far more questionable.

I do not think, I said, that there can be any dispute about the very great utility of having wives and children in common; the possibility is quite another matter, and will be very much disputed.

I think that a good many doubts may be raised about both.

You imply that the two questions must be combined, I replied. Now I meant that you should admit the utility; and in this way, as I thought, I should escape from one of them, and then there would remain only the possibility.

But that little attempt is detected, and therefore you will please to give a defence of both.

Well, I said, I submit to my fate. Yet grant me a little favor: let me feast my mind with the dream as daydreamers are in the habit of feasting themselves when they are walking alone; for before they have discovered any means of effecting their wishes -- that is a matter which never troubles them -- they would rather not tire themselves by thinking about possibilities; but assuming that what they desire is already granted to them, they proceed with their plan, and delight in detailing what they mean to do when their wish has come true -- that is a way which they have of not doing much good to a capacity which was never good for much. Now I myself am beginning to lose heart, and I should like, with your permission, to pass over the question of possibility at present. Assuming therefore the possibility of the proposal, I shall now proceed to inquire how the rulers will carry out these arrangements, and I shall demonstrate that our plan, if executed, will be of the

greatest benefit to the State and to the guardians. First of all, then, if you have no objection, I will endeavor with your help to consider the advantages of the measure; and hereafter the question of possibility.

I have no objection; proceed.

First, I think that if our rulers and their auxiliaries are to be worthy of the name which they bear, there must be willingness to obey in the one and the power of command in the other; the guardians themselves must obey the laws, and they must also imitate the spirit of them in any details which are intrusted to their care.

That is right, he said.

You, I said, who are their legislator, having selected the men, will now select the women and give them to them; they must be as far as possible of like natures with them; and they must live in common houses and meet at common meals. None of them will have anything specially his or her own; they will be together, and will be brought up together, and will associate at gymnastic exercises. And so they will be drawn by a necessity of their natures to have intercourse with each other -- necessity is not too strong a word, I think?

Yes, he said; necessity, not geometrical, but another sort of necessity which lovers know, and which is far more convincing and constraining to the mass of mankind.

True, I said; and this, Glaucon, like all the rest, must proceed after an orderly fashion; in a city of the blessed, licentiousness is an unholy thing which the rulers will forbid.

Yes, he said, and it ought not to be permitted.

Then clearly the next thing will be to make matrimony sacred in the highest degree, and what is most beneficial will be deemed sacred?

Exactly.

And how can marriages be made most beneficial? that is a question which I put to you, because I see in your house dogs for hunting, and of the nobler sort of birds not a few. Now, I beseech you, do tell me, have you ever attended to their pairing and breeding?

In what particulars?

Why, in the first place, although they are all of a good sort, are not some better than others?

True.

And do you breed from them all indifferently, or do you take care to breed from the best only?

From the best.

And do you take the oldest or the youngest, or only those of ripe age?

I choose only those of ripe age.

And if care was not taken in the breeding, your dogs and birds would greatly deteriorate?

Certainly.

And the same of horses and of animals in general?

Undoubtedly.

Good heavens! my dear friend, I said, what consummate skill will our rulers need if the same principle holds of the human species!

Certainly, the same principle holds; but why does this involve any particular skill?

Because, I said, our rulers will often have to practise upon the body corporate with medicines. Now you know that when patients do not require medicines, but have only to be put under a regimen, the inferior sort of practitioner is deemed to be good enough; but when medicine has to be given, then the doctor should be more of a man.

That is quite true, he said; but to what are you alluding?

I mean, I replied, that our rulers will find a considerable dose of falsehood and deceit necessary for the good of their subjects: we were saying that the use of all these things regarded as medicines might be of advantage.

And we were very right.

And this lawful use of them seems likely to be often needed in the regulations of marriages and births.

How so?

Why, I said, the principle has been already laid down that the best of either sex should be united with the best as often, and the inferior with the inferior as seldom, as possible; and that they should rear the offspring of the one sort of union, but not of the other, if the flock is to be maintained in firstrate condition. Now these goings on must be a secret which the rulers only know, or there will be a further danger of our herd, as the guardians may be termed, breaking out into rebellion.

Very true.

Had we better not appoint certain festivals at which we will bring together the brides and bridegrooms, and sacrifices will be offered and suitable hymeneal songs composed by our poets: the number of weddings is a matter which must be left to the discretion of the rulers, whose

aim will be to preserve the average of population? There are many other things which they will have to consider, such as the effects of wars and diseases and any similar agencies, in order as far as this is possible to prevent the State from becoming either too large or too small.

Certainly, he replied.

We shall have to invent some ingenious kind of lots which the less worthy may draw on each occasion of our bringing them together, and then they will accuse their own illluck and not the rulers.

To be sure, he said.

And I think that our braver and better youth, besides their other honors and rewards, might have greater facilities of intercourse with women given them; their bravery will be a reason, and such fathers ought to have as many sons as possible.

True.

And the proper officers, whether male or female or both, for offices are to be held by women as well as by men -- Yes --

The proper officers will take the offspring of the good parents to the pen or fold, and there they will deposit them with certain nurses who dwell in a separate quarter; but the offspring of the inferior, or of the better when they chance to be deformed, will be put away in some mysterious, unknown place, as they should be.

Yes, he said, that must be done if the breed of the guardians is to be kept pure.

They will provide for their nurture, and will bring the mothers to the fold when they are full of milk, taking the greatest possible care that no mother recognizes her own child; and other wetnurses may be engaged if more are required. Care will also be taken that the process of suckling shall not be protracted too long; and the mothers will have no getting up at night or other trouble, but will hand over all this sort of thing to the nurses and attendants.

You suppose the wives of our guardians to have a fine easy time of it when they are having children.

Why, said I, and so they ought. Let us, however, proceed with our scheme. We were saying that the parents should be in the prime of life?

Very true.

And what is the prime of life? May it not be defined as a period of about twenty years in a woman's life, and thirty years in a man's?

Which years do you mean to include?

A woman, I said, at twenty years of age may begin to bear children to the State, and continue to bear them until forty; a man may begin at fiveandtwenty, when he has passed the point at which the pulse of life beats quickest, and continue to beget children until he be fiftyfive.

Certainly, he said, both in men and women those years are the prime of physical as well as of intellectual vigor. Anyone above or below the prescribed ages who takes part in the public hymeneals shall be said to have done an unholy and unrighteous thing; the child of which he is the father, if it steals into life, will have been conceived under auspices very unlike the sacrifices and prayers, which at each hymeneal priestesses and priests and the whole city will offer, that the new generation may be better and more useful than their good and useful parents, whereas his child will be the offspring of darkness and strange lust.

Very true, he replied.

And the same law will apply to any one of those within the prescribed age who forms a connection with any woman in the prime of life without the sanction of the rulers; for we shall say that he is raising up a bastard to the State, uncertified and unconsecrated.

Very true, he replied.

This applies, however, only to those who are within the specified age: after that we will allow them to range at will, except that a man may not marry his daughter or his daughter's daughter, or his mother or his mother's mother; and women, on the other hand, are prohibited from marrying their sons or fathers, or son's son or father's father, and so on in either direction. And we grant all this, accompanying the permission with strict orders to prevent any embryo which may come into being from seeing the light; and if any force a way to the birth, the parents must understand that the offspring of such a union cannot be maintained, and arrange accordingly.

That also, he said, is a reasonable proposition. But how will they know who are fathers and daughters, and so on?

They will never know. The way will be this: dating from the day of the hymeneal, the bridegroom who was then married will call all the male children who are born in the seventh and the tenth month afterward his sons, and the female children his daughters, and they will call him father, and he will call their children his grandchildren, and they will call the elder generation grandfathers and grandmothers. All who were begotten at the time when their fathers and mothers came together will be called their brothers and sisters, and these, as I was saying, will be forbidden to intermarry. This, however, is not to be understood as an absolute prohibition of the marriage of brothers and sisters; if the lot favors them, and they receive the sanction of the Pythian oracle, the law will allow them.

Quite right, he replied.

Such is the scheme, Glaucon, according to which the guardians of our State are to have their wives and families in common. And now you would have the argument show that this community is consistent with the rest of our polity, and also that nothing can be better -- would you not?

Yes, certainly.

Shall we try to find a common basis by asking of ourselves what ought to be the chief aim of the legislator in making laws and in the organization of a State -- what is the greatest good, and what is the greatest evil, and then consider whether our previous description has the stamp of the good or of the evil?

By all means.

Can there be any greater evil than discord and distraction and plurality where unity ought to reign? or any greater good than the bond of unity?

There cannot.

And there is unity where there is community of pleasures and pains -- where all the citizens are glad or grieved on the same occasions of joy and sorrow?

No doubt.

Yes; and where there is no common but only private feeling a State is disorganized -- when you have onehalf of the world triumphing and the other plunged in grief at the same events happening to the city or the citizens?

Certainly.

Such differences commonly originate in a disagreement about the use of the terms "mine" and "not mine," "his" and "not his."

Exactly so.

And is not that the bestordered State in which the greatest number of persons apply the terms "mine" and "not mine" in the same way to the same thing?

Quite true.

Or that again which most nearly approaches to the condition of the individual -- as in the body, when but a finger of one of us is hurt, the whole frame, drawn toward the soul as a centre and forming one kingdom under the ruling power therein, feels the hurt and sympathizes all together with the part affected, and we say that the man has a pain in his finger; and the same expression is used about any other part of the body, which has a sensation of pain at suffering or of pleasure at the alleviation of suffering.

Very true, he replied; and I agree with you that in the bestordered State there is the nearest approach to this

common feeling which you describe.

Then when any one of the citizens experiences any good or evil, the whole State will make his case their own, and will either rejoice or sorrow with him?

Yes, he said, that is what will happen in a wellordered State.

It will now be time, I said, for us to return to our State and see whether this or some other form is most in accordance with these fundamental principles.

Very good.

Our State, like every other, has rulers and subjects?

True.

All of whom will call one another citizens?

Of course.

But is there not another name which people give to their rulers in other States?

Generally they call them masters, but in democratic States they simply call them rulers.

And in our State what other name besides that of citizens do the people give the rulers?

They are called saviours and helpers, he replied.

And what do the rulers call the people?

Their maintainers and fosterfathers.

And what do they call them in other States?

Slaves.

And what do the rulers call one another in other States?

Fellowrulers.

And what in ours?

Fellowguardians.

Did you ever know an example in any other State of a ruler who would speak of one of his colleagues as his friend and of another as not being his friend?

Yes, very often.

And the friend he regards and describes as one in whom he has an interest, and the other as a stranger in whom he has no interest?

Exactly.

But would any of your guardians think or speak of any other guardian as a stranger?

Certainly he would not; for everyone whom they meet will be regarded by them either as a brother or sister, or father or mother, or son or daughter, or as the child or parent of those who are thus connected with him.

Capital, I said; but let me ask you once more: Shall they be a family in name only; or shall they in all their actions be true to the name? For example, in the use of the word "father," would the care of a father be implied and the filial reverence and duty and obedience to him which the law commands; and is the violator of these duties to be regarded as an impious and unrighteous person who is not likely to receive much good either at the hands of God or of man? Are these to be or not to be the strains which the children will hear repeated in their ears by all the citizens about those who are intimated to them to be their parents and the rest of their kinsfolk?

These, he said, and none other; for what can be more ridiculous than for them to utter the names of family ties with the lips only and not to act in the spirit of them?

Then in our city the language of harmony and concord will be more often heard than in any other. As I was describing before, when anyone is well or ill, the universal word will be "with me it is well" or "it is ill."

Most true.

And agreeably to this mode of thinking and speaking, were we not saying that they will have their pleasures and pains in common?

Yes, and so they will.

And they will have a common interest in the same thing which they will alike call "my own," and having this common interest they will have a common feeling of pleasure and pain?

Yes, far more so than in other States.

And the reason of this, over and above the general constitution of the State, will be that the guardians will have a community of women and children?

That will be the chief reason.

And this unity of feeling we admitted to be the greatest good, as was implied in our comparison of a wellordered State to the relation of the body and the members, when affected by pleasure or pain?

That we acknowledged, and very rightly.

Then the community of wives and children among our

citizens is clearly the source of the greatest good to the State?

Certainly.

And this agrees with the other principle which we were affirming -- that the guardians were not to have houses or lands or any other property; their pay was to be their food, which they were to receive from the other citizens, and they were to have no private expenses; for we intended them to preserve their true character of guardians.

Right, he replied.

Both the community of property and the community of families, as I am saying, tend to make them more truly guardians; they will not tear the city in pieces by differing about "mine" and "not mine;" each man dragging any acquisition which he has made into a separate house of his own, where he has a separate wife and children and private pleasures and pains; but all will be affected as far as may be by the same pleasures and pains because they are all of one opinion about what is near and dear to them, and therefore they all tend toward a common end.

Certainly, he replied.

And as they have nothing but their persons which they can call their own, suits and complaints will have no existence among them; they will be delivered from all those quarrels of which money or children or relations are the occasion.

Of course they will.

Neither will trials for assault or insult ever be likely to occur among them. For that equals should defend themselves against equals we shall maintain to be honorable and right; we shall make the protection of the person a matter of necessity.

That is good, he said.

Yes; and there is a further good in the law; viz., that if a man has a quarrel with another he will satisfy his resentment then and there, and not proceed to more dangerous lengths.

Certainly.

To the elder shall be assigned the duty of ruling and chastising the younger.

Clearly.

Nor can there be a doubt that the younger will not strike or do any other violence to an elder, unless the magistrates command him; nor will he slight him in any way. For there are two guardians, shame and fear, mighty to prevent him: shame, which makes men refrain from laying hands on those who are to them in the relation of parents;

fear, that the injured one will be succored by the others who are his brothers, sons, fathers.

That is true, he replied.

Then in every way the laws will help the citizens to keep the peace with one another?

Yes, there will be no want of peace.

And as the guardians will never quarrel among themselves there will be no danger of the rest of the city being divided either against them or against one another.

None whatever.

I hardly like even to mention the little meannesses of which they will be rid, for they are beneath notice: such, for example, as the flattery of the rich by the poor, and all the pains and pangs which men experience in bringing up a family, and in finding money to buy necessaries for their household, borrowing and then repudiating, getting how they can, and giving the money into the hands of women and slaves to keep -- the many evils of so many kinds which people suffer in this way are mean enough and obvious enough, and not worth speaking of.

Yes, he said, a man has no need of eyes in order to perceive that.

And from all these evils they will be delivered, and their life will be blessed as the life of Olympic victors and yet more blessed.

How so?

The Olympic victor, I said, is deemed happy in receiving a part only of the blessedness which is secured to our citizens, who have won a more glorious victory and have a more complete maintenance at the public cost. For the victory which they have won is the salvation of the whole State; and the crown with which they and their children are crowned is the fulness of all that life needs; they receive rewards from the hands of their country while living, and after death have an honorable burial.

Do you remember, I said, how in the course of the previous discussion someone who shall be nameless accused us of making our guardians unhappy -- they had nothing and might have possessed all things -- to whom we replied that, if an occasion offered, we might perhaps hereafter consider this question, but that, as at present divided, we would make our guardians truly guardians, and that we were fashioning the State with a view to the greatest happiness, not of any particular class, but of the whole?

Yes, I remember.

And what do you say, now that the life of our protectors is made out to be far better and nobler than that of Olympic victors -- is the life of shoemakers, or any

other artisans, or of husbandmen, to be compared with it?

Certainly not.

At the same time I ought here to repeat what I have said elsewhere, that if any of our guardians shall try to be happy in such a manner that he will cease to be a guardian, and is not content with this safe and harmonious life, which, in our judgment, is of all lives the best, but, infatuated by some youthful conceit of happiness which gets up into his head shall seek to appropriate the whole State to himself, then he will have to learn how wisely Hesiod spoke, when he said, "half is more than the whole."

If he were to consult me, I should say to him: Stay where you are, when you have the offer of such a life.

You agree then, I said, that men and women are to have a common way of life such as we have described -- common education, common children; and they are to watch over the citizens in common whether abiding in the city or going out to war; they are to keep watch together, and to hunt together like dogs; and always and in all things, as far as they are able, women are to share with the men? And in so doing they will do what is best, and will not violate, but preserve, the natural relation of the sexes.

I agree with you, he replied.

The inquiry, I said, has yet to be made, whether such a community will be found possible -- as among other animals, so also among men -- and if possible, in what way possible?

You have anticipated the question which I was about to suggest.

There is no difficulty, I said, in seeing how war will be carried on by them.

How?

Why, of course they will go on expeditions together; and will take with them any of their children who are strong enough, that, after the manner of the artisan's child, they may look on at the work which they will have to do when they are grown up; and besides looking on they will have to help and be of use in war, and to wait upon their fathers and mothers. Did you never observe in the arts how the potters' boys look on and help, long before they touch the wheel?

Yes, I have.

And shall potters be more careful in educating their children and in giving them the opportunity of seeing and practising their duties than our guardians will be?

The idea is ridiculous, he said.

There is also the effect on the parents, with whom, as with other animals, the presence of their young ones will be the greatest incentive to valor.

That is quite true, Socrates; and yet if they are defeated, which may often happen in war, how great the danger is! the children will be lost as well as their parents, and the State will never recover.

True, I said; but would you never allow them to run any risk?

I am far from saying that.

Well, but if they are ever to run a risk should they not do so on some occasion when, if they escape disaster, they will be the better for it?

Clearly.

Whether the future soldiers do or do not see war in the days of their youth is a very important matter, for the sake of which some risk may fairly be incurred.

Yes, very important.

This then must be our first step -- to make our children spectators of war; but we must also contrive that they shall be secured against danger; then all will be well.

True.

Their parents may be supposed not to be blind to the risks of war, but to know, as far as human foresight can, what expeditions are safe and what dangerous?

That may be assumed.

And they will take them on the safe expeditions and be cautious about the dangerous ones?

True.

And they will place them under the command of experienced veterans who will be their leaders and teachers?

Very properly.

Still, the dangers of war cannot be always foreseen; there is a good deal of chance about them?

True.

Then against such chances the children must be at once furnished with wings, in order that in the hour of need they may fly away and escape.

What do you mean? he said.

I mean that we must mount them on horses in their earliest youth, and when they have learnt to ride, take them on horseback to see war: the horses must not be spirited and warlike, but the most tractable and yet the swiftest that can be had. In this way they will get an excellent view of

what is hereafter to be their own business; and if there is danger they have only to follow their elder leaders and escape.

I believe that you are right, he said.

Next, as to war; what are to be the relations of your soldiers to one another and to their enemies? I should be inclined to propose that the soldier who leaves his rank or throws away his arms, or is guilty of any other act of cowardice, should be degraded into the rank of a husbandman or artisan. What do you think?

By all means, I should say.

And he who allows himself to be taken prisoner may as well be made a present of to his enemies; he is their lawful prey, and let them do what they like with him.

Certainly.

But the hero who has distinguished himself, what shall be done to him? In the first place, he shall receive honor in the army from his youthful comrades; every one of them in succession shall crown him. What do you say?

I approve.

And what do you say to his receiving the right hand of fellowship?

To that too, I agree.

But you will hardly agree to my next proposal.

What is your proposal?

That he should kiss and be kissed by them.

Most certainly, and I should be disposed to go further, and say: Let no one whom he has a mind to kiss refuse to be kissed by him while the expedition lasts. So that if there be a lover in the army, whether his love be youth or maiden, he may be more eager to win the prize of valor.

Capital, I said. That the brave man is to have more wives than others has been already determined: and he is to have first choices in such matters more than others, in order that he may have as many children as possible?

Agreed.

Again, there is another manner in which, according to Homer, brave youths should be honored; for he tells how Ajax, after he had distinguished himself in battle, was rewarded with long chines, which seems to be a compliment appropriate to a hero in the flower of his age, being not only a tribute of honor but also a very strengthening thing.

Most true, he said.

Then in this, I said, Homer shall be our teacher; and we too, at sacrifices and on the like occasions, will honor the brave according to the measure of their valor, whether men or women, with hymns and those other distinctions which we were mentioning; also with

"seats of precedence, and meats and full cups;"

and in honoring them, we shall be at the same time training them.

That, he replied, is excellent.

Yes, I said; and when a man dies gloriously in war shall we not say, in the first place, that he is of the golden race?

To be sure.

Nay, have we not the authority of Hesiod for affirming that when they are dead

"They are holy angels upon the earth, authors of good, averters of evil, the guardians of speechgifted men"?

Yes; and we accept his authority.

We must learn of the god how we are to order the sepulture of divine and heroic personages, and what is to be their special distinction; and we must do as he bids?

By all means.

And in ages to come we will reverence them and kneel before their sepulchres as at the graves of heroes. And not only they but any who are deemed preeminently good, whether they die from age or in any other way, shall be admitted to the same honors.

That is very right, he said.

Next, how shall our soldiers treat their enemies? What about this?

In what respect do you mean?

First of all, in regard to slavery? Do you think it right that Hellenes should enslave Hellenic States, or allow others to enslave them, if they can help? Should not their custom be to spare them, considering the danger which there is that the whole race may one day fall under the yoke of the barbarians?

To spare them is infinitely better.

Then no Hellene should be owned by them as a slave; that is a rule which they will observe and advise the other Hellenes to observe.

Certainly, he said; they will in this way be united against the barbarians and will keep their hands off one

another.

Next as to the slain; ought the conquerors, I said, to take anything but their armor? Does not the practice of despoiling an enemy afford an excuse for not facing the battle? Cowards skulk about the dead, pretending that they are fulfilling a duty, and many an army before now has been lost from this love of plunder.

Very true.

And is there not illiberality and avarice in robbing a corpse, and also a degree of meanness and womanishness in making an enemy of the dead body when the real enemy has flown away and left only his fighting gear behind him -- is not this rather like a dog who cannot get at his assailant, quarrelling with the stones which strike him instead?

Very like a dog, he said.

Then we must abstain from spoiling the dead or hindering their burial?

Yes, he replied, we most certainly must.

Neither shall we offer up arms at the temples of the gods, least of all the arms of Hellenes, if we care to maintain good feeling with other Hellenes; and, indeed, we have reason to fear that the offering of spoils taken from kinsmen may be a pollution unless commanded by the god himself?

Very true.

Again, as to the devastation of Hellenic territory or the burning of houses, what is to be the practice?

May I have the pleasure, he said, of hearing your opinion?

Both should be forbidden, in my judgment; I would take the annual produce and no more. Shall I tell you why?

Pray do.

Why, you see, there is a difference in the names "discord" and "war," and I imagine that there is also a difference in their natures; the one is expressive of what is internal and domestic, the other of what is external and foreign; and the first of the two is termed discord, and only the second, war.

That is a very proper distinction, he replied.

And may I not observe with equal propriety that the Hellenic race is all united together by ties of blood and friendship, and alien and strange to the barbarians?

Very good, he said.

And therefore when Hellenes fight with barbarians, and

barbarians with Hellenes, they will be described by us as being at war when they fight, and by nature enemies, and this kind of antagonism should be called war; but when Hellenes fight with one another we shall say that Hellas is then in a state of disorder and discord, they being by nature friends; and such enmity is to be called discord.

I agree.

Consider then, I said, when that which we have acknowledged to be discord occurs, and a city is divided, if both parties destroy the lands and burn the houses of one another, how wicked does the strife appear! No true lover of his country would bring himself to tear in pieces his own nurse and mother: There might be reason in the conqueror depriving the conquered of their harvest, but still they would have the idea of peace in their hearts, and would not mean to go on fighting forever.

Yes, he said, that is a better temper than the other.

And will not the city, which you are founding, be an Hellenic city?

It ought to be, he replied.

Then will not the citizens be good and civilized?

Yes, very civilized.

And will they not be lovers of Hellas, and think of Hellas as their own land, and share in the common temples?

Most certainly.

And any difference which arises among them will be regarded by them as discord only -- a quarrel among friends, which is not to be called a war?

Certainly not.

Then they will quarrel as those who intend some day to be reconciled? Certainly.

They will use friendly correction, but will not enslave or destroy their opponents; they will be correctors, not enemies?

Just so.

And as they are Hellenes themselves they will not devastate Hellas, nor will they burn houses, nor ever suppose that the whole population of a city -- men, women, and children -- are equally their enemies, for they know that the guilt of war is always confined to a few persons and that the many are their friends. And for all these reasons they will be unwilling to waste their lands and raze their houses; their enmity to them will only last until the many innocent sufferers have compelled the guilty few to give satisfaction?

I agree, he said, that our citizens should thus deal with their Hellenic enemies; and with barbarians as the Hellenes now deal with one another.

Then let us enact this law also for our guardians: that they are neither to devastate the lands of Hellenes nor to burn their houses.

Agreed; and we may agree also in thinking that these, like all our previous enactments, are very good.

But still I must say, Socrates, that if you are allowed to go on in this way you will entirely forget the other question which at the commencement of this discussion you thrust aside: Is such an order of things possible, and how, if at all? For I am quite ready to acknowledge that the plan which you propose, if only feasible, would do all sorts of good to the State. I will add, what you have omitted, that your citizens will be the bravest of warriors, and will never leave their ranks, for they will all know one another, and each will call the other father, brother, son; and if you suppose the women to join their armies, whether in the same rank or in the rear, either as a terror to the enemy, or as auxiliaries in case of need, I know that they will then be absolutely invincible; and there are many domestic advantages which might also be mentioned and which I also fully acknowledge: but, as I admit all these advantages and as many more as you please, if only this State of yours were to come into existence, we need say no more about them; assuming then the existence of the State, let us now turn to the question of possibility and ways and means -- the rest may be left.

If I loiter for a moment, you instantly make a raid upon me, I said, and have no mercy; I have hardly escaped the first and second waves, and you seem not to be aware that you are now bringing upon me the third, which is the greatest and heaviest. When you have seen and heard the third wave, I think you will be more considerate and will acknowledge that some fear and hesitation were natural respecting a proposal so extraordinary as that which I have now to state and investigate.

The more appeals of this sort which you make, he said, the more determined are we that you shall tell us how such a State is possible: speak out and at once.

Let me begin by reminding you that we found our way hither in the search after justice and injustice.

True, he replied; but what of that?

I was only going to ask whether, if we have discovered them, we are to require that the just man should in nothing fail of absolute justice; or may we be satisfied with an approximation, and the attainment in him of a higher degree of justice than is to be found in other men?

The approximation will be enough.

We were inquiring into the nature of absolute justice

and into the character of the perfectly just, and into injustice and the perfectly unjust, that we might have an ideal. We were to look at these in order that we might judge of our own happiness and unhappiness according to the standard which they exhibited and the degree in which we resembled them, but not with any view of showing that they could exist in fact.

True, he said.

Would a painter be any the worse because, after having delineated with consummate art an ideal of a perfectly beautiful man, he was unable to show that any such man could ever have existed?

He would be none the worse.

Well, and were we not creating an ideal of a perfect State?

To be sure.

And is our theory a worse theory because we are unable to prove the possibility of a city being ordered in the manner described?

Surely not, he replied.

That is the truth, I said. But if, at your request, I am to try and show how and under what conditions the possibility is highest, I must ask you, having this in view, to repeat your former admissions.

What admissions?

I want to know whether ideals are ever fully realized in language? Does not the word express more than the fact, and must not the actual, whatever a man may think, always, in the nature of things, fall short of the truth? What do you say?

I agree.

Then you must not insist on my proving that the actual State will in every respect coincide with the ideal: if we are only able to discover how a city may be governed nearly as we proposed, you will admit that we have discovered the possibility which you demand; and will be contented. I am sure that I should be contented -- will not you?

Yes, I will.

Let me next endeavor to show what is that fault in States which is the cause of their present maladministration, and what is the least change which will enable a State to pass into the truer form; and let the change, if possible, be of one thing only, or, if not, of two; at any rate, let the changes be as few and slight as possible.

Certainly, he replied.

I think, I said, that there might be a reform of the State if only one change were made, which is not a slight or easy though still a possible one.

What is it? he said.

Now then, I said, I go to meet that which I liken to the greatest of the waves; yet shall the word be spoken, even though the wave break and drown me in laughter and dishonor; and do you mark my words.

Proceed.

I said: "Until philosophers are kings, or the kings and princes of this world have the spirit and power of philosophy, and political greatness and wisdom meet in one, and those commoner natures who pursue either to the exclusion of the other are compelled to stand aside, cities will never have rest from their evils -- no, nor the human race, as I believe -- and then only will this our State have a possibility of life and behold the light of day." Such was the thought, my dear Glaucon, which I would fain have uttered if it had not seemed too extravagant; for to be convinced that in no other State can there be happiness private or public is indeed a hard thing.

Socrates, what do you mean? I would have you consider that the word which you have uttered is one at which numerous persons, and very respectable persons too, in a figure pulling off their coats all in a moment, and seizing any weapon that comes to hand, will run at you might and main, before you know where you are, intending to do heaven knows what; and if you don't prepare an answer, and put yourself in motion, you will be "pared by their fine wits," and no mistake.

You got me into the scrape, I said.

And I was quite right; however, I will do all I can to get you out of it; but I can only give you goodwill and good advice, and, perhaps, I may be able to fit answers to your questions better than another -- that is all. And now, having such an auxiliary, you must do your best to show the unbelievers that you are right.

I ought to try, I said, since you offer me such invaluable assistance. And I think that, if there is to be a chance of our escaping, we must explain to them whom we mean when we say that philosophers are to rule in the State; then we shall be able to defend ourselves: There will be discovered to be some natures who ought to study philosophy and to be leaders in the State; and others who are not born to be philosophers, and are meant to be followers rather than leaders.

Then now for a definition, he said.

Follow me, I said, and I hope that I may in some way or other be able to give you a satisfactory explanation.

Proceed.

I dare say that you remember, and therefore I need not remind you, that a lover, if he is worthy of the name, ought to show his love, not to some one part of that which he loves, but to the whole.

I really do not understand, and therefore beg of you to assist my memory.

Another person, I said, might fairly reply as you do; but a man of pleasure like yourself ought to know that all who are in the flower of youth do somehow or other raise a pang or emotion in a lover's breast, and are thought by him to be worthy of his affectionate regards. Is not this a way which you have with the fair: one has a snub nose, and you praise his charming face; the hooknose of another has, you say, a royal look; while he who is neither snub nor hooked has the grace of regularity: the dark visage is manly, the fair are children of the gods; and as to the sweet "honeypale," as they are called, what is the very name but the invention of a lover who talks in diminutives, and is not averse to paleness if appearing on the cheek of youth? In a word, there is no excuse which you will not make, and nothing which you will not say, in order not to lose a single flower that blooms in the springtime of youth.

If you make me an authority in matters of love, for the sake of the argument, I assent.

And what do you say of lovers of wine? Do you not see them doing the same? They are glad of any pretext of drinking any wine.

Very good.

And the same is true of ambitious men; if they cannot command an army, they are willing to command a file; and if they cannot be honored by really great and important persons, they are glad to be honored by lesser and meaner people -- but honor of some kind they must have.

Exactly.

Once more let me ask: Does he who desires any class of goods, desire the whole class or a part only?

The whole.

And may we not say of the philosopher that he is a lover, not of a part of wisdom only, but of the whole?

Yes, of the whole.

And he who dislikes learning, especially in youth, when he has no power of judging what is good and what is not, such a one we maintain not to be a philosopher or a lover of knowledge, just as he who refuses his food is not hungry, and may be said to have a bad appetite and not a good one?

Very true, he said.

Whereas he who has a taste for every sort of knowledge and who is curious to learn and is never satisfied, may be justly termed a philosopher? Am I not right?

Glaucon said: If curiosity makes a philosopher, you will find many a strange being will have a title to the name. All the lovers of sights have a delight in learning, and must therefore be included. Musical amateurs, too, are a folk strangely out of place among philosophers, for they are the last persons in the world who would come to anything like a philosophical discussion, if they could help, while they run about at the Dionysiac festivals as if they had let out their ears to hear every chorus; whether the performance is in town or country -- that makes no difference -- they are there. Now are we to maintain that all these and any who have similar tastes, as well as the professors of quite minor arts, are philosophers?

Certainly not, I replied; they are only an imitation.

He said: Who then are the true philosophers?

Those, I said, who are lovers of the vision of truth.

That is also good, he said; but I should like to know what you mean?

To another, I replied, I might have a difficulty in explaining; but I am sure that you will admit a proposition which I am about to make.

What is the proposition?

That since beauty is the opposite of ugliness, they are two?

Certainly.

And inasmuch as they are two, each of them is one?

True again.

And of just and unjust, good and evil, and of every other class, the same remark holds: taken singly, each of them is one; but from the various combinations of them with actions and things and with one another, they are seen in all sorts of lights and appear many? Very true.

And this is the distinction which I draw between the sightloving, artloving, practical class and those of whom I am speaking, and who are alone worthy of the name of philosophers.

How do you distinguish them? he said.

The lovers of sounds and sights, I replied, are, as I conceive, fond of fine tones and colors and forms and all the artificial products that are made out of them, but their minds are incapable of seeing or loving absolute beauty.

True, he replied.

Few are they who are able to attain to the sight of this.

Very true.

And he who, having a sense of beautiful things has no sense of absolute beauty, or who, if another lead him to a knowledge of that beauty is unable to follow -- of such a one I ask, Is he awake or in a dream only? Reflect: is not the dreamer, sleeping or waking, one who likens dissimilar things, who puts the copy in the place of the real object?

I should certainly say that such a one was dreaming.

But take the case of the other, who recognizes the existence of absolute beauty and is able to distinguish the idea from the objects which participate in the idea, neither putting the objects in the place of the idea nor the idea in the place of the objects -- is he a dreamer, or is he awake?

He is wide awake.

And may we not say that the mind of the one who knows has knowledge, and that the mind of the other, who opines only, has opinion?

Certainly.

But suppose that the latter should quarrel with us and dispute our statement, can we administer any soothing cordial or advice to him, without revealing to him that there is sad disorder in his wits?

We must certainly offer him some good advice, he replied.

Come, then, and let us think of something to say to him. Shall we begin by assuring him that he is welcome to any knowledge which he may have, and that we are rejoiced at his having it? But we should like to ask him a question: Does he who has knowledge know something or nothing? (You must answer for him).

I answer that he knows something.

Something that is or is not?

Something that is; for how can that which is not ever be known?

And are we assured, after looking at the matter from many points of view, that absolute being is or may be absolutely known, but that the utterly nonexistent is utterly unknown?

Nothing can be more certain.

Good. But if there be anything which is of such a nature as to be and not to be, that will have a place

intermediate between pure being and the absolute negation of being?

Yes, between them.

And, as knowledge corresponded to being and ignorance of necessity to notbeing, for that intermediate between being and notbeing there has to be discovered a corresponding intermediate between ignorance and knowledge, if there be such?

Certainly.

Do we admit the existence of opinion?

Undoubtedly.

As being the same with knowledge, or another faculty?

Another faculty.

Then opinion and knowledge have to do with different kinds of matter corresponding to this difference of faculties?

Yes.

And knowledge is relative to being and knows being. But before I proceed further I will make a division.

What division?

I will begin by placing faculties in a class by themselves: they are powers in us, and in all other things, by which we do as we do. Sight and hearing, for example, I should call faculties. Have I clearly explained the class which I mean?

Yes, I quite understand.

Then let me tell you my view about them. I do not see them, and therefore the distinctions of figure, color, and the like, which enable me to discern the differences of some things, do not apply to them. In speaking of a faculty I think only of its sphere and its result; and that which has the same sphere and the same result I call the same faculty, but that which has another sphere and another result I call different. Would that be your way of speaking?

Yes.

And will you be so very good as to answer one more question? Would you say that knowledge is a faculty, or in what class would you place it?

Certainly knowledge is a faculty, and the mightiest of all faculties.

And is opinion also a faculty?

Certainly, he said; for opinion is that with which we

are able to form an opinion.

And yet you were acknowledging a little while ago that knowledge is not the same as opinion?

Why, yes, he said: how can any reasonable being ever identify that which is infallible with that which errs?

An excellent answer, proving, I said, that we are quite conscious of a distinction between them.

Yes.

Then knowledge and opinion having distinct powers have also distinct spheres or subjectmatters?

That is certain.

Being is the sphere or subjectmatter of knowledge, and knowledge is to know the nature of being?

Yes.

And opinion is to have an opinion?

Yes.

And do we know what we opine? or is the subjectmatter of opinion the same as the subjectmatter of knowledge?

Nay, he replied, that has been already disproven; if difference in faculty implies difference in the sphere or subjectmatter, and if, as we were saying, opinion and knowledge are distinct faculties, then the sphere of knowledge and of opinion cannot be the same.

Then if being is the subjectmatter of knowledge, something else must be the subjectmatter of opinion?

Yes, something else. Well, then, is notbeing the subjectmatter of opinion? or, rather, how can there be an opinion at all about notbeing? Reflect: when a man has an opinion, has he not an opinion about something? Can he have an opinion which is an opinion about nothing?

Impossible.

He who has an opinion has an opinion about some one thing?

Yes.

And notbeing is not one thing, but, properly speaking, nothing?

True.

Of notbeing, ignorance was assumed to be the necessary correlative; of being, knowledge?

True, he said.

Then opinion is not concerned either with being or with notbeing?

Not with either.

And can therefore neither be ignorance nor knowledge?

That seems to be true.

But is opinion to be sought without and beyond either of them, in a greater clearness than knowledge, or in a greater darkness than ignorance?

In neither.

Then I suppose that opinion appears to you to be darker than knowledge, but lighter than ignorance?

Both; and in no small degree.

And also to be within and between them?

Yes.

Then you would infer that opinion is intermediate?

No question.

But were we not saying before, that if anything appeared to be of a sort which is and is not at the same time, that sort of thing would appear also to lie in the interval between pure being and absolute notbeing; and that the corresponding faculty is neither knowledge nor ignorance, but will be found in the interval between them?

True.

And in that interval there has now been discovered something which we call opinion?

There has.

Then what remains to be discovered is the object which partakes equally of the nature of being and notbeing, and cannot rightly be termed either, pure and simple; this unknown term, when discovered, we may truly call the subject of opinion, and assign each to their proper faculty -- the extremes to the faculties of the extremes and the mean to the faculty of the mean.

True.

This being premised, I would ask the gentleman who is of opinion that there is no absolute or unchangeable idea of beauty -- in whose opinion the beautiful is the manifold -- he, I say, your lover of beautiful sights, who cannot bear to be told that the beautiful is one, and the just is one, or that anything is one -- to him I would appeal, saying, Will you be so very kind, sir, as to tell us whether, of all these beautiful things, there is one which will not be found

ugly; or of the just, which will not be found unjust; or of the holy, which will not also be unholy?

No, he replied; the beautiful will in some point of view be found ugly; and the same is true of the rest.

And may not the many which are doubles be also halves? -- doubles, that is, of one thing, and halves of another?

Quite true.

And things great and small, heavy and light, as they are termed, will not be denoted by these any more than by the opposite names?

True; both these and the opposite names will always attach to all of them.

And can any one of those many things which are called by particular names be said to be this rather than not to be this?

He replied: They are like the punning riddles which are asked at feasts or the children's puzzle about the eunuch aiming at the bat, with what he hit him, as they say in the puzzle, and upon what the bat was sitting. The individual objects of which I am speaking are also a riddle, and have a double sense: nor can you fix them in your mind, either as being or notbeing, or both, or neither.

Then what will you do with them? I said. Can they have a better place than between being and notbeing? For they are clearly not in greater darkness or negation than notbeing, or more full of light and existence than being.

That is quite true, he said.

Thus then we seem to have discovered that the many ideas which the multitude entertain about the beautiful and about all other things are tossing about in some region which is halfway between pure being and pure notbeing?

We have.

Yes; and we had before agreed that anything of this kind which we might find was to be described as matter of opinion, and not as matter of knowledge; being the intermediate flux which is caught and detained by the intermediate faculty.

Quite true.

Then those who see the many beautiful, and who yet neither see absolute beauty, nor can follow any guide who points the way thither; who see the many just, and not absolute justice, and the like -- such persons may be said to have opinion but not knowledge?

That is certain.

But those who see the absolute and eternal and

immutable may be said to know, and not to have opinion only?

Neither can that be denied.

The one love and embrace the subjects of knowledge, the other those of opinion? The latter are the same, as I dare say you will remember, who listened to sweet sounds and gazed upon fair colors, but would not tolerate the existence of absolute beauty.

Yes, I remember.

Shall we then be guilty of any impropriety in calling them lovers of opinion rather than lovers of wisdom, and will they be very angry with us for thus describing them?

I shall tell them not to be angry; no man should be angry at what is true.

But those who love the truth in each thing are to be called lovers of wisdom and not lovers of opinion.

Assuredly.

* * * *

Book VI: The Philosophy Of Government

(SOCRATES, GLAUCON.)

AND thus, Glaucon, after the argument has gone a weary way, the true and the false philosophers have at length appeared in view.

I do not think, he said, that the way could have been shortened.

I suppose not, I said; and yet I believe that we might have had a better view of both of them if the discussion could have been confined to this one subject and if there were not many other questions awaiting us, which he who desires to see in what respect the life of the just differs from that of the unjust must consider.

And what is the next question? he asked.

Surely, I said, the one which follows next in order. Inasmuch as philosophers only are able to grasp the eternal and unchangeable, and those who wander in the region of the many and variable are not philosophers, I must ask you which of the two classes should be the rulers of our State?

And how can we rightly answer that question?

Whichever of the two are best able to guard the laws and institutions of our State -- let them be our guardians.

Very good.

Neither, I said, can there be any question that the guardian who is to keep anything should have eyes rather

than no eyes?

There can be no question of that.

And are not those who are verily and indeed wanting in the knowledge of the true being of each thing, and who have in their souls no clear pattern, and are unable as with a painter's eye to look at the absolute truth and to that original to repair, and having perfect vision of the other world to order the laws about beauty, goodness, justice in this, if not already ordered, and to guard and preserve the order of them -- are not such persons, I ask, simply blind?

Truly, he replied, they are much in that condition.

And shall they be our guardians when there are others who, besides being their equals in experience and falling short of them in no particular of virtue, also know the very truth of each thing?

There can be no reason, he said, for rejecting those who have this greatest of all great qualities; they must always have the first place unless they fail in some other respect. Suppose, then, I said, that we determine how far they can unite this and the other excellences.

By all means.

In the first place, as we began by observing, the nature of the philosopher has to be ascertained. We must come to an understanding about him, and, when we have done so, then, if I am not mistaken, we shall also acknowledge that such a union of qualities is possible, and that those in whom they are united, and those only, should be rulers in the State.

What do you mean?

Let us suppose that philosophical minds always love knowledge of a sort which shows them the eternal nature not varying from generation and corruption.

Agreed.

And further, I said, let us agree that they are lovers of all true being; there is no part whether greater or less, or more or less honorable, which they are willing to renounce; as we said before of the lover and the man of ambition.

True.

And if they are to be what we were describing, is there not another quality which they should also possess?

What quality?

Truthfulness: they will never intentionally receive into their minds falsehood, which is their detestation, and they will love the truth.

Yes, that may be safely affirmed of them.

"May be." my friend, I replied, is not the word; say rather, "must be affirmed:" for he whose nature is amorous of anything cannot help loving all that belongs or is akin to the object of his affections.

Right, he said.

And is there anything more akin to wisdom than truth?

How can there be?

Can the same nature be a lover of wisdom and a lover of falsehood?

Never.

The true lover of learning then must from his earliest youth, as far as in him lies, desire all truth?

Assuredly.

But then again, as we know by experience, he whose desires are strong in one direction will have them weaker in others; they will be like a stream which has been drawn off into another channel.

True.

He whose desires are drawn toward knowledge in every form will be absorbed in the pleasures of the soul, and will hardly feel bodily pleasure -- I mean, if he be a true philosopher and not a sham one.

That is most certain.

Such a one is sure to be temperate and the reverse of covetous; for the motives which make another man desirous of having and spending, have no place in his character.

Very true.

Another criterion of the philosophical nature has also to be considered.

What is that?

There should be no secret corner of illiberality; nothing can be more antagonistic than meanness to a soul which is ever longing after the whole of things both divine and human.

Most true, he replied.

Then how can he who has magnificence of mind and is the spectator of all time and all existence, think much of human life?

He cannot.

Or can such a one account death fearful? No, indeed.

Then the cowardly and mean nature has no part in true philosophy?

Certainly not.

Or again: can he who is harmoniously constituted, who is not covetous or mean, or a boaster, or a coward -- can he, I say, ever be unjust or hard in his dealings?

Impossible.

Then you will soon observe whether a man is just and gentle, or rude and unsociable; these are the signs which distinguish even in youth the philosophical nature from the unphilosophical.

True.

There is another point which should be remarked.

What point?

Whether he has or has not a pleasure in learning; for no one will love that which gives him pain, and in which after much toil he makes little progress.

Certainly not.

And again, if he is forgetful and retains nothing of what he learns, will he not be an empty vessel?

That is certain. Laboring in vain, he must end in hating himself and his fruitless occupation? Yes.

Then a soul which forgets cannot be ranked among genuine philosophic natures; we must insist that the philosopher should have a good memory?

Certainly.

And once more, the inharmonious and unseemly nature can only tend to disproportion?

Undoubtedly.

And do you consider truth to be akin to proportion or to disproportion?

To proportion.

Then, besides other qualities, we must try to find a naturally wellproportioned and gracious mind, which will move spontaneously toward the true being of everything.

Certainly.

Well, and do not all these qualities, which we have been enumerating, go together, and are they not, in a manner, necessary to a soul, which is to have a full and

perfect participation of being?

They are absolutely necessary, he replied.

And must not that be a blameless study which he only can pursue who has the gift of a good memory, and is quick to learn -- noble, gracious, the friend of truth, justice, courage, temperance, who are his kindred?

The god of jealousy himself, he said, could find no fault with such a study.

And to men like him, I said, when perfected by years and education, and to these only you will intrust the State.

Here Adeimantus interposed and said: To these statements, Socrates, no one can offer a reply; but when you talk in this way, a strange feeling passes over the minds of your hearers: They fancy that they are led astray a little at each step in the argument, owing to their own want of skill in asking and answering questions; these littles accumulate, and at the end of the discussion they are found to have sustained a mighty overthrow and all their former notions appear to be turned upside down. And as unskilful players of draughts are at last shut up by their more skilful adversaries and have no piece to move, so they too find themselves shut up at last; for they have nothing to say in this new game of which words are the counters; and yet all the time they are in the right. The observation is suggested to me by what is now occurring. For any one of us might say, that although in words he is not able to meet you at each step of the argument, he sees as a fact that the votaries of philosophy, when they carry on the study, not only in youth as a part of education, but as the pursuit of their maturer years, most of them become strange monsters, not to say utter rogues, and that those who may be considered the best of them are made useless to the world by the very study which you extol.

Well, and do you think that those who say so are wrong?

I cannot tell, he replied; but I should like to know what is your opinion.

Hear my answer; I am of opinion that they are quite right.

Then how can you be justified in saying that cities will not cease from evil until philosophers rule in them, when philosophers are acknowledged by us to be of no use to them?

You ask a question, I said, to which a reply can only be given in a parable.

Yes, Socrates; and that is a way of speaking to which you are not at all accustomed, I suppose.

I perceive, I said, that you are vastly amused at having plunged me into such a hopeless discussion; but now hear the parable, and then you will be still more amused at

the meagreness of my imagination: for the manner in which the best men are treated in their own States is so grievous that no single thing on earth is comparable to it; and therefore, if I am to plead their cause, I must have recourse to fiction, and put together a figure made up of many things, like the fabulous unions of goats and stags which are found in pictures. Imagine then a fleet or a ship in which there is a captain who is taller and stronger than any of the crew, but he is a little deaf and has a similar infirmity in sight, and his knowledge of navigation is not much better. The sailors are quarrelling with one another about the steering -- everyone is of opinion that he has a right to steer, though he has never learned the art of navigation and cannot tell who taught him or when he learned, and will further assert that it cannot be taught, and they are ready to cut in pieces anyone who says the contrary. They throng about the captain, begging and praying him to commit the helm to them; and if at any time they do not prevail, but others are preferred to them, they kill the others or throw them overboard, and having first chained up the noble captain's senses with drink or some narcotic drug, they mutiny and take possession of the ship and make free with the stores; thus, eating and drinking, they proceed on their voyage in such manner as might be expected of them. Him who is their partisan and cleverly aids them in their plot for getting the ship out of the captain's hands into their own whether by force or persuasion, they compliment with the name of sailor, pilot, able seaman, and abuse the other sort of man, whom they call a goodfornothing; but that the true pilot must pay attention to the year and seasons and sky and stars and winds, and whatever else belongs to his art, if he intends to be really qualified for the command of a ship, and that he must and will be the steerer, whether other people like or not -- the possibility of this union of authority with the steerer's art has never seriously entered into their thoughts or been made part of their calling. Now in vessels which are in a state of mutiny and by sailors who are mutineers, how will the true pilot be regarded? Will he not be called by them a prater, a stargazer, a goodfornothing?

Of course, said Adeimantus.

Then you will hardly need, I said, to hear the interpretation of the figure, which describes the true philosopher in his relation to the State; for you understand already.

Certainly.

Then suppose you now take this parable to the gentleman who is surprised at finding that philosophers have no honor in their cities; explain it to him and try to convince him that their having honor would be far more extraordinary.

I will.

Say to him, that, in deeming the best votaries of philosophy to be useless to the rest of the world, he is right; but also tell him to attribute their uselessness to the fault of those who will not use them, and not to

themselves. The pilot should not humbly beg the sailors to be commanded by him -- that is not the order of nature; neither are "the wise to go to the doors of the rich" -- the ingenious author of this saying told a lie -- but the truth is, that, when a man is ill, whether he be rich or poor, to the physician he must go, and he who wants to be governed, to him who is able to govern. The ruler who is good for anything ought not to beg his subjects to be ruled by him; although the present governors of mankind are of a different stamp; they may be justly compared to the mutinous sailors, and the true helmsmen to those who are called by them goodfornothings and stargazers.

Precisely so, he said.

For these reasons, and among men like these, philosophy, the noblest pursuit of all, is not likely to be much esteemed by those of the opposite faction; not that the greatest and most lasting injury is done to her by her opponents, but by her own professing followers, the same of whom you suppose the accuser to say that the greater number of them are arrant rogues, and the best are useless; in which opinion I agreed.

Yes.

And the reason why the good are useless has now been explained?

True.

Then shall we proceed to show that the corruption of the majority is also unavoidable, and that this is not to be laid to the charge of philosophy any more than the other?

By all means.

And let us ask and answer in turn, first going back to the description of the gentle and noble nature. Truth, as you will remember, was his leader, whom he followed always and in all things; failing in this, he was an impostor, and had no part or lot in true philosophy.

Yes, that was said.

Well, and is not this one quality, to mention no others, greatly at variance with present notions of him?

Certainly, he said.

And have we not a right to say in his defence, that the true lover of knowledge is always striving after being -- that is his nature; he will not rest in the multiplicity of individuals which is an appearance only, but will go on -- the keen edge will not be blunted, nor the force of his desire abate until he have attained the knowledge of the true nature of every essence by a sympathetic and kindred power in the soul, and by that power drawing near and mingling and becoming incorporate with very being, having begotten mind and truth, he will have knowledge and will live and grow truly, and then, and not till then, will he

cease from his travail.

Nothing, he said, can be more just than such a description of him.

And will the love of a lie be any part of a philosopher's nature? Will he not utterly hate a lie?

He will.

And when truth is the captain, we cannot suspect any evil of the band which he leads?

Impossible.

Justice and health of mind will be of the company, and temperance will follow after?

True, he replied.

Neither is there any reason why I should again set in array the philosopher's virtues, as you will doubtless remember that courage, magnificence, apprehension, memory, were his natural gifts. And you objected that, although no one could deny what I then said, still, if you leave words and look at facts, the persons who are thus described are some of them manifestly useless, and the greater number utterly depraved, we were then led to inquire into the grounds of these accusations, and have now arrived at the point of asking why are the majority bad, which question of necessity brought us back to the examination and definition of the true philosopher.

Exactly.

And we have next to consider the corruptions of the philosophic nature, why so many are spoiled and so few escape spoiling -- I am speaking of those who were said to be useless but not wicked -- and, when we have done with them, we will speak of the imitators of philosophy, what manner of men are they who aspire after a profession which is above them and of which they are unworthy, and then, by their manifold inconsistencies, bring upon philosophy and upon all philosophers that universal reprobation of which we speak.

What are these corruptions? he said.

I will see if I can explain them to you. Everyone will admit that a nature having in perfection all the qualities which we required in a philosopher is a rare plant which is seldom seen among men?

Rare indeed.

And what numberless and powerful causes tend to destroy these rare natures!

What causes?

In the first place there are their own virtues, their

courage, temperance, and the rest of them, every one of which praiseworthy qualities (and this is a most singular circumstance) destroys and distracts from philosophy the soul which is the possessor of them.

That is very singular, he replied.

Then there are all the ordinary goods of life -- beauty, wealth, strength, rank, and great connections in the State -- you understand the sort of things -- these also have a corrupting and distracting effect.

I understand; but I should like to know more precisely what you mean about them.

Grasp the truth as a whole, I said, and in the right way; you will then have no difficulty in apprehending the preceding remarks, and they will no longer appear strange to you.

And how am I to do so? he asked.

Why, I said, we know that all germs or seeds, whether vegetable or animal, when they fail to meet with proper nutriment, or climate, or soil, in proportion to their vigor, are all the more sensitive to the want of a suitable environment, for evil is a greater enemy to what is good than to what is not.

Very true.

There is reason in supposing that the finest natures, when under alien conditions, receive more injury than the inferior, because the contrast is greater.

Certainly.

And may we not say, Adeimantus, that the most gifted minds, when they are illeducated, become preeminently bad? Do not great crimes and the spirit of pure evil spring out of a fulness of nature ruined by education rather than from any inferiority, whereas weak natures are scarcely capable of any very great good or very great evil?

There I think that you are right.

And our philosopher follows the same analogy -- he is like a plant which, having proper nurture, must necessarily grow and mature into all virtue, but, if sown and planted in an alien soil, becomes the most noxious of all weeds, unless he be preserved by some divine power. Do you really think, as people so often say, that our youth are corrupted by Sophists, or that private teachers of the art corrupt them in any degree worth speaking of? Are not the public who say these things the greatest of all Sophists? And do they not educate to perfection young and old, men and women alike, and fashion them after their own hearts?

When is this accomplished? he said.

When they meet together, and the world sits down at an

assembly, or in a court of law, or a theatre, or a camp, or in any other popular resort, and there is a great uproar, and they praise some things which are being said or done, and blame other things, equally exaggerating both, shouting and clapping their hands, and the echo of the rocks and the place in which they are assembled redoubles the sound of the praise or blame -- at such a time will not a young man's heart, as they say, leap within him? Will any private training enable him to stand firm against the overwhelming flood of popular opinion? or will he be carried away by the stream? Will he not have the notions of good and evil which the public in general have -- he will do as they do, and as they are, such will he be?

Yes, Socrates; necessity will compel him.

And yet, I said, there is a still greater necessity, which has not been mentioned.

What is that?

The gentle force of attainder, or confiscation, or death, which, as you are aware, these new Sophists and educators, who are the public, apply when their words are powerless.

Indeed they do; and in right good earnest.

Now what opinion of any other Sophist, or of any private person, can be expected to overcome in such an unequal contest?

None, he replied.

No, indeed, I said, even to make the attempt is a great piece of folly; there neither is, nor has been, nor is ever likely to be, any different type of character which has had no other training in virtue but that which is supplied by public opinion -- I speak, my friend, of human virtue only; what is more than human, as the proverb says, is not included: for I would not have you ignorant that, in the present evil state of governments, whatever is saved and comes to good is saved by the power of God, as we may truly say.

I quite assent, he replied.

Then let me crave your assent also to a further observation.

What are you going to say?

Why, that all those mercenary individuals, whom the many call Sophists and whom they deem to be their adversaries, do, in fact, teach nothing but the opinion of the many, that is to say, the opinions of their assemblies; and this is their wisdom. I might compare them to a man who should study the tempers and desires of a mighty strong beast who is fed by him -- he would learn how to approach and handle him, also at what times and from what causes he is dangerous or the reverse, and what is the meaning of his

several cries, and by what sounds, when another utters them, he is soothed or infuriated; and you may suppose further, that when, by continually attending upon him, he has become perfect in all this, he calls his knowledge wisdom, and makes of it a system or art, which he proceeds to teach, although he has no real notion of what he means by the principles or passions of which he is speaking, but calls this honorable and that dishonorable, or good or evil, or just or unjust, all in accordance with the tastes and tempers of the great brute. Good he pronounces to be that in which the beast delights, and evil to be that which he dislikes; and he can give no other account of them except that the just and noble are the necessary, having never himself seen, and having no power of explaining to others, the nature of either, or the difference between them, which is immense. By heaven, would not such a one be a rare educator?

Indeed, he would.

And in what way does he who thinks that wisdom is the discernment of the tempers and tastes of the motley multitude, whether in painting or in music, or, finally, in politics, differ from him whom I have been describing? For when a man consorts with the many, and exhibits to them his poem or other work of art or the service which he has done the State, making them his judges when he is not obliged, the socalled necessity of Diomede will oblige him to produce whatever they praise. And yet the reasons are utterly ludicrous which they give in confirmation of their own notions about the honorable and good. Did you ever hear any of them which were not?

No, nor am I likely to hear.

You recognize the truth of what I have been saying? Then let me ask you to consider further whether the world will ever be induced to believe in the existence of absolute beauty rather than of the many beautiful, or of the absolute in each kind rather than of the many in each kind?

Certainly not.

Then the world cannot possibly be a philosopher?

Impossible.

And therefore philosophers must inevitably fall under the censure of the world?

They must.

And of individuals who consort with the mob and seek to please them?

That is evident.

Then, do you see any way in which the philosopher can be preserved in his calling to the end? -- and remember what we were saying of him, that he was to have quickness and memory and courage and magnificence -- these were admitted

by us to be the true philosopher's gifts.

Yes.

Will not such an one from his early childhood be in all things first among us all, especially if his bodily endowments are like his mental ones?

Certainly, he said.

And his friends and fellowcitizens will want to use him as he gets older for their own purposes?

No question.

Falling at his feet, they will make requests to him and do him honor and flatter him, because they want to get into their hands now the power which he will one day possess.

That often happens, he said.

And what will a man such as he is be likely to do under such circumstances, especially if he be a citizen of a great city, rich and noble, and a tall, proper youth? Will he not be full of boundless aspirations, and fancy himself able to manage the affairs of Hellenes and of barbarians, and having got such notions into his head will he not dilate and elevate himself in the fulness of vain pomp and senseless pride?

To be sure he will.

Now, when he is in this state of mind, if someone gently comes to him and tells him that he is a fool and must get understanding, which can only be got by slaving for it, do you think that, under such adverse circumstances, he will be easily induced to listen?

Far otherwise.

And even if there be someone who through inherent goodness or natural reasonableness has had his eyes opened a little and is humbled and taken captive by philosophy, how will his friends behave when they think that they are likely to lose the advantage which they were hoping to reap from his companionship? Will they not do and say anything to prevent him from yielding to his better nature and to render his teacher powerless, using to this end private intrigues as well as public prosecutions?

There can be no doubt of it.

And how can one who is thus circumstanced ever become a philosopher?

Impossible.

Then were we not right in saying that even the very qualities which make a man a philosopher, may, if he be illeducated, divert him from philosophy, no less than riches and their accompaniments and the other socalled goods of

life?

We were quite right.

Thus, my excellent friend, is brought about all that ruin and failure which I have been describing of the natures best adapted to the best of all pursuits; they are natures which we maintain to be rare at any time; this being the class out of which come the men who are the authors of the greatest evil to States and individuals; and also of the greatest good when the tide carries them in that direction; but a small man never was the doer of any great thing either to individuals or to States.

That is most true, he said.

And so philosophy is left desolate, with her marriage rite incomplete: for her own have fallen away and forsaken her, and while they are leading a false and unbecoming life, other unworthy persons, seeing that she has no kinsmen to be her protectors, enter in and dishonor her; and fasten upon her the reproaches which, as you say, her reprovers utter, who affirm of her votaries that some are good for nothing, and that the greater number deserve the severest punishment.

That is certainly what people say.

Yes; and what else would you expect, I said, when you think of the puny creatures who, seeing this land open to them -- a land well stocked with fair names and showy titles -- like prisoners running out of prison into a sanctuary, take a leap out of their trades into philosophy; those who do so being probably the cleverest hands at their own miserable crafts? For, although philosophy be in this evil case, still there remains a dignity about her which is not to be found in the arts. And many are thus attracted by her whose natures are imperfect and whose souls are maimed and disfigured by their meannesses, as their bodies are by their trades and crafts. Is not this unavoidable?

Yes.

Are they not exactly like a bald little tinker who has just got out of durance and come into a fortune -- he takes a bath and puts on a new coat, and is decked out as a bridegroom going to marry his master's daughter, who is left poor and desolate?

A most exact parallel.

What will be the issue of such marriages? Will they not be vile and bastard?

There can be no question of it.

And when persons who are unworthy of education approach philosophy and make an alliance with her who is in a rank above them, what sort of ideas and opinions are likely to be generated? Will they not be sophisms captivating to the ear, having nothing in them genuine, or worthy of or akin to true wisdom?

No doubt, he said.

Then, Adeimantus, I said, the worthy disciples of philosophy will be but a small remnant: perchance some noble and welleducated person, detained by exile in her service, who in the absence of corrupting influences remains devoted to her; or some lofty soul born in a mean city, the politics of which he contemns and neglects; and there may be a gifted few who leave the arts, which they justly despise, and come to her; or peradventure there are some who are restrained by our friend Theages's bridle; for everything in the life of Theages conspired to divert him from philosophy; but illhealth kept him away from politics. My own case of the internal sign is hardly worth mentioning, for rarely, if ever, has such a monitor been given to any other man. Those who belong to this small class have tasted how sweet and blessed a possession philosophy is, and have also seen enough of the madness of the multitude; and they know that no politician is honest, nor is there any champion of justice at whose side they may fight and be saved. Such a one may be compared to a man who has fallen among wild beasts -- he will not join in the wickedness of his fellows, but neither is he able singly to resist all their fierce natures, and therefore seeing that he would be of no use to the State or to his friends, and reflecting that he would have to throw away his life without doing any good either to himself or others, he holds his peace, and goes his own way. He is like one who, in the storm of dust and sleet which the driving wind hurries along, retires under the shelter of a wall; and seeing the rest of mankind full of wickedness, he is content, if only he can live his own life and be pure from evil or unrighteousness, and depart in peace and goodwill, with bright hopes.

Yes, he said, and he will have done a great work before he departs.

A great work -- yes; but not the greatest, unless he find a State suitable to him; for in a State which is suitable to him, he will have a larger growth and be the saviour of his country, as well as of himself.

The causes why philosophy is in such an evil name have now been sufficiently explained: the injustice of the charges against her has been shown -- is there anything more which you wish to say?

Nothing more on that subject, he replied; but I should like to know which of the governments now existing is in your opinion the one adapted to her.

Not any of them, I said; and that is precisely the accusation which I bring against them -- not one of them is worthy of the philosophic nature, and hence that nature is warped and estranged; as the exotic seed which is sown in a foreign land becomes denaturalized, and is wont to be overpowered and to lose itself in the new soil, even so this growth of philosophy, instead of persisting, degenerates and receives another character. But if philosophy ever finds in the State that perfection which she herself is, then will be

seen that she is in truth divine, and that all other things, whether natures of men or institutions, are but human; and now, I know that you are going to ask, What that State is:

No, he said; there you are wrong, for I was going to ask another question -- whether it is the State of which we are the founders and inventors, or some other?

Yes, I replied, ours in most respects; but you may remember my saying before, that some living authority would always be required in the State having the same idea of the constitution which guided you when as legislator you were laying down the laws.

That was said, he replied.

Yes, but not in a satisfactory manner; you frightened us by interposing objections, which certainly showed that the discussion would be long and difficult; and what still remains is the reverse of easy.

What is there remaining?

The question how the study of philosophy may be so ordered as not to be the ruin of the State: All great attempts are attended with risk; "hard is the good," as men say.

Still, he said, let the point be cleared up, and the inquiry will then be complete.

I shall not be hindered, I said, by any want of will, but, if at all, by a want of power: my zeal you may see for yourselves; and please to remark in what I am about to say how boldly and unhesitatingly I declare that States should pursue philosophy, not as they do now, but in a different spirit.

In what manner?

At present, I said, the students of philosophy are quite young; beginning when they are hardly past childhood, they devote only the time saved from moneymaking and housekeeping to such pursuits; and even those of them who are reputed to have most of the philosophic spirit, when they come within sight of the great difficulty of the subject, I mean dialectic, take themselves off. In after life, when invited by someone else, they may, perhaps, go and hear a lecture, and about this they make much ado, for philosophy is not considered by them to be their proper business: at last, when they grow old, in most cases they are extinguished more truly than Heracleitus's sun, inasmuch as they never light up again.

But what ought to be their course?

Just the opposite. In childhood and youth their study, and what philosophy they learn, should be suited to their tender years: during this period while they are growing up toward manhood, the chief and special care should be given to their bodies that they may have them to use in the

service of philosophy; as life advances and the intellect begins to mature, let them increase the gymnastics of the soul; but when the strength of our citizens fails and is past civil and military duties, then let them range at will and engage in no serious labor, as we intend them to live happily here, and to crown this life with a similar happiness in another.

How truly in earnest you are, Socrates! he said; I am sure of that; and yet most of your hearers, if I am not mistaken, are likely to be still more earnest in their opposition to you, and will never be convinced; Thrasymachus least of all.

Do not make a quarrel, I said, between Thrasymachus and me, who have recently become friends, although, indeed, we were never enemies; for I shall go on striving to the utmost until I either convert him and other men, or do something which may profit them against the day when they live again, and hold the like discourse in another state of existence.

You are speaking of a time which is not very near.

Rather, I replied, of a time which is as nothing in comparison with eternity. Nevertheless, I do not wonder that the many refuse to believe; for they have never seen that of which we are now speaking realized; they have seen only a conventional imitation of philosophy, consisting of words artificially brought together, not like these of ours having a natural unity. But a human being who in word and work is perfectly moulded, as far as he can be, into the proportion and likeness of virtue -- such a man ruling in a city which bears the same image, they have never yet seen, neither one nor many of them -- do you think that they ever did?

No indeed.

No, my friend, and they have seldom, if ever, heard free and noble sentiments; such as men utter when they are earnestly and by every means in their power seeking after truth for the sake of knowledge, while they look coldly on the subtleties of controversy, of which the end is opinion and strife, whether they meet with them in the courts of law or in society.

They are strangers, he said, to the words of which you speak.

And this was what we foresaw, and this was the reason why truth forced us to admit, not without fear and hesitation, that neither cities nor States nor individuals will ever attain perfection until the small class of philosophers whom we termed useless but not corrupt are providentially compelled, whether they will or not, to take care of the State, and until a like necessity be laid on the State to obey them; or until kings, or if not kings, the sons of kings or princes, are divinely inspired with a true love of true philosophy. That either or both of these alternatives are impossible, I see no reason to affirm: if they were so, we might indeed be justly ridiculed as dreamers and visionaries. Am I not right?

Quite right.

If then, in the countless ages of the past, or at the present hour in some foreign clime which is far away and beyond our ken, the perfected philosopher is or has been or hereafter shall be compelled by a superior power to have the charge of the State, we are ready to assert to the death, that this our constitution has been, and is -- yea, and will be whenever the muse of philosophy is queen. There is no impossibility in all this; that there is a difficulty, we acknowledge ourselves.

My opinion agrees with yours, he said.

But do you mean to say that this is not the opinion of the multitude?

I should imagine not, he replied.

O my friends, I said, do not attack the multitude: they will change their minds, if, not in an aggressive spirit, but gently and with the view of soothing them and removing their dislike of overeducation, you show them your philosophers as they really are and describe as you were just now doing their character and profession, and then mankind will see that he of whom you are speaking is not such as they supposed -- if they view him in this new light, they will surely change their notion of him, and answer in another strain. Who can be at enmity with one who loves him, who that is himself gentle and free from envy will be jealous of one in whom there is no jealousy? Nay, let me answer for you, that in a few this harsh temper may be found, but not in the majority of mankind.

I quite agree with you, he said.

And do you not also think, as I do, that the harsh feeling which the many entertain toward philosophy originates in the pretenders, who rush in uninvited, and are always abusing them, and finding fault with them, who make persons instead of things the theme of their conversation? and nothing can be more unbecoming in philosophers than this.

It is most unbecoming.

For he, Adeimantus, whose mind is fixed upon true being, has surely no time to look down upon the affairs of earth, or to be filled with malice and envy, contending against men; his eye is ever directed toward things fixed and immutable, which he sees neither injuring nor injured by one another, but all in order moving according to reason; these he imitates, and to these he will, as far as he can, conform himself. Can a man help imitating that with which he holds reverential converse?

Impossible.

And the philosopher holding converse with the divine order, becomes orderly and divine, as far as the nature of

man allows; but like everyone else, he will suffer from detraction.

Of course.

And if a necessity be laid upon him of fashioning, not only himself, but human nature generally, whether in States or individuals, into that which he beholds elsewhere, will be, think you, be an unskilful artificer of justice, temperance, and every civil virtue?

Anything but unskilful.

And if the world perceives that what we are saying about him is the truth, will they be angry with philosophy? Will they disbelieve us, when we tell them that no State can be happy which is not designed by artists who imitate the heavenly pattern?

They will not be angry if they understand, he said. But how will they draw out the plan of which you are speaking?

They will begin by taking the State and the manners of men, from which, as from a tablet, they will rub out the picture, and leave a clean surface. This is no easy task. But whether easy or not, herein will lie the difference between them and every other legislator -- they will have nothing to do either with individual or State, and will inscribe no laws, until they have either found, or themselves made, a clean surface.

They will be very right, he said.

Having effected this, they will proceed to trace an outline of the constitution?

No doubt.

And when they are filling in the work, as I conceive, they will often turn their eyes upward and downward: I mean that they will first look at absolute justice and beauty and temperance, and again at the human copy; and will mingle and temper the various elements of life into the image of a man; and this they will conceive according to that other image, which, when existing among men, Homer calls the form and likeness of God.

Very true, he said.

And one feature they will erase, and another they will put in, until they have made the ways of men, as far as possible, agreeable to the ways of God?

Indeed, he said, in no way could they make a fairer picture.

And now, I said, are we beginning to persuade those whom you described as rushing at us with might and main, that the painter of constitutions is such a one as we were praising; at whom they were so very indignant because to his hands we committed the State; and are they growing a little

calmer at what they have just heard?

Much calmer, if there is any sense in them.

Why, where can they still find any ground for objection? Will they doubt that the philosopher is a lover of truth and being?

They would not be so unreasonable.

Or that his nature, being such as we have delineated, is akin to the highest good?

Neither can they doubt this.

But again, will they tell us that such a nature, placed under favorable circumstances, will not be perfectly good and wise if any ever was? Or will they prefer those whom we have rejected?

Surely not.

Then will they still be angry at our saying, that, until philosophers bear rule, States and individuals will have no rest from evil, nor will this our imaginary State ever be realized?

I think that they will be less angry.

Shall we assume that they are not only less angry but quite gentle, and that they have been converted and for very shame, if for no other reason, cannot refuse to come to terms?

By all means, he said.

Then let us suppose that the reconciliation has been effected. Will anyone deny the other point, that there may be sons of kings or princes who are by nature philosophers?

Surely no man, he said.

And when they have come into being will anyone say that they must of necessity be destroyed; that they can hardly be saved is not denied even by us; but that in the whole course of ages no single one of them can escape -- who will venture to affirm this?

Who indeed!

But, said I, one is enough; let there be one man who has a city obedient to his will, and he might bring into existence the ideal polity about which the world is so incredulous.

Yes, one is enough.

The ruler may impose the laws and institutions which we have been describing, and the citizens may possibly be willing to obey them?

Certainly.

And that others should approve, of what we approve, is no miracle or impossibility?

I think not.

But we have sufficiently shown, in what has preceded, that all this, if only possible, is assuredly for the best.

We have.

And now we say not only that our laws, if they could be enacted, would be for the best, but also that the enactment of them, though difficult, is not impossible.

Very good.

And so with pain and toil we have reached the end of one subject, but more remains to be discussed; how and by what studies and pursuits will the saviours of the constitution be created, and at what ages are they to apply themselves to their several studies?

Certainly.

I omitted the troublesome business of the possession of women, and the procreation of children, and the appointment of the rulers, because I knew that the perfect State would be eyed with jealousy and was difficult of attainment; but that piece of cleverness was not of much service to me, for I had to discuss them all the same. The women and children are now disposed of, but the other question of the rulers must be investigated from the very beginning. We were saying, as you will remember, that they were to be lovers of their country, tried by the test of pleasures and pains, and neither in hardships, nor in dangers, nor at any other critical moment were to lose their patriotism -- he was to be rejected who failed, but he who always came forth pure, like gold tried in the refiner's fire, was to be made a ruler, and to receive honors and rewards in life and after death. This was the sort of thing which was being said, and then the argument turned aside and veiled her face; not liking to stir the question which has now arisen.

I perfectly remember, he said.

Yes, my friend, I said, and I then shrank from hazarding the bold word; but now let me dare to say -- that the perfect guardian must be a philosopher.

Yes, he said, let that be affirmed.

And do not suppose that there will be many of them; for the gifts which were deemed by us to be essential rarely grow together; they are mostly found in shreds and patches.

What do you mean? he said.

You are aware, I replied, that quick intelligence, memory, sagacity, cleverness, and similar qualities, do not

often grow together, and that persons who possess them and are at the same time highspirited and magnanimous are not so constituted by nature as to live orderly and in a peaceful and settled manner; they are driven any way by their impulses, and all solid principle goes out of them.

Very true, he said.

On the other hand, those steadfast natures which can better be depended upon, which in a battle are impregnable to fear and immovable, are equally immovable when there is anything to be learned; they are always in a torpid state, and are apt to yawn and go to sleep over any intellectual toil.

Quite true.

And yet we were saying that both qualities were necessary in those to whom the higher education is to be imparted, and who are to share in any office or command.

Certainly, he said.

And will they be a class which is rarely found?

Yes, indeed.

Then the aspirant must not only be tested in those labors and dangers and pleasures which we mentioned before, but there is another kind of probation which we did not mention -- he must be exercised also in many kinds of knowledge, to see whether the soul will be able to endure the highest of all, or will faint under them, as in any other studies and exercises.

Yes, he said, you are quite right in testing them. But what do you mean by the highest of all knowledge?

You may remember, I said, that we divided the soul into three parts; and distinguished the several natures of justice, temperance, courage, and wisdom?

Indeed, he said, if I had forgotten, I should not deserve to hear more.

And do you remember the word of caution which preceded the discussion of them?

To what do you refer?

We were saying, if I am not mistaken, that he who wanted to see them in their perfect beauty must take a longer and more circuitous way, at the end of which they would appear; but that we could add on a popular exposition of them on a level with the discussion which had preceded. And you replied that such an exposition would be enough for you, and so the inquiry was continued in what to me seemed to be a very inaccurate manner; whether you were satisfied or not, it is for you to say.

Yes, he said, I thought and the others thought that you

gave us a fair measure of truth.

But, my friend, I said, a measure of such things which in any degree falls short of the whole truth is not fair measure; for nothing imperfect is the measure of anything, although persons are too apt to be contented and think that they need search no further.

Not an uncommon case when people are indolent.

Yes, I said; and there cannot be any worse fault in a guardian of the State and of the laws.

True.

The guardian then, I said, must be required to take the longer circuit, and toil at learning as well as at gymnastics, or he will never reach the highest knowledge of all which, as we were just now saying, is his proper calling.

What, he said, is there a knowledge still higher than this -- higher than justice and the other virtues?

Yes, I said, there is. And of the virtues too we must behold not the outline merely, as at present -- nothing short of the most finished picture should satisfy us. When little things are elaborated with an infinity of pains, in order that they may appear in their full beauty and utmost clearness, how ridiculous that we should not think the highest truths worthy of attaining the highest accuracy!

A right noble thought; but do you suppose that we shall refrain from asking you what is this highest knowledge?

Nay, I said, ask if you will; but I am certain that you have heard the answer many times, and now you either do not understand me or, as I rather think, you are disposed to be troublesome; for you have often been told that the idea of good is the highest knowledge, and that all other things become useful and advantageous only by their use of this. You can hardly be ignorant that of this I was about to speak, concerning which, as you have often heard me say, we know so little; and, without which, any other knowledge or possession of any kind will profit us nothing. Do you think that the possession of all other things is of any value if we do not possess the good? or the knowledge of all other things if we have no knowledge of beauty and goodness?

Assuredly not.

You are further aware that most people affirm pleasure to be the good, but the finer sort of wits say it is knowledge?

Yes.

And you are aware too that the latter cannot explain what they mean by knowledge, but are obliged after all to say knowledge of the good?

How ridiculous!

Yes, I said, that they should begin by reproaching us with our ignorance of the good, and then presume our knowledge of it -- for the good they define to be knowledge of the good, just as if we understood them when they use the term "good" -- this is of course ridiculous.

Most true, he said.

And those who make pleasure their good are in equal perplexity; for they are compelled to admit that there are bad pleasures as well as good.

Certainly.

And therefore to acknowledge that bad and good are the same?

True.

There can be no doubt about the numerous difficulties in which this question is involved.

There can be none.

Further, do we not see that many are willing to do or to have or to seem to be what is just and honorable without the reality; but no one is satisfied with the appearance of good -- the reality is what they seek; in the case of the good, appearance is despised by everyone.

Very true, he said.

Of this then, which every soul of man pursues and makes the end of all his actions, having a presentiment that there is such an end, and yet hesitating because neither knowing the nature nor having the same assurance of this as of other things, and therefore losing whatever good there is in other things -- of a principle such and so great as this ought the best men in our State, to whom everything is intrusted, to be in the darkness of ignorance?

Certainly not, he said.

I am sure, I said, that he who does not know how the beautiful and the just are likewise good will be but a sorry guardian of them; and I suspect that no one who is ignorant of the good will have a true knowledge of them.

That, he said, is a shrewd suspicion of yours.

And if we only have a guardian who has this knowledge, our State will be perfectly ordered?

Of course, he replied; but I wish that you would tell me whether you conceive this supreme principle of the good to be knowledge or pleasure, or different from either?

Aye, I said, I knew all along that a fastidious gentleman like you would not be contented with the thoughts

of other people about these matters.

True, Socrates; but I must say that one who like you has passed a lifetime in the study of philosophy should not be always repeating the opinions of others, and never telling his own.

Well, but has anyone a right to say positively what he does not know?

Not, he said, with the assurance of positive certainty; he has no right to do that: but he may say what he thinks, as a matter of opinion.

And do you not know, I said, that all mere opinions are bad, and the best of them blind? You would not deny that those who have any true notion without intelligence are only like blind men who feel their way along the road?

Very true.

And do you wish to behold what is blind and crooked and base, when others will tell you of brightness and beauty?

Still, I must implore you, Socrates, said Glaucon, not to turn away just as you are reaching the goal; if you will only give such an explanation of the good as you have already given of justice and temperance and the other virtues, we shall be satisfied.

Yes, my friend, and I shall be at least equally satisfied, but I cannot help fearing that I shall fail, and that my indiscreet zeal will bring ridicule upon me. No, sweet sirs, let us not at present ask what is the actual nature of the good, for to reach what is now in my thoughts would be an effort too great for me. But of the child of the good who is likest him, I would fain speak, if I could be sure that you wished to hear -- otherwise, not.

By all means, he said, tell us about the child, and you shall remain in our debt for the account of the parent.

I do indeed wish, I replied, that I could pay, and you receive, the account of the parent, and not, as now, of the offspring only; take, however, this latter by way of interest, and at the same time have a care that I do not render a false account, although I have no intention of deceiving you.

Yes, we will take all the care that we can: proceed.

Yes, I said, but I must first come to an understanding with you, and remind you of what I have mentioned in the course of this discussion, and at many other times.

What?

The old story, that there is many a beautiful and many a good, and so of other things which we describe and define; to all of them the term "many" is implied.

True, he said.

And there is an absolute beauty and an absolute good, and of other things to which the term "many" is applied there is an absolute; for they may be brought under a single idea, which is called the essence of each.

Very true.

The many, as we say, are seen but not known, and the ideas are known but not seen.

Exactly.

And what is the organ with which we see the visible things?

The sight, he said.

And with the hearing, I said, we hear, and with the other senses perceive the other objects of sense?

True.

But have you remarked that sight is by far the most costly and complex piece of workmanship which the artificer of the senses ever contrived?

No, I never have, he said.

Then reflect: has the ear or voice need of any third or additional nature in order that the one may be able to hear and the other to be heard?

Nothing of the sort.

No, indeed, I replied; and the same is true of most, if not all, the other senses -- you would not say that any of them requires such an addition?

Certainly not.

But you see that without the addition of some other nature there is no seeing or being seen?

How do you mean?

Sight being, as I conceive, in the eyes, and he who has eyes wanting to see; color being also present in them, still unless there be a third nature specially adapted to the purpose, the owner of the eyes will see nothing and the colors will be invisible.

Of what nature are you speaking?

Of that which you term light, I replied.

True, he said.

Noble, then, is the bond which links together sight and visibility, and great beyond other bonds by no small

difference of nature; for light is their bond, and light is no ignoble thing?

Nay, he said, the reverse of ignoble.

And which, I said, of the gods in heaven would you say was the lord of this element? Whose is that light which makes the eye to see perfectly and the visible to appear?

You mean the sun, as you and all mankind say.

May not the relation of sight to this deity be described as follows?

How?

Neither sight nor the eye in which sight resides is the sun?

No.

Yet of all the organs of sense the eye is the most like the sun?

By far the most like.

And the power which the eye possesses is a sort of effluence which is dispensed from the sun?

Exactly.

Then the sun is not sight, but the author of sight who is recognized by sight?

True, he said.

And this is he whom I call the child of the good, whom the good begat in his own likeness, to be in the visible world, in relation to sight and the things of sight, what the good is in the intellectual world in relation to mind and the things of mind:

Will you be a little more explicit? he said.

Why, you know, I said, that the eyes, when a person directs them toward objects on which the light of day is no longer shining, but the moon and stars only, see dimly, and are nearly blind; they seem to have no clearness of vision in them?

Very true.

But when they are directed toward objects on which the sun shines, they see clearly and there is sight in them?

Certainly.

And the soul is like the eye: when resting upon that on which truth and being shine, the soul perceives and understands, and is radiant with intelligence; but when turned toward the twilight of becoming and perishing, then

she has opinion only, and goes blinking about, and is first of one opinion and then of another, and seems to have no intelligence?

Just so.

Now, that which imparts truth to the known and the power of knowing to the knower is what I would have you term the idea of good, and this you will deem to be the cause of science, and of truth in so far as the latter becomes the subject of knowledge; beautiful too, as are both truth and knowledge, you will be right in esteeming this other nature as more beautiful than either; and, as in the previous instance, light and sight may be truly said to be like the sun, and yet not to be the sun, so in this other sphere, science and truth may be deemed to be like the good, but not the good; the good has a place of honor yet higher.

What a wonder of beauty that must be, he said, which is the author of science and truth, and yet surpasses them in beauty; for you surely cannot mean to say that pleasure is the good?

God forbid, I replied; but may I ask you to consider the image in another point of view?

In what point of view?

You would say, would you not? that the sun is not only the author of visibility in all visible things, but of generation and nourishment and growth, though he himself is not generation?

Certainly.

In like manner the good may be said to be not only the author of knowledge to all things known, but of their being and essence, and yet the good is not essence, but far exceeds essence in dignity and power.

Glaucon said, with a ludicrous earnestness: By the light of heaven, how amazing!

Yes, I said, and the exaggeration may be set down to you; for you made me utter my fancies.

And pray continue to utter them; at any rate let us hear if there is anything more to be said about the similitude of the sun.

Yes, I said, there is a great deal more.

Then omit nothing, however slight.

I will do my best, I said; but I should think that a great deal will have to be omitted. I hope not, he said.

You have to Imagine, then, that there are two ruling powers, and that one of them is set over the intellectual world, the other over the visible. I do not say heaven, lest you should fancy that I am playing upon the name (ovpavos,

opatos). May I suppose that you have this distinction of the visible and intelligible fixed in your mind?

I have.

Now take a line which has been cut into two unequal parts, and divide each of them again in the same proportion, and suppose the two main divisions to answer, one to the visible and the other to the intelligible, and then compare the subdivisions in respect of their clearness and want of clearness, and you will find that the first section in the sphere of the visible consists of images. And by images I mean, in the first place, shadows, and in the second place, reflections in water and in solid, smooth and polished bodies and the like: Do you understand?

Yes, I understand.

Imagine, now, the other section, of which this is only the resemblance, to include the animals which we see, and everything that grows or is made.

Very good.

Would you not admit that both the sections of this division have different degrees of truth, and that the copy is to the original as the sphere of opinion is to the sphere of knowledge?

Most undoubtedly.

Next proceed to consider the manner in which the sphere of the intellectual is to be divided.

In what manner?

Thus: There are two subdivisions, in the lower of which the soul uses the figures given by the former division as images; the inquiry can only be hypothetical, and instead of going upward to a principle descends to the other end; in the higher of the two, the soul passes out of hypotheses, and goes up to a principle which is above hypotheses, making no use of images as in the former case, but proceeding only in and through the ideas themselves.

I do not quite understand your meaning, he said.

Then I will try again; you will understand me better when I have made some preliminary remarks. You are aware that students of geometry, arithmetic, and the kindred sciences assume the odd, and the even, and the figures, and three kinds of angles, and the like, in their several branches of science; these are their hypotheses, which they and everybody are supposed to know, and therefore they do not deign to give any account of them either to themselves or others; but they begin with them, and go on until they arrive at last, and in a consistent manner, at their conclusion?

Yes, he said, I know.

And do you not know also that although they make use of the visible forms and reason about them, they are thinking not of these, but of the ideals which they resemble; not of the figures which they draw, but of the absolute square and the absolute diameter, and so on -- the forms which they draw or make, and which have shadows and reflections in water of their own, are converted by them into images, but they are really seeking to behold the things themselves, which can only be seen with the eye of the mind?

That is true.

And of this kind I spoke as the intelligible, although in the search after it the soul is compelled to use hypotheses; not ascending to a first principle, because she is unable to rise above the region of hypothesis, but employing the objects of which the shadows below are resemblances in their turn as images, they having in relation to the shadows and reflections of them a greater distinctness, and therefore a higher value.

I understand, he said, that you are speaking of the province of geometry and the sister arts.

And when I speak of the other division of the intelligible, you will understand me to speak of that other sort of knowledge which reason herself attains by the power of dialectic, using the hypotheses not as first principles, but only as hypotheses -- that is to say, as steps and points of departure into a world which is above hypotheses, in order that she may soar beyond them to the first principle of the whole; and clinging to this and then to that which depends on this, by successive steps she descends again without the aid of any sensible object, from ideas, through ideas, and in ideas she ends.

I understand you, he replied; not perfectly, for you seem to me to be describing a task which is really tremendous; but, at any rate, I understand you to say that knowledge and being, which the science of dialectic contemplates, are clearer than the notions of the arts, as they are termed, which proceed from hypotheses only: these are also contemplated by the understanding, and not by the senses: yet, because they start from hypotheses and do not ascend to a principle, those who contemplate them appear to you not to exercise the higher reason upon them, although when a first principle is added to them they are cognizable by the higher reason. And the habit which is concerned with geometry and the cognate sciences I suppose that you would term understanding, and not reason, as being intermediate between opinion and reason.

You have quite conceived my meaning, I said; and now, corresponding to these four divisions, let there be four faculties in the soul -- reason answering to the highest, understanding to the second, faith (or conviction) to the third, and perception of shadows to the last -- and let there be a scale of them, and let us suppose that the several faculties have clearness in the same degree that their objects have truth.

I understand, he replied, and give my assent, and accept your arrangement.

* * * *

Book VII: On Shadows And Realities In Education

(Socrates, Glaucon.)

AND now, I said, let me show in a figure how far our nature is enlightened or unenlightened: Behold! human beings living in an underground den, which has a mouth open toward the light and reaching all along the den; here they have been from their childhood, and have their legs and necks chained so that they cannot move, and can only see before them, being prevented by the chains from turning round their heads. Above and behind them a fire is blazing at a distance, and between the fire and the prisoners there is a raised way; and you will see, if you look, a low wall built along the way, like the screen which marionetteplayers have in front of them, over which they show the puppets.

I see.

And do you see, I said, men passing along the wall carrying all sorts of vessels, and statues and figures of animals made of wood and stone and various materials, which appear over the wall? Some of them are talking, others silent.

You have shown me a strange image, and they are strange prisoners.

Like ourselves, I replied; and they see only their own shadows, or the shadows of one another, which the fire throws on the opposite wall of the cave?

True, he said; how could they see anything but the shadows if they were never allowed to move their heads?

And of the objects which are being carried in like manner they would only see the shadows?

Yes, he said.

And if they were able to converse with one another, would they not suppose that they were naming what was actually before them?

Very true.

And suppose further that the prison had an echo which came from the other side, would they not be sure to fancy when one of the passersby spoke that the voice which they heard came from the passing shadow?

No question, he replied.

To them, I said, the truth would be literally nothing but the shadows of the images.

That is certain.

And now look again, and see what will naturally follow if the prisoners are released and disabused of their error. At first, when any of them is liberated and compelled suddenly to stand up and turn his neck round and walk and look toward the light, he will suffer sharp pains; the glare will distress him, and he will be unable to see the realities of which in his former state he had seen the shadows; and then conceive someone saying to him, that what he saw before was an illusion, but that now, when he is approaching nearer to being and his eye is turned toward more real existence, he has a clearer vision -- what will be his reply? And you may further imagine that his instructor is pointing to the objects as they pass and requiring him to name them -- will he not be perplexed? Will he not fancy that the shadows which he formerly saw are truer than the objects which are now shown to him?

Far truer.

And if he is compelled to look straight at the light, will he not have a pain in his eyes which will make him turn away to take refuge in the objects of vision which he can see, and which he will conceive to be in reality clearer than the things which are now being shown to him?

True, he said.

And suppose once more, that he is reluctantly dragged up a steep and rugged ascent, and held fast until he is forced into the presence of the sun himself, is he not likely to be pained and irritated? When he approaches the light his eyes will be dazzled, and he will not be able to see anything at all of what are now called realities.

Not all in a moment, he said.

He will require to grow accustomed to the sight of the upper world. And first he will see the shadows best, next the reflections of men and other objects in the water, and then the objects themselves; then he will gaze upon the light of the moon and the stars and the spangled heaven; and he will see the sky and the stars by night better than the sun or the light of the sun by day?

Certainly.

Last of all he will be able to see the sun, and not mere reflections of him in the water, but he will see him in his own proper place, and not in another; and he will contemplate him as he is.

Certainly.

He will then proceed to argue that this is he who gives the season and the years, and is the guardian of all that is in the visible world, and in a certain way the cause of all things which he and his fellows have been accustomed to behold?

Clearly, he said, he would first see the sun and then reason about him.

And when he remembered his old habitation, and the wisdom of the den and his fellowprisoners, do you not suppose that he would felicitate himself on the change, and pity him?

Certainly, he would.

And if they were in the habit of conferring honors among themselves on those who were quickest to observe the passing shadows and to remark which of them went before, and which followed after, and which were together; and who were therefore best able to draw conclusions as to the future, do you think that he would care for such honors and glories, or envy the possessors of them? Would he not say with Homer,

"Better to be the poor servant of a poor master,"

and to endure anything, rather than think as they do and live after their manner?

Yes, he said, I think that he would rather suffer anything than entertain these false notions and live in this miserable manner.

Imagine once more, I said, such a one coming suddenly out of the sun to be replaced in his old situation; would he not be certain to have his eyes full of darkness?

To be sure, he said.

And if there were a contest, and he had to compete in measuring the shadows with the prisoners who had never moved out of the den, while his sight was still weak, and before his eyes had become steady (and the time which would be needed to acquire this new habit of sight might be very considerable), would he not be ridiculous? Men would say of him that up he went and down he came without his eyes; and that it was better not even to think of ascending; and if anyone tried to loose another and lead him up to the light, let them only catch the offender, and they would put him to death.

No question, he said.

This entire allegory, I said, you may now append, dear Glaucon, to the previous argument; the prisonhouse is the world of sight, the light of the fire is the sun, and you will not misapprehend me if you interpret the journey upward to be the ascent of the soul into the intellectual world according to my poor belief, which, at your desire, I have expressed -- whether rightly or wrongly, God knows. But, whether true or false, my opinion is that in the world of knowledge the idea of good appears last of all, and is seen only with an effort; and, when seen, is also inferred to be the universal author of all things beautiful and right, parent of light and of the lord of light in this visible world, and the immediate source of reason and truth in the intellectual; and that this is the power upon which he who

would act rationally either in public or private life must have his eye fixed.

I agree, he said, as far as I am able to understand you.

Moreover, I said, you must not wonder that those who attain to this beatific vision are unwilling to descend to human affairs; for their souls are ever hastening into the upper world where they desire to dwell; which desire of theirs is very natural, if our allegory may be trusted.

Yes, very natural.

And is there anything surprising in one who passes from divine contemplations to the evil state of man, misbehaving himself in a ridiculous manner; if, while his eyes are blinking and before he has become accustomed to the surrounding darkness, he is compelled to fight in courts of law, or in other places, about the images or the shadows of images of justice, and is endeavoring to meet the conceptions of those who have never yet seen absolute justice?

Anything but surprising, he replied. Anyone who has commonsense will remember that the bewilderments of the eyes are of two kinds, and arise from two causes, either from coming out of the light or from going into the light, which is true of the mind's eye, quite as much as of the bodily eye; and he who remembers this when he sees anyone whose vision is perplexed and weak, will not be too ready to laugh; he will first ask whether that soul of man has come out of the brighter life, and is unable to see because unaccustomed to the dark, or having turned from darkness to the day is dazzled by excess of light. And he will count the one happy in his condition and state of being, and he will pity the other; or, if he have a mind to laugh at the soul which comes from below into the light, there will be more reason in this than in the laugh which greets him who returns from above out of the light into the den.

That, he said, is a very just distinction.

But then, if I am right, certain professors of education must be wrong when they say that they can put a knowledge into the soul which was not there before, like sight into blind eyes.

They undoubtedly say this, he replied.

Whereas, our argument shows that the power and capacity of learning exists in the soul already; and that just as the eye was unable to turn from darkness to light without the whole body, so too the instrument of knowledge can only by the movement of the whole soul be turned from the world of becoming into that of being, and learn by degrees to endure the sight of being, and of the brightest and best of being, or, in other words, of the good.

Very true.

And must there not be some art which will effect conversion in the easiest and quickest manner; not implanting the faculty of sight, for that exists already, but has been turned in the wrong direction, and is looking away from the truth?

Yes, he said, such an art may be presumed.

And whereas the other socalled virtues of the soul seem to be akin to bodily qualities, for even when they are not originally innate they can be implanted later by habit and exercise, the virtue of wisdom more than anything else contains a divine element which always remains, and by this conversion is rendered useful and profitable; or, on the other hand, hurtful and useless. Did you never observe the narrow intelligence flashing from the keen eye of a clever rogue -- how eager he is, how clearly his paltry soul sees the way to his end; he is the reverse of blind, but his keen eyesight is forced into the service of evil, and he is mischievous in proportion to his cleverness?

Very true, he said.

But what if there had been a circumcision of such natures in the days of their youth; and they had been severed from those sensual pleasures, such as eating and drinking, which, like leaden weights, were attached to them at their birth, and which drag them down and turn the vision of their souls upon the things that are below -- if, I say, they had been released from these impediments and turned in the opposite direction, the very same faculty in them would have seen the truth as keenly as they see what their eyes are turned to now.

Very likely.

Yes, I said; and there is another thing which is likely, or rather a necessary inference from what has preceded, that neither the uneducated and uninformed of the truth, nor yet those who never make an end of their education, will be able ministers of the State; not the former, because they have no single aim of duty which is the rule of all their actions, private as well as public; nor the latter, because they will not act at all except upon compulsion, fancying that they are already dwelling apart in the islands of the blessed.

Very true, he replied.

Then, I said, the business of us who are the founders of the State will be to compel the best minds to attain that knowledge which we have already shown to be the greatest of all -- they must continue to ascend until they arrive at the good; but when they have ascended and seen enough we must not allow them to do as they do now.

What do you mean?

I mean that they remain in the upper world: but this must not be allowed; they must be made to descend again among the prisoners in the den, and partake of their labors

and honors, whether they are worth having or not.

But is not this unjust? he said; ought we to give them a worse life, when they might have a better?

You have again forgotten, my friend, I said, the intention of the legislator, who did not aim at making any one class in the State happy above the rest; the happiness was to be in the whole State, and he held the citizens together by persuasion and necessity, making them benefactors of the State, and therefore benefactors of one another; to this end he created them, not to please themselves, but to be his instruments in binding up the State.

True, he said, I had forgotten.

Observe, Glaucon, that there will be no injustice in compelling our philosophers to have a care and providence of others; we shall explain to them that in other States, men of their class are not obliged to share in the toils of politics: and this is reasonable, for they grow up at their own sweet will, and the government would rather not have them. Being selftaught, they cannot be expected to show any gratitude for a culture which they have never received. But we have brought you into the world to be rulers of the hive, kings of yourselves and of the other citizens, and have educated you far better and more perfectly than they have been educated, and you are better able to share in the double duty. Wherefore each of you, when his turn comes, must go down to the general underground abode, and get the habit of seeing in the dark. When you have acquired the habit, you will see ten thousand times better than the inhabitants of the den, and you will know what the several images are, and what they represent, because you have seen the beautiful and just and good in their truth. And thus our State, which is also yours, will be a reality, and not a dream only, and will be administered in a spirit unlike that of other States, in which men fight with one another about shadows only and are distracted in the struggle for power, which in their eyes is a great good. Whereas the truth is that the State in which the rulers are most reluctant to govern is always the best and most quietly governed, and the State in which they are most eager, the worst.

Quite true, he replied.

And will our pupils, when they hear this, refuse to take their turn at the toils of State, when they are allowed to spend the greater part of their time with one another in the heavenly light?

Impossible, he answered; for they are just men, and the commands which we impose upon them are just; there can be no doubt that every one of them will take office as a stern necessity, and not after the fashion of our present rulers of State.

Yes, my friend, I said; and there lies the point. You must contrive for your future rulers another and a better life than that of a ruler, and then you may have a

wellordered State; for only in the State which offers this, will they rule who are truly rich, not in silver and gold, but in virtue and wisdom, which are the true blessings of life. Whereas, if they go to the administration of public affairs, poor and hungering after their own private advantage, thinking that hence they are to snatch the chief good, order there can never be; for they will be fighting about office, and the civil and domestic broils which thus arise will be the ruin of the rulers themselves and of the whole State.

Most true, he replied.

And the only life which looks down upon the life of political ambition is that of true philosophy. Do you know of any other?

Indeed, I do not, he said.

And those who govern ought not to be lovers of the task? For, if they are, there will be rival lovers, and they will fight.

No question. Who, then, are those whom we shall compel to be guardians? Surely they will be the men who are wisest about affairs of State, and by whom the State is best administered, and who at the same time have other honors and another and a better life than that of politics?

They are the men, and I will choose them, he replied.

And now shall we consider in what way such guardians will be produced, and how they are to be brought from darkness to light -- as some are said to have ascended from the world below to the gods?

By all means, he replied.

The process, I said, is not the turning over of an oystershell, but the turning round of a soul passing from a day which is little better than night to the true day of being, that is, the ascent from below, which we affirm to be true philosophy?

Quite so.

And should we not inquire what sort of knowledge has the power of effecting such a change?

Certainly.

What sort of knowledge is there which would draw the soul from becoming to being? And another consideration has just occurred to me: You will remember that our young men are to be warrior athletes?

Yes, that was said.

Then this new kind of knowledge must have an additional quality?

What quality?

Usefulness in war.

Yes, if possible.

There were two parts in our former scheme of education, were there not?

Just so.

There was gymnastics, which presided over the growth and decay of the body, and may therefore be regarded as having to do with generation and corruption?

True.

Then that is not the knowledge which we are seeking to discover? No.

But what do you say of music, what also entered to a certain extent into our former scheme?

Music, he said, as you will remember, was the counterpart of gymnastics, and trained the guardians by the influences of habit, by harmony making them harmonious, by rhythm rhythmical, but not giving them science; and the words, whether fabulous or possibly true, had kindred elements of rhythm and harmony in them. But in music there was nothing which tended to that good which you are now seeking.

You are most accurate, I said, in your recollection; in music there certainly was nothing of the kind. But what branch of knowledge is there, my dear Glaucon, which is of the desired nature; since all the useful arts were reckoned mean by us?

Undoubtedly; and yet if music and gymnastics are excluded, and the arts are also excluded, what remains?

Well, I said, there may be nothing left of our special subjects; and then we shall have to take something which is not special, but of the universal application.

What may that be?

A something which all arts and sciences and intelligences use in common, and which everyone first has to learn among the elements of education.

What is that?

The little matter of distinguishing one, two, and three -- in a word, number and calculation: do not all arts and sciences necessarily partake of them?

Yes.

Then the art of war partakes of them?

To be sure.

Then Palamedes, whenever he appears in tragedy, proves Agamemnon ridiculously unfit to be a general. Did you never remark how he declares that he had invented number, and had numbered the ships and set in array the ranks of the army at Troy; which implies that they had never been numbered before, and Agamemnon must be supposed literally to have been incapable of counting his own fleet -- how could he if he was ignorant of number? And if that is true, what sort of general must he have been?

I should say a very strange one, if this was as you say.

Can we deny that a warrior should have a knowledge of arithmetic?

Certainly he should, if he is to have the smallest understanding of military tactics, or indeed, I should rather say, if he is to be a man at all.

I should like to know whether you have the same notion which I have of this study?

What is your notion?

It appears to me to be a study of the kind which we are seeking, and which leads naturally to reflection, but never to have been rightly used; for the true use of it is simply to draw the soul toward being.

Will you explain your meaning? he said.

I will try, I said; and I wish you would share the inquiry with me, and say "yes" or "no" when I attempt to distinguish in my own mind what branches of knowledge have this attracting power, in order that we may have clearer proof that arithmetic is, as I suspect, one of them.

Explain, he said.

I mean to say that objects of sense are of two kinds; some of them do not invite thought because the sense is an adequate judge of them; while in the case of other objects sense is so untrustworthy that further inquiry is imperatively demanded.

You are clearly referring, he said, to the manner in which the senses are imposed upon by distance, and by painting in light and shade.

No, I said, that is not at all my meaning.

Then what is your meaning?

When speaking of uninviting objects, I mean those which do not pass from one sensation to the opposite; inviting objects are those which do; in this latter case the sense coming upon the object, whether at a distance or near, gives no more vivid idea of anything in particular than of its

opposite. An illustration will make my meaning clearer: here are three fingers -- a little finger, a second finger, and a middle finger.

Very good.

You may suppose that they are seen quite close: And here comes the point.

What is it?

Each of them equally appears a finger, whether seen in the middle or at the extremity, whether white or black, or thick or thin -- it makes no difference; a finger is a finger all the same. In these cases a man is not compelled to ask of thought the question, What is a finger? for the sight never intimates to the mind that a finger is other than a finger.

True.

And therefore, I said, as we might expect, there is nothing here which invites or excites intelligence.

There is not, he said.

But is this equally true of the greatness and smallness of the fingers? Can sight adequately perceive them? and is no difference made by the circumstance that one of the fingers is in the middle and the other at the extremity? And in like manner does the touch adequately perceive the qualities of thickness or thinness, of softness or hardness? And so of the other senses; do they give perfect intimations of such matters? Is not their mode of operation on this wise -- the sense which is concerned with the quality of hardness is necessarily concerned also with the quality of softness, and only intimates to the soul that the same thing is felt to be both hard and soft?

You are quite right, he said.

And must not the soul be perplexed at this intimation which the sense gives of a hard which is also soft? What, again, is the meaning of light and heavy, if that which is light is also heavy, and that which is heavy, light?

Yes, he said, these intimations which the soul receives are very curious and require to be explained.

Yes, I said, and in these perplexities the soul naturally summons to her aid calculation and intelligence, that she may see whether the several objects announced to her are one or two.

True.

And if they turn out to be two, is not each of them one and different?

Certainly.

And if each is one, and both are two, she will conceive the two as in a state of division, for if they were undivided they could only be conceived of as one?

True.

The eye certainly did see both small and great, but only in a confused manner; they were not distinguished.

Yes.

Whereas the thinking mind, intending to light up the chaos, was compelled to reverse the process, and look at small and great as separate and not confused.

Very true.

Was not this the beginning of the inquiry, "What is great?" and "What is small?"

Exactly so.

And thus arose the distinction of the visible and the intelligible.

Most true.

This was what I meant when I spoke of impressions which invited the intellect, or the reverse -- those which are simultaneous with opposite impressions, invite thought; those which are not simultaneous do not.

I understand, he said, and agree with you.

And to which class do unity and number belong?

I do not know, he replied.

Think a little and you will see that what has preceded will supply the answer; for if simple unity could be adequately perceived by the sight or by any other sense, then, as we were saying in the case of the finger, there would be nothing to attract toward being; but when there is some contradiction always present, and one is the reverse of one and involves the conception of plurality, then thought begins to be aroused within us, and the soul perplexed and wanting to arrive at a decision asks, "What is absolute unity?" This is the way in which the study of the one has a power of drawing and converting the mind to the contemplation of true being.

And surely, he said, this occurs notably in the case of one; for we see the same thing to be both one and infinite in multitude?

Yes, I said; and this being true of one must be equally true of all number?

Certainly.

And all arithmetic and calculation have to do with

number?

Yes.

And they appear to lead the mind toward truth?

Yes, in a very remarkable manner.

Then this is knowledge of the kind for which we are seeking, having a double use, military and philosophical; for the man of war must learn the art of number or he will not know how to array his troops, and the philosopher also, because he has to rise out of the sea of change and lay hold of true being, and therefore he must be an arithmetician.

That is true.

And our guardian is both warrior and philosopher?

Certainly.

Then this is a kind of knowledge which legislation may fitly prescribe; and we must endeavor to persuade those who are to be the principal men of our State to go and learn arithmetic, not as amateurs, but they must carry on the study until they see the nature of numbers with the mind only; nor again, like merchants or retailtraders, with a view to buying or selling, but for the sake of their military use, and of the soul herself; and because this will be the easiest way for her to pass from becoming to truth and being.

That is excellent, he said.

Yes, I said, and now having spoken of it, I must add how charming the science is! and in how many ways it conduces to our desired end, if pursued in the spirit of a philosopher, and not of a shopkeeper!

How do you mean?

I mean, as I was saying, that arithmetic has a very great and elevating effect, compelling the soul to reason about abstract number, and rebelling against the introduction of visible or tangible objects into the argument. You know how steadily the masters of the art repel and ridicule anyone who attempts to divide absolute unity when he is calculating, and if you divide, they multiply, taking care that one shall continue one and not become lost in fractions.

That is very true.

Now, suppose a person were to say to them: O my friends, what are these wonderful numbers about which you are reasoning, in which, as you say, there is a unity such as you demand, and each unit is equal, invariable, indivisible -- what would they answer?

They would answer, as I should conceive, that they were speaking of those numbers which can only be realized in

thought.

Then you see that this knowledge may be truly called necessary, necessitating as it clearly does the use of the pure intelligence in the attainment of pure truth?

Yes; that is a marked characteristic of it.

And have you further observed that those who have a natural talent for calculation are generally quick at every other kind of knowledge; and even the dull, if they have had an arithmetical training, although they may derive no other advantage from it, always become much quicker than they would otherwise have been?

Very true, he said.

And indeed, you will not easily find a more difficult study, and not many as difficult.

You will not.

And, for all these reasons, arithmetic is a kind of knowledge in which the best natures should be trained, and which must not be given up.

I agree.

Let this then be made one of our subjects of education. And next, shall we inquire whether the kindred science also concerns us?

You mean geometry?

Exactly so.

Clearly, he said, we are concerned with that part of geometry which relates to war; for in pitching a camp or taking up a position or closing or extending the lines of an army, or any other military manoeuvre, whether in actual battle or on a march, it will make all the difference whether a general is or is not a geometrician.

Yes, I said, but for that purpose a very little of either geometry or calculation will be enough; the question relates rather to the greater and more advanced part of geometry -- whether that tends in any degree to make more easy the vision of the idea of good; and thither, as I was saying, all things tend which compel the soul to turn her gaze toward that place, where is the full perfection of being, which she ought, by all means, to behold.

True, he said.

Then if geometry compels us to view being, it concerns us; if becoming only, it does not concern us?

Yes, that is what we assert.

Yet anybody who has the least acquaintance with geometry will not deny that such a conception of the science

is in flat contradiction to the ordinary language of geometricians.

How so?

They have in view practice only, and are always speaking, in a narrow and ridiculous manner, of squaring and extending and applying and the like -- they confuse the necessities of geometry with those of daily life; whereas knowledge is the real object of the whole science.

Certainly, he said.

Then must not a further admission be made?

What admission?

That the knowledge at which geometry aims is knowledge of the eternal, and not of aught perishing and transient.

That, he replied, may be readily allowed, and is true.

Then, my noble friend, geometry will draw the soul toward truth, and create the spirit of philosophy, and raise up that which is now unhappily allowed to fall down.

Nothing will be more likely to have such an effect.

Then nothing should be more sternly laid down than that the inhabitants of your fair city should by all means learn geometry. Moreover, the science has indirect effects, which are not small.

Of what kind? he said.

There are the military advantages of which you spoke, I said; and in all departments of knowledge, as experience proves, anyone who has studied geometry is infinitely quicker of apprehension than one who has not. Yes, indeed, he said, there is an infinite difference between them.

Then shall we propose this as a second branch of knowledge which our youth will study?

Let us do so, he replied.

And suppose we make astronomy the third -- what do you say?

I am strongly inclined to it, he said; the observation of the seasons and of months and years is as essential to the general as it is to the farmer or sailor.

I am amused, I said, at your fear of the world, which makes you guard against the appearance of insisting upon useless studies; and I quite admit the difficulty of believing that in every man there is an eye of the soul which, when by other pursuits lost and dimmed, is by these purified and reillumined; and is more precious far than ten thousand bodily eyes, for by it alone is truth seen. Now there are two classes of persons: one class of those who

will agree with you and will take your words as a revelation; another class to whom they will be utterly unmeaning, and who will naturally deem them to be idle tales, for they see no sort of profit which is to be obtained from them. And therefore you had better decide at once with which of the two you are proposing to argue. You will very likely say with neither, and that your chief aim in carrying on the argument is your own improvement; at the same time you do not grudge to others any benefit which they may receive.

I think that I should prefer to carry on the argument mainly on my own behalf.

Then take a step backward, for we have gone wrong in the order of the sciences.

What was the mistake? he said.

After plane geometry, I said, we proceeded at once to solids in revolution, instead of taking solids in themselves; whereas after the second dimension, the third, which is concerned with cubes and dimensions of depth, ought to have followed.

That is true, Socrates; but so little seems to be known as yet about these subjects.

Why, yes, I said, and for two reasons: in the first place, no government patronizes them; this leads to a want of energy in the pursuit of them, and they are difficult; in the second place, students cannot learn them unless they have a director. But then a director can hardly be found, and, even if he could, as matters now stand, the students, who are very conceited, would not attend to him. That, however, would be otherwise if the whole State became the director of these studies and gave honor to them; then disciples would want to come, and there would be continuous and earnest search, and discoveries would be made; since even now, disregarded as they are by the world, and maimed of their fair proportions, and although none of their votaries can tell the use of them, still these studies force their way by their natural charm, and very likely, if they had the help of the State, they would some day emerge into light.

Yes, he said, there is a remarkable charm in them. But I do not clearly understand the change in the order. First you began with a geometry of plane surfaces?

Yes, I said.

And you placed astronomy next, and then you made a step backward?

Yes, and I have delayed you by my hurry; the ludicrous state of solid geometry, which, in natural order, should have followed, made me pass over this branch and go on to astronomy, or motion of solids.

True, he said.

Then assuming that the science now omitted would come into existence if encouraged by the State, let us go on to astronomy, which will be fourth.

The right order, he replied. And now, Socrates, as you rebuked the vulgar manner in which I praised astronomy before, my praise shall be given in your own spirit. For everyone, as I think, must see that astronomy compels the soul to look upward and leads us from this world to another. Everyone but myself, I said; to everyone else this may be clear, but not to me.

And what, then, would you say?

I should rather say that those who elevate astronomy into philosophy appear to me to make us look downward, and not upward.

What do you mean? he asked.

You, I replied, have in your mind a truly sublime conception of our knowledge of the things above. And I dare say that if a person were to throw his head back and study the fretted ceiling, you would still think that his mind was the percipient, and not his eyes. And you are very likely right, and I may be a simpleton: but, in my opinion, that knowledge only which is of being and of the unseen can make the soul look upward, and whether a man gapes at the heavens or blinks on the ground, seeking to learn some particular of sense, I would deny that he can learn, for nothing of that sort is matter of science; his soul is looking downward, not upward, whether his way to knowledge is by water or by land, whether he floats or only lies on his back.

I acknowledge, he said, the justice of your rebuke. Still, I should like to ascertain how astronomy can be learned in any manner more conducive to that knowledge of which we are speaking?

I will tell you, I said: The starry heaven which we behold is wrought upon a visible ground, and therefore, although the fairest and most perfect of visible things, must necessarily be deemed inferior far to the true motions of absolute swiftness and absolute slowness, which are relative to each other, and carry with them that which is contained in them, in the true number and in every true figure. Now, these are to be apprehended by reason and intelligence, but not by sight.

True, he replied.

The spangled heavens should be used as a pattern and with a view to that higher knowledge; their beauty is like the beauty of figures or pictures excellently wrought by the hand of Daedalus, or some other great artist, which we may chance to behold; any geometrician who saw them would appreciate the exquisiteness of their workmanship, but he would never dream of thinking that in them he could find the true equal or the true double, or the truth of any other proportion.

No, he replied, such an idea would be ridiculous.

And will not a true astronomer have the same feeling when he looks at the movements of the stars? Will he not think that heaven and the things in heaven are framed by the Creator of them in the most perfect manner? But he will never imagine that the proportions of night and day, or of both to the month, or of the month to the year, or of the stars to these and to one another, and any other things that are material and visible can also be eternal and subject to no deviation -- that would be absurd; and it is equally absurd to take so much pains in investigating their exact truth.

I quite agree, though I never thought of this before.

Then, I said, in astronomy, as in geometry, we should employ problems, and let the heavens alone if we would approach the subject in the right way and so make the natural gift of reason to be of any real use.

That, he said, is a work infinitely beyond our present astronomers.

Yes, I said; and there are many other things which must also have a similar extension given to them, if our legislation is to be of any value. But can you tell me of any other suitable study?

No, he said, not without thinking.

Motion, I said, has many forms, and not one only; two of them are obvious enough even to wits no better than ours; and there are others, as I imagine, which may be left to wiser persons.

But where are the two?

There is a second, I said, which is the counterpart of the one already named.

And what may that be?

The second, I said, would seem relatively to the ears to be what the first is to the eyes; for I conceive that as the eyes are designed to look up at the stars, so are the ears to hear harmonious motions; and these are sister sciences -- as the Pythagoreans say, and we, Glaucon, agree with them?

Yes, he replied.

But this, I said, is a laborious study, and therefore we had better go and learn of them; and they will tell us whether there are any other applications of these sciences. At the same time, we must not lose sight of our own higher object.

What is that?

There is a perfection which all knowledge ought to reach, and which our pupils ought also to attain, and not to fall short of, as I was saying that they did in astronomy. For in the science of harmony, as you probably know, the same thing happens. The teachers of harmony compare the sounds and consonances which are heard only, and their labor, like that of the astronomers, is in vain.

Yes, by heaven! he said; and 'tis as good as a play to hear them talking about their condensed notes, as they call them; they put their ears close alongside of the strings like persons catching a sound from their neighbor's wall -- one set of them declaring that they distinguish an intermediate note and have found the least interval which should be the unit of measurement; the others insisting that the two sounds have passed into the same -- either party setting their ears before their understanding.

You mean, I said, those gentlemen who tease and torture the strings and rack them on the pegs of the instrument: I might carry on the metaphor and speak after their manner of the blows which the plectrum gives, and make accusations against the strings, both of backwardness and forwardness to sound; but this would be tedious, and therefore I will only say that these are not the men, and that I am referring to the Pythagoreans, of whom I was just now proposing to inquire about harmony. For they too are in error, like the astronomers; they investigate the numbers of the harmonies which are heard, but they never attain to problems -- that is to say, they never reach the natural harmonies of number, or reflect why some numbers are harmonious and others not.

That, he said, is a thing of more than mortal knowledge.

A thing, I replied, which I would rather call useful; that is, if sought after with a view to the beautiful and good; but if pursued in any other spirit, useless. Very true, he said.

Now, when all these studies reach the point of intercommunion and connection with one another, and come to be considered in their mutual affinities, then, I think, but not till then, will the pursuit of them have a value for our objects; otherwise there is no profit in them.

I suspect so; but you are speaking, Socrates, of a vast work.

What do you mean? I said; the prelude, or what? Do you not know that all this is but the prelude to the actual strain which we have to learn? For you surely would not regard the skilled mathematician as a dialectician?

Assuredly not, he said; I have hardly ever known a mathematician who was capable of reasoning.

But do you imagine that men who are unable to give and take a reason will have the knowledge which we require of them?

Neither can this be supposed.

And so, Glaucon, I said, we have at last arrived at the hymn of dialectic. This is that strain which is of the intellect only, but which the faculty of sight will nevertheless be found to imitate; for sight, as you may remember, was imagined by us after a while to behold the real animals and stars, and last of all the sun himself. And so with dialectic; when a person starts on the discovery of the absolute by the light of reason only, and without any assistance of sense, and perseveres until by pure intelligence he arrives at the perception of the absolute good, he at last finds himself at the end of the intellectual world, as in the case of sight at the end of the visible.

Exactly, he said.

Then this is the progress which you call dialectic?

True.

But the release of the prisoners from chains, and their translation from the shadows to the images and to the light, and the ascent from the underground den to the sun, while in his presence they are vainly trying to look on animals and plants and the light of the sun, but are able to perceive even with their weak eyes the images in the water (which are divine), and are the shadows of true existence (not shadows of images cast by a light of fire, which compared with the sun is only an image) -- this power of elevating the highest principle in the soul to the contemplation of that which is best in existence, with which we may compare the raising of that faculty which is the very light of the body to the sight of that which is brightest in the material and visible world -- this power is given, as I was saying, by all that study and pursuit of the arts which have been described.

I agree in what you are saying, he replied, which may be hard to believe, yet, from another point of view, is harder still to deny. This, however, is not a theme to be treated of in passing only, but will have to be discussed again and again. And so, whether our conclusion be true or false, let us assume all this, and proceed at once from the prelude or preamble to the chief strain, and describe that in like manner. Say, then, what is the nature and what are the divisions of dialectic, and what are the paths which lead thither; for these paths will also lead to our final rest.

Dear Glaucon, I said, you will not be able to follow me here, though I would do my best, and you should behold not an image only, but the absolute truth, according to my notion. Whether what I told you would or would not have been a reality I cannot venture to say; but you would have seen something like reality; of that I am confident.

Doubtless, he replied.

But I must also remind you that the power of dialectic alone can reveal this, and only to one who is a disciple of

the previous sciences.

Of that assertion you may be as confident as of the last.

And assuredly no one will argue that there is any other method of comprehending by any regular process all true existence, or of ascertaining what each thing is in its own nature; for the arts in general are concerned with the desires or opinions of men, or are cultivated with a view to production and construction, or for the preservation of such productions and constructions; and as to the mathematical sciences which, as we were saying, have some apprehension of true being -- geometry and the like -- they only dream about being, but never can they behold the waking reality so long as they leave the hypotheses which they use unexamined, and are unable to give an account of them. For when a man knows not his own first principle, and when the conclusion and intermediate steps are also constructed out of he knows not what, how can he imagine that such a fabric of convention can ever become science?

Impossible, he said.

Then dialectic, and dialectic alone, goes directly to the first principle and is the only science which does away with hypotheses in order to make her ground secure; the eye of the soul, which is literally buried in an outlandish slough, is by her gentle aid lifted upward; and she uses as handmaids and helpers in the work of conversion, the sciences which we have been discussing. Custom terms them sciences, but they ought to have some other name, implying greater clearness than opinion and less clearness than science: and this, in our previous sketch, was called understanding. But why should we dispute about names when we have realities of such importance to consider? Why, indeed, he said, when any name will do which expresses the thought of the mind with clearness?

At any rate, we are satisfied, as before, to have four divisions; two for intellect and two for opinion, and to call the first division science, the second understanding, the third belief, and the fourth perception of shadows, opinion being concerned with becoming, and intellect with being; and so to make a proportion:

"As being is to becoming, so is pure intellect to opinion. And as intellect is to opinion, so is science to belief, and understanding to the perception of shadows."

But let us defer the further correlation and subdivision of the subjects of opinion and of intellect, for it will be a long inquiry, many times longer than this has been.

As far as I understand, he said, I agree.

And do you also agree, I said, in describing the dialectician as one who attains a conception of the essence of each thing? And he who does not possess and is therefore unable to impart this conception, in whatever degree he

fails, may in that degree also be said to fail in intelligence? Will you admit so much?

Yes, he said; how can I deny it?

And you would say the same of the conception of the good?

Until the person is able to abstract and define rationally the idea of good, and unless he can run the gauntlet of all objections, and is ready to disprove them, not by appeals to opinion, but to absolute truth, never faltering at any step of the argument -- unless he can do all this, you would say that he knows neither the idea of good nor any other good; he apprehends only a shadow, if anything at all, which is given by opinion, and not by science; dreaming and slumbering in this life, before he is well awake here, he arrives at the world below, and has his final quietus.

In all that I should most certainly agree with you.

And surely you would not have the children of your ideal State, whom you are nurturing and educating -- if the ideal ever becomes a reality -- you would not allow the future rulers to be like posts, having no reason in them, and yet to be set in authority over the highest matters?

Certainly not.

Then you will make a law that they shall have such an education as will enable them to attain the greatest skill in asking and answering questions?

Yes, he said, you and I together will make it.

Dialectic, then, as you will agree, is the copingstone of the sciences, and is set over them; no other science can be placed higher -- the nature of knowledge can no further go?

I agree, he said.

But to whom we are to assign these studies, and in what way they are to be assigned, are questions which remain to be considered.

Yes, clearly.

You remember, I said, how the rulers were chosen before?

Certainly, he said.

The same natures must still be chosen, and the preference again given to the surest and the bravest, and, if possible, to the fairest; and, having noble and generous tempers, they should also have the natural gifts which will facilitate their education.

And what are these?

Such gifts as keenness and ready powers of acquisition; for the mind more often faints from the severity of study than from the severity of gymnastics: the toil is more entirely the mind's own, and is not shared with the body.

Very true, he replied.

Further, he of whom we are in search should have a good memory, and be an unwearied solid man who is a lover of labor in any line; or he will never be able to endure the great amount of bodily exercise and to go through all the intellectual discipline and study which we require of him.

Certainly, he said; he must have natural gifts.

The mistake at present is that those who study philosophy have no vocation, and this, as I was before saying, is the reason why she has fallen into disrepute: her true sons should take her by the hand, and not bastards.

What do you mean?

In the first place, her votary should not have a lame or halting industry -- I mean, that he should not be half industrious and half idle: as, for example, when a man is a lover of gymnastics and hunting, and all other bodily exercises, but a hater rather than a lover of the labor of learning or listening or inquiring. Or the occupation to which he devotes himself may be of an opposite kind, and he may have the other sort of lameness.

Certainly, he said.

And as to truth, I said, is not a soul equally to be deemed halt and lame which hates voluntary falsehood and is extremely indignant at herself and others when they tell lies, but is patient of involuntary falsehood, and does not mind wallowing like a swinish beast in the mire of ignorance, and has no shame at being detected?

To be sure.

And, again, in respect of temperance, courage, magnificence, and every other virtue, should we not carefully distinguish between the true son and the bastard? for where there is no discernment of such qualities, States and individuals unconsciously err; and the State makes a ruler, and the individual a friend, of one who, being defective in some part of virtue, is in a figure lame or a bastard.

That is very true, he said.

All these things, then, will have to be carefully considered by us; and if only those whom we introduce to this vast system of education and training are sound in body and mind, justice herself will have nothing to say against us, and we shall be the saviours of the constitution and of the State; but, if our pupils are men of another stamp, the reverse will happen, and we shall pour a still greater flood

of ridicule on philosophy than she has to endure at present.

That would not be creditable.

Certainly not, I said; and yet perhaps, in thus turning jest into earnest I am equally ridiculous.

In what respect?

I had forgotten, I said, that we were not serious, and spoke with too much excitement. For when I saw philosophy so undeservedly trampled under foot of men I could not help feeling a sort of indignation at the authors of her disgrace: and my anger made me too vehement.

Indeed! I was listening, and did not think so.

But I, who am the speaker, felt that I was. And now let me remind you that, although in our former selection we chose old men, we must not do so in this. Solon was under a delusion when he said that a man when he grows old may learn many things -- for he can no more learn much than he can run much; youth is the time for any extraordinary toil.

Of course.

And, therefore, calculation and geometry and all the other elements of instruction, which are a preparation for dialectic, should be presented to the mind in childhood; not, however, under any notion of forcing our system of education.

Why not?

Because a freeman ought not to be a slave in the acquisition of knowledge of any kind. Bodily exercise, when compulsory, does no harm to the body; but knowledge which is acquired under compulsion obtains no hold on the mind.

Very true.

Then, my good friend, I said, do not use compulsion, but let early education be a sort of amusement; you will then be better able to find out the natural bent.

That is a very rational notion, he said.

Do you remember that the children, too, were to be taken to see the battle on horseback; and that if there were no danger they were to be brought close up and, like young hounds, have a taste of blood given them?

Yes, I remember.

The same practice may be followed, I said, in all these things -- labors, lessons, dangers -- and he who is most at home in all of them ought to be enrolled in a select number.

At what age?

At the age when the necessary gymnastics are over: the

period, whether of two or three years, which passes in this sort of training is useless for any other purpose; for sleep and exercise are unpropitious to learning; and the trial of who is first in gymnastic exercises is one of the most important tests to which our youth are subjected.

Certainly, he replied.

After that time those who are selected from the class of twenty years old will be promoted to higher honor, and the sciences which they learned without any order in their early education will now be brought together, and they will be able to see the natural relationship of them to one another and to true being.

Yes, he said, that is the only kind of knowledge which takes lasting root.

Yes, I said; and the capacity for such knowledge is the great criterion of dialectical talent: the comprehensive mind is always the dialectical.

I agree with you, he said.

These, I said, are the points which you must consider; and those who have most of this comprehension, and who are most steadfast in their learning, and in their military and other appointed duties, when they have arrived at the age of thirty will have to be chosen by you out of the select class, and elevated to higher honor; and you will have to prove them by the help of dialectic, in order to learn which of them is able to give up the use of sight and the other senses, and in company with truth to attain absolute being: And here, my friend, great caution is required.

Why great caution?

Do you not remark, I said, how great is the evil which dialectic has introduced?

What evil? he said.

The students of the art are filled with lawlessness.

Quite true, he said.

Do you think that there is anything so very unnatural or inexcusable in their case? or will you make allowance for them?

In what way make allowance?

I want you, I said, by way of parallel, to imagine a supposititious son who is brought up in great wealth; he is one of a great and numerous family, and has many flatterers. When he grows up to manhood, he learns that his alleged are not his real parents; but who the real are he is unable to discover. Can you guess how he will be likely to behave toward his flatterers and his supposed parents, first of all during the period when he is ignorant of the false relation, and then again when he knows? Or shall I guess for you?

If you please.

Then I should say that while he is ignorant of the truth he will be likely to honor his father and his mother and his supposed relations more than the flatterers; he will be less inclined to neglect them when in need, or to do or say anything against them; and he will be less willing to disobey them in any important matter.

He will.

But when he has made the discovery, I should imagine that he would diminish his honor and regard for them, and would become more devoted to the flatterers; their influence over him would greatly increase; he would now live after their ways, and openly associate with them, and, unless he were of an unusually good disposition, he would trouble himself no more about his supposed parents or other relations.

Well, all that is very probable. But how is the image applicable to the disciples of philosophy?

In this way: you know that there are certain principles about justice and honor, which were taught us in childhood, and under their parental authority we have been brought up, obeying and honoring them.

That is true.

There are also opposite maxims and habits of pleasure which flatter and attract the soul, but do not influence those of us who have any sense of right, and they continue to obey and honor the maxims of their fathers.

True.

Now, when a man is in this state, and the questioning spirit asks what is fair or honorable, and he answers as the legislator has taught him, and then arguments many and diverse refute his words, until he is driven into believing that nothing is honorable any more than dishonorable, or just and good any more than the reverse, and so of all the notions which he most valued, do you think that he will still honor and obey them as before?

Impossible.

And when he ceases to think them honorable and natural as heretofore, and he fails to discover the true, can he be expected to pursue any life other than that which flatters his desires?

He cannot.

And from being a keeper of the law he is converted into a breaker of it?

Unquestionably.

Now all this is very natural in students of philosophy such as I have described, and also, as I was just now saying, most excusable.

Yes, he said; and, I may add, pitiable.

Therefore, that your feelings may not be moved to pity about our citizens who are now thirty years of age, every care must be taken in introducing them to dialectic.

Certainly.

There is a danger lest they should taste the dear delight too early; for youngsters, as you may have observed, when they first get the taste in their mouths, argue for amusement, and are always contradicting and refuting others in imitation of those who refute them; like puppydogs, they rejoice in pulling and tearing at all who come near them.

Yes, he said, there is nothing which they like better.

And when they have made many conquests and received defeats at the hands of many, they violently and speedily get into a way of not believing anything which they believed before, and hence, not only they, but philosophy and all that relates to it is apt to have a bad name with the rest of the world.

Too true, he said.

But when a man begins to get older, he will no longer be guilty of such insanity; he will imitate the dialectician who is seeking for truth, and not the eristic, who is contradicting for the sake of amusement; and the greater moderation of his character will increase instead of diminishing the honor of the pursuit.

Very true, he said.

And did we not make special provision for this, when we said that the disciples of philosophy were to be orderly and steadfast, not, as now, any chance aspirant or intruder?

Very true.

Suppose, I said, the study of philosophy to take the place of gymnastics and to be continued diligently and earnestly and exclusively for twice the number of years which were passed in bodily exercise -- will that be enough?

Would you say six or four years? he asked.

Say five years, I replied; at the end of the time they must be sent down again into the den and compelled to hold any military or other office which young men are qualified to hold: in this way they will get their experience of life, and there will be an opportunity of trying whether, when they are drawn all manner of ways by temptation, they will stand firm or flinch.

And how long is this stage of their lives to last?

Fifteen years, I answered; and when they have reached fifty years of age, then let those who still survive and have distinguished themselves in every action of their lives, and in every branch of knowledge, come at last to their consummation: the time has now arrived at which they must raise the eye of the soul to the universal light which lightens all things, and behold the absolute good; for that is the pattern according to which they are to order the State and the lives of individuals, and the remainder of their own lives also; making philosophy their chief pursuit, but, when their turn comes, toiling also at politics and ruling for the public good, not as though they were performing some heroic action, but simply as a matter of duty; and when they have brought up in each generation others like themselves and left them in their place to be governors of the State, then they will depart to the Islands of the Blessed and dwell there; and the city will give them public memorials and sacrifices and honor them, if the Pythian oracle consent, as demigods, but if not, as in any case blessed and divine.

You are a sculptor, Socrates, and have made statues of our governors faultless in beauty.

Yes, I said, Glaucon, and of our governesses too; for you must not suppose that what I have been saying applies to men only and not to women as far as their natures can go.

There you are right, he said, since we have made them to share in all things like the men.

Well, I said, and you would agree (would you not?) that what has been said about the State and the government is not a mere dream, and although difficult, not impossible, but only possible in the way which has been supposed; that is to say, when the true philosopherkings are born in a State, one or more of them, despising the honors of this present world which they deem mean and worthless, esteeming above all things right and the honor that springs from right, and regarding justice as the greatest and most necessary of all things, whose ministers they are, and whose principles will be exalted by them when they set in order their own city?

How will they proceed?

They will begin by sending out into the country all the inhabitants of the city who are more than ten years old, and will take possession of their children, who will be unaffected by the habits of their parents; these they will train in their own habits and laws, I mean in the laws which we have given them: and in this way the State and constitution of which we were speaking will soonest and most easily attain happiness, and the nation which has such a constitution will gain most.

Yes, that will be the best way. And I think, Socrates, that you have very well described how, if ever, such a constitution might come into being. Enough, then, of the perfect State, and of the man who bears its image -- there is no difficulty in seeing how we shall describe him.

There is no difficulty, he replied; and I agree with you in thinking that nothing more need be said.

* * * *

Book VIII: Four Forms Of Government

(Socrates, Glaucon.)

AND so, Glaucon, we have arrived at the conclusion that in the perfect State wives and children are to be in common; and that all education and the pursuits of war and peace are also to be common, and the best philosophers and the bravest warriors are to be their kings?

That, replied Glaucon, has been acknowledged.

Yes, I said; and we have further acknowledged that the governors, when appointed themselves, will take their soldiers and place them in houses such as we were describing, which are common to all, and contain nothing private, or individual; and about their property, you remember what we agreed?

Yes, I remember that no one was to have any of the ordinary possessions of mankind; they were to be warrior athletes and guardians, receiving from the other citizens, in lieu of annual payment, only their maintenance, and they were to take care of themselves and of the whole State.

True, I said; and now that this division of our task is concluded, let us find the point at which we digressed, that we may return into the old path.

There is no difficulty in returning; you implied, then as now, that you had finished the description of the State: you said that such a State was good, and that the man was good who answered to it, although, as now appears, you had more excellent things to relate both of State and man. And you said further, that if this was the true form, then the others were false; and of the false forms, you said, as I remember, that there were four principal ones, and that their defects, and the defects of the individuals corresponding to them, were worth examining. When we had seen all the individuals, and finally agreed as to who was the best and who was the worst of them, we were to consider whether the best was not also the happiest, and the worst the most miserable. I asked you what were the four forms of government of which you spoke, and then Polemarchus and Adeimantus put in their word; and you began again, and have found your way to the point at which we have now arrived.

Your recollection, I said, is most exact.

Then, like a wrestler, he replied, you must put yourself again in the same position; and let me ask the same questions, and do you give me the same answer which you were about to give me then.

Yes, if I can, I will, I said.

I shall particularly wish to hear what were the four constitutions of which you were speaking.

That question, I said, is easily answered: the four governments of which I spoke, so far as they have distinct names, are first, those of Crete and Sparta, which are generally applauded; what is termed oligarchy comes next; this is not equally approved, and is a form of government which teems with evils: thirdly, democracy, which naturally follows oligarchy, although very different: and lastly comes tyranny, great and famous, which differs from them all, and is the fourth and worst disorder of a State. I do not know, do you? of any other constitution which can be said to have a distinct character. There are lordships and principalities which are bought and sold, and some other intermediate forms of government. But these are nondescripts and may be found equally among Hellenes and among barbarians.

Yes, he replied, we certainly hear of many curious forms of government which exist among them.

Do you know, I said, that governments vary as the dispositions of men vary, and that there must be as many of the one as there are of the other? For we cannot suppose that States are made of "oak and rock," and not out of the human natures which are in them, and which in a figure turn the scale and draw other things after them?

Yes, he said, the States are as the men are; they grow out of human characters.

Then if the constitutions of States are five, the dispositions of individual minds will also be five?

Certainly.

Him who answers to aristocracy, and whom we rightly call just and good, we have already described.

We have.

Then let us now proceed to describe the inferior sort of natures, being the contentious and ambitious, who answer to the Spartan polity; also the oligarchical, democratical, and tyrannical. Let us place the most just by the side of the most unjust, and when we see them we shall be able to compare the relative happiness or unhappiness of him who leads a life of pure justice or pure injustice. The inquiry will then be completed. And we shall know whether we ought to pursue injustice, as Thrasymachus advises, or in accordance with the conclusions of the argument to prefer justice.

Certainly, he replied, we must do as you say.

Shall we follow our old plan, which we adopted with a view to clearness, of taking the State first and then proceeding to the individual, and begin with the government of honor? -- I know of no name for such a government other than timocracy or perhaps timarchy. We will compare with

this the like character in the individual; and, after that, consider oligarchy and the oligarchical man; and then again we will turn our attention to democracy and the democratical man; and lastly, we will go and view the city of tyranny, and once more take a look into the tyrant's soul, and try to arrive at a satisfactory decision.

That way of viewing and judging of the matter will be very suitable.

First, then, I said, let us inquire how timocracy (the government of honor) arises out of aristocracy (the government of the best). Clearly, all political changes originate in divisions of the actual governing power; a government which is united, however small, cannot be moved.

Very true, he said.

In what way, then, will our city be moved, and in what manner will the two classes of auxiliaries and rulers disagree among themselves or with one another? Shall we, after the manner of Homer, pray the muses to tell us "how discord first arose"? Shall we imagine them in solemn mockery, to play and jest with us as if we were children, and to address us in a lofty tragic vein, making believe to be in earnest?

How would they address us?

After this manner: A city which is thus constituted can hardly be shaken; but, seeing that everything which has a beginning has also an end, even a constitution such as yours will not last forever, but will in time be dissolved. And this is the dissolution: In plants that grow in the earth, as well as in animals that move on the earth's surface, fertility and sterility of soul and body occur when the circumferences of the circles of each are completed, which in shortlived existences pass over a short space, and in longlived ones over a long space. But to the knowledge of human fecundity and sterility all the wisdom and education of your rulers will not attain; the laws which regulate them will not be discovered by an intelligence which is alloyed with sense, but will escape them, and they will bring children into the world when they ought not. Now that which is of divine birth has a period which is contained in a perfect number, but the period of human birth is comprehended in a number in which first increments by involution and evolution (or squared and cubed) obtaining three intervals and four terms of like and unlike, waxing and waning numbers, make all the terms commensurable and agreeable to one another. The base of these (3) with a third added (4), when combined with five (20) and raised to the third power, furnishes two harmonies; the first a square which is 100 times as great (400 = 4 x 100), and the other a figure having one side equal to the former, but oblong, consisting of 100 numbers squared upon rational diameters of a square (i.e., omitting fractions), the side of which is five (7 x 7 = 49 x 100 = 4900), each of them being less by one (than the perfect square which includes the fractions, sc. 50) or less by two perfect squares of irrational diameters (of a square the side of which is five = 50 + 50 =

100); and 100 cubes of three (27 x 100 = 2700 + 4900 + 400 = 8000). Now this number represents a geometrical figure which has control over the good and evil of births. For when your guardians are ignorant of the law of births, and unite bride and bridegroom out of season, the children will not be goodly or fortunate. And though only the best of them will be appointed by their predecessor, still they will be unworthy to hold their father's places, and when they come into power as guardians they will soon be found to fail in taking care of us, the muses, first by undervaluing music; which neglect will soon extend to gymnastics; and hence the young men of your State will be less cultivated. In the succeeding generation rulers will be appointed who have lost the guardian power of testing the metal of your different races, which, like Hesiod's, are of gold and silver and brass and iron. And so iron will be mingled with silver, and brass with gold, and hence there will arise dissimilarity and inequality and irregularity, which always and in all places are causes of hatred and war. This the muses affirm to be the stock from which discord has sprung, wherever arising; and this is their answer to us.

Yes, and we may assume that they answer truly.

Why, yes, I said, of course they answer truly; how can the muses speak falsely?

And what do the muses say next?

When discord arose, then the two races were drawn different ways: the iron and brass fell to acquiring money, and land, and houses, and gold, and silver; but the gold and silver races, not wanting money, but having the true riches in their own nature, inclined toward virtue and the ancient order of things. There was a battle between them, and at last they agreed to distribute their land and houses among individual owners; and they enslaved their friends and maintainers, whom they had formerly protected in the condition of freemen, and made of them subjects and servants; and they themselves were engaged in war and in keeping a watch against them.

I believe that you have rightly conceived the origin of the change.

And the new government which thus arises will be of a form intermediate between oligarchy and aristocracy?

Very true.

Such will be the change, and after the change has been made, how will they proceed? Clearly, the new State, being in a mean between oligarchy and the perfect State, will partly follow one and partly the other, and will also have some peculiarities.

True, he said.

In the honor given to rulers, in the abstinence of the warriorclass from agriculture, handicrafts, and trade in general, in the institution of common meals, and in the

attention paid to gymnastics and military training -- in all these respects this State will resemble the former.

True.

But in the fear of admitting philosophers to power, because they are no longer to be had simple and earnest, but are made up of mixed elements; and in turning from them to passionate and less complex characters, who are by nature fitted for war rather than peace; and in the value set by them upon military stratagems and contrivances, and in the waging of everlasting wars -- this State will be for the most part peculiar.

Yes.

Yes, I said; and men of this stamp will be covetous of money, like those who live in oligarchies; they will have a fierce secret longing after gold and silver, which they will hoard in dark places, having magazines and treasuries of their own for the deposit and concealment of them; also castles which are just nests for their eggs, and in which they will spend large sums on their wives, or on any others whom they please.

That is most true, he said.

And they are miserly because they have no means of openly acquiring the money which they prize; they will spend that which is another man's on the gratification of their desires, stealing their pleasures and running away like children from the law, their father: they have been schooled not by gentle influences but by force, for they have neglected her who is the true muse, the companion of reason and philosophy, and have honored gymnastics more than music.

Undoubtedly, he said, the form of government which you describe is a mixture of good and evil.

Why, there is a mixture, I said; but one thing, and one thing only, is predominantly seen -- the spirit of contention and ambition; and these are due to the prevalence of the passionate or spirited element.

Assuredly, he said.

Such is the origin and such the character of this State, which has been described in outline only; the more perfect execution was not required, for a sketch is enough to show the type of the most perfectly just and most perfectly unjust; and to go through all the States and all the characters of men, omitting none of them, would be an interminable labor.

Very true, he replied.

Now what man answers to this form of government -- how did he come into being, and what is he like?

I think, said Adeimantus, that in the spirit of contention which characterizes him, he is not unlike our

friend Glaucon.

Perhaps, I said, he may be like him in that one point; but there are other respects in which he is very different.

In what respects?

He should have more of selfassertion and be less cultivated and yet a friend of culture; and he should be a good listener but no speaker. Such a person is apt to be rough with slaves, unlike the educated man, who is too proud for that; and he will also be courteous to freemen, and remarkably obedient to authority; he is a lover of power and a lover of honor; claiming to be a ruler, not because he is eloquent, or on any ground of that sort, but because he is a soldier and has performed feats of arms; he is also a lover of gymnastic exercises and of the chase.

Yes, that is the type of character that answers to timocracy.

Such a one will despise riches only when he is young; but as he gets older he will be more and more attracted to them, because he has a piece of the avaricious nature in him, and is not singleminded toward virtue, having lost his best guardian.

Who was that? said Adeimantus.

Philosophy, I said, tempered with music, who comes and takes up her abode in a man, and is the only saviour of his virtue throughout life.

Good, he said.

Such, I said, is the timocratical youth, and he is like the timocratical State.

Exactly.

His origin is as follows: He is often the young son of a brave father, who dwells in an illgoverned city, of which he declines the honors and offices, and will not go to law, or exert himself in any way, but is ready to waive his rights in order that he may escape trouble.

And how does the son come into being?

The character of the son begins to develop when he hears his mother complaining that her husband has no place in the government, of which the consequence is that she has no precedence among other women. Further, when she sees her husband not very eager about money, and instead of battling and railing in the law courts or assembly, taking whatever happens to him quietly; and when she observes that his thoughts always centre in himself, while he treats her with very considerable indifference, she is annoyed, and says to her son that his father is only half a man and far too easygoing: adding all the other complaints about her own illtreatment which women are so fond of rehearsing.

Yes, said Adeimantus, they give us plenty of them, and their complaints are so like themselves.

And you know, I said, that the old servants also, who are supposed to be attached to the family, from time to time talk privately in the same strain to the son; and if they see anyone who owes money to his father, or is wronging him in any way, and he fails to prosecute them, they tell the youth that when he grows up he must retaliate upon people of this sort, and be more of a man than his father. He has only to walk abroad and he hears and sees the same sort of thing: those who do their own business in the city are called simpletons, and held in no esteem, while the busybodies are honored and applauded. The result is that the young man, hearing and seeing all these things -- hearing, too, the words of his father, and having a nearer view of his way of life, and making comparisons of him and others -- is drawn opposite ways: while his father is watering and nourishing the rational principle in his soul, the others are encouraging the passionate and appetitive; and he being not originally of a bad nature, but having kept bad company, is at last brought by their joint influence to a middle point, and gives up the kingdom which is within him to the middle principle of contentiousness and passion, and becomes arrogant and ambitious.

You seem to me to have described his origin perfectly.

Then we have now, I said, the second form of government and the second type of character?

We have.

Next, let us look at another man who, as AEschylus says,

"Is set over against another State;"

or rather, as our plan requires, begin with the State.

By all means.

I believe that oligarchy follows next in order.

And what manner of government do you term oligarchy?

A government resting on a valuation of property, in which the rich have power and the poor man is deprived of it.

I understand, he replied.

Ought I not to begin by describing how the change from timocracy to oligarchy arises?

Yes.

Well, I said, no eyes are required in order to see how the one passes into the other.

How?

The accumulation of gold in the treasury of private individuals is the ruin of timocracy; they invent illegal modes of expenditure; for what do they or their wives care about the law?

Yes, indeed.

And then one, seeing another grow rich, seeks to rival him, and thus the great mass of the citizens become lovers of money.

Likely enough.

And so they grow richer and richer, and the more they think of making a fortune the less they think of virtue; for when riches and virtue are placed together in the scales of the balance the one always rises as the other falls.

True.

And in proportion as riches and rich men are honored in the State, virtue and the virtuous are dishonored.

Clearly.

And what is honored is cultivated, and that which has no honor is neglected.

That is obvious.

And so at last, instead of loving contention and glory, men become lovers of trade and money; they honor and look up to the rich man, and make a ruler of him, and dishonor the poor man.

They do so.

They next proceed to make a law which fixes a sum of money as the qualification of citizenship; the sum is higher in one place and lower in another, as the oligarchy is more or less exclusive; and they allow no one whose property falls below the amount fixed to have any share in the government. These changes in the constitution they effect by force of arms, if intimidation has not already done their work.

Very true.

And this, speaking generally, is the way in which oligarchy is established.

Yes, he said; but what are the characteristics of this form of government, and what are the defects of which we were speaking?

First of all, I said, consider the nature of the qualification Just think what would happen if pilots were to be chosen according to their property, and a poor man were refused permission to steer, even though he were a better pilot?

You mean that they would shipwreck?

Yes; and is not this true of the government of anything?

I should imagine so.

Except a city? -- or would you include a city?

Nay, he said, the case of a city is the strongest of all, inasmuch as the rule of a city is the greatest and most difficult of all.

This, then, will be the first great defect of oligarchy?

Clearly.

And here is another defect which is quite as bad.

What defect?

The inevitable division: such a State is not one, but two States, the one of poor, the other of rich men; and they are living on the same spot and always conspiring against one another.

That, surely, is at least as bad.

Another discreditable feature is, that, for a like reason, they are incapable of carrying on any war. Either they arm the multitude, and then they are more afraid of them than of the enemy; or, if they do not call them out in the hour of battle, they are oligarchs indeed, few to fight as they are few to rule. And at the same time their fondness for money makes them unwilling to pay taxes.

How discreditable!

And, as we said before, under such a constitution the same persons have too many callings -- they are husbandmen, tradesmen, warriors, all in one. Does that look well?

Anything but well.

There is another evil which is, perhaps, the greatest of all, and to which this State first begins to be liable.

What evil?

A man may sell all that he has, and another may acquire his property; yet after the sale he may dwell in the city of which he is no longer a part, being neither trader, nor artisan, nor horseman, nor hoplite, but only a poor, helpless creature.

Yes, that is an evil which also first begins in this State.

The evil is certainly not prevented there; for

oligarchies have both the extremes of great wealth and utter poverty.

True.

But think again: In his wealthy days, while he was spending his money, was a man of this sort a whit more good to the State for the purposes of citizenship? Or did he only seem to be a member of the ruling body, although in truth he was neither ruler nor subject, but just a spendthrift?

As you say, he seemed to be a ruler, but was only a spendthrift.

May we not say that this is the drone in the house who is like the drone in the honeycomb, and that the one is the plague of the city as the other is of the hive?

Just so, Socrates.

And God has made the flying drones, Adeimantus, all without stings, whereas of the walking drones he has made some without stings, but others have dreadful stings; of the stingless class are those who in their old age end as paupers; of the stingers come all the criminal class, as they are termed.

Most true, he said.

Clearly then, whenever you see paupers in a State, somewhere in that neighborhood there are hidden away thieves and cutpurses and robbers of temples, and all sorts of malefactors.

Clearly.

Well, I said, and in oligarchical States do you not find paupers?

Yes, he said; nearly everybody is a pauper who is not a ruler.

And may we be so bold as to affirm that there are also many criminals to be found in them, rogues who have stings, and whom the authorities are careful to restrain by force?

Certainly, we may be so bold.

The existence of such persons is to be attributed to want of education, illtraining, and an evil constitution of the State?

True.

Such, then, is the form and such are the evils of oligarchy; and there may be many other evils.

Very likely.

Then oligarchy, or the form of government in which the rulers are elected for their wealth, may now be dismissed.

Let us next proceed to consider the nature and origin of the individual who answers to this State.

By all means.

Does not the timocratical man change into the oligarchical on this wise?

How?

A time arrives when the representative of timocracy has a son: at first he begins by emulating his father and walking in his footsteps, but presently he sees him of a sudden foundering against the State as upon a sunken reef, and he and all that he has are lost; he may have been a general or some other high officer who is brought to trial under a prejudice raised by informers, and either put to death or exiled or deprived of the privileges of a citizen, and all his property taken from him.

Nothing more likely.

And the son has seen and known all this -- he is a ruined man, and his fear has taught him to knock ambition and passion headforemost from his bosom's throne; humbled by poverty he takes to moneymaking, and by mean and miserly savings and hard work gets a fortune together. Is not such a one likely to seat the concupiscent and covetous element on the vacant throne and to suffer it to play the great king within him, girt with tiara and chain and scimitar?

Most true, he replied.

And when he has made reason and spirit sit down on the ground obediently on either side of their sovereign, and taught them to know their place, he compels the one to think only of how lesser sums may be turned into larger ones, and will not allow the other to worship and admire anything but riches and rich men, or to be ambitious of anything so much as the acquisition of wealth and the means of acquiring it.

Of all changes, he said, there is none so speedy or so sure as the conversion of the ambitious youth into the avaricious one.

And the avaricious, I said, is the oligarchical youth?

Yes, he said; at any rate the individual out of whom he came is like the State out of which oligarchy came.

Let us then consider whether there is any likeness between them.

Very good.

First, then, they resemble one another in the value which they set upon wealth?

Certainly.

Also in their penurious, laborious character; the

individual only satisfies his necessary appetites, and confines his expenditure to them; his other desires he subdues, under the idea that they are unprofitable.

True.

He is a shabby fellow, who saves something out of everything and makes a purse for himself; and this is the sort of man whom the vulgar applaud. Is he not a true image of the State which he represents?

He appears to me to be so; at any rate money is highly valued by him as well as by the State.

You see that he is not a man of cultivation, I said.

I imagine not, he said; had he been educated he would never have made a blind god director of his chorus, or given him chief honor.

Excellent! I said. Yet consider: Must we not further admit that owing to this want of cultivation there will be found in him dronelike desires as of pauper and rogue, which are forcibly kept down by his general habit of life?

True.

Do you know where you will have to look if you want to discover his rogueries?

Where must I look?

You should see him where he has some great opportunity of acting dishonestly, as in the guardianship of an orphan.

Aye.

It will be clear enough then that in his ordinary dealings which give him a reputation for honesty, he coerces his bad passions by an enforced virtue; not making them see that they are wrong, or taming them by reason, but by necessity and fear constraining them, and because he trembles for his possessions.

To be sure.

Yes, indeed, my dear friend, but you will find that the natural desires of the drone commonly exist in him all the same whenever he has to spend what is not his own.

Yes, and they will be strong in him, too.

The man, then, will be at war with himself; he will be two men, and not one; but, in general, his better desires will be found to prevail over his inferior ones.

True.

For these reasons such a one will be more respectable than most people; yet the true virtue of a unanimous and harmonious soul will flee far away and never come near him.

I should expect so.

And surely the miser individually will be an ignoble competitor in a State for any prize of victory, or other object of honorable ambition; he will not spend his money in the contest for glory; so afraid is he of awakening his expensive appetites and inviting them to help and join in the struggle; in true oligarchical fashion he fights with a small part only of his resources, and the result commonly is that he loses the prize and saves his money.

Very true.

Can we any longer doubt, then, that the miser and moneymaker answers to the oligarchical State?

There can be no doubt.

Next comes democracy; of this the origin and nature have still to be considered by us; and then we will inquire into the ways of the democratic man, and bring him up for judgment.

That, he said, is our method.

Well, I said, and how does the change from oligarchy into democracy arise? Is it not on this wise: the good at which such a State aims is to become as rich as possible, a desire which is insatiable?

What then?

The rulers being aware that their power rests upon their wealth, refuse to curtail by law the extravagance of the spendthrift youth because they gain by their ruin; they take interest from them and buy up their estates and thus increase their own wealth and importance?

To be sure.

There can be no doubt that the love of wealth and the spirit of moderation cannot exist together in citizens of the same State to any considerable extent; one or the other will be disregarded.

That is tolerably clear.

And in oligarchical States, from the general spread of carelessness and extravagance, men of good family have often been reduced to beggary?

Yes, often.

And still they remain in the city; there they are, ready to sting and fully armed, and some of them owe money, some have forfeited their citizenship; a third class are in both predicaments; and they hate and conspire against those who have got their property, and against everybody else, and are eager for revolution.

That is true.

On the other hand, the men of business, stooping as they walk, and pretending not even to see those whom they have already ruined, insert their sting -- that is, their money -- into someone else who is not on his guard against them, and recover the parent sum many times over multiplied into a family of children: and so they make drone and pauper to abound in the State.

Yes, he said, there are plenty of them -- that is certain.

The evil blazes up like a fire; and they will not extinguish it either by restricting a man's use of his own property, or by another remedy.

What other?

One which is the next best, and has the advantage of compelling the citizens to look to their characters: Let there be a general rule that everyone shall enter into voluntary contracts at his own risk, and there will be less of this scandalous moneymaking, and the evils of which we were speaking will be greatly lessened in the State.

Yes, they will be greatly lessened.

At present the governors, induced by the motives which I have named, treat their subjects badly; while they and their adherents, especially the young men of the governing class, are habituated to lead a life of luxury and idleness both of body and mind; they do nothing, and are incapable of resisting either pleasure or pain.

Very true.

They themselves care only for making money, and are as indifferent as the pauper to the cultivation of virtue.

Yes, quite as indifferent.

Such is the state of affairs which prevails among them. And often rulers and their subjects may come in one another's way, whether on a journey or on some other occasion of meeting, on a pilgrimage or a march, as fellowsoldiers or fellowsailors; aye, and they may observe the behavior of each other in the very moment of danger -- for where danger is, there is no fear that the poor will be despised by the rich -- and very likely the wiry, sunburnt poor man may be placed in battle at the side of a wealthy one who has never spoilt his complexion and has plenty of superfluous flesh -- when he sees such a one puffing and at his wits'end, how can he avoid drawing the conclusion that men like him are only rich because no one has the courage to despoil them? And when they meet in private will not people be saying to one another, "Our warriors are not good for much"?

Yes, he said, I am quite aware that this is their way of talking.

And, as in a body which is diseased the addition of a touch from without may bring on illness, and sometimes even when there is no external provocation, a commotion may arise within -- in the same way wherever there is weakness in the State there is also likely to be illness, of which the occasion may be very slight, the one party introducing from without their oligarchical, the other their democratical allies, and then the State falls sick, and is at war with herself; and may be at times distracted, even when there is no external cause.

Yes, surely.

And then democracy comes into being after the poor have conquered their opponents, slaughtering some and banishing some, while to the remainder they give an equal share of freedom and power; and this is the form of government in which the magistrates are commonly elected by lot.

Yes, he said, that is the nature of democracy, whether the revolution has been effected by arms, or whether fear has caused the opposite party to withdraw.

And now what is their manner of life, and what sort of a government have they? for as the government is, such will be the man.

Clearly, he said.

In the first place, are they not free; and is not the city full of freedom and frankness -- a man may say and do what he likes?

'Tis said so, he replied.

And where freedom is, the individual is clearly able to order for himself his own life as he pleases?

Clearly.

Then in this kind of State there will be the greatest variety of human natures?

There will.

This, then, seems likely to be the fairest of States, being like an embroidered robe which is spangled with every sort of flower. And just as women and children think a variety of colors to be of all things most charming, so there are many men to whom this State, which is spangled with the manners and characters of mankind, will appear to be the fairest of States.

Yes.

Yes, my good sir, and there will be no better in which to look for a government.

Why?

Because of the liberty which reigns there -- they have a complete assortment of constitutions; and he who has a mind to establish a State, as we have been doing, must go to a democracy as he would to a bazaar at which they sell them, and pick out the one that suits him; then, when he has made his choice, he may found his State.

He will be sure to have patterns enough.

And there being no necessity, I said, for you to govern in this State, even if you have the capacity, or to be governed, unless you like, or to go to war when the rest go to war, or to be at peace when others are at peace, unless you are so disposed -- there being no necessity also, because some law forbids you to hold office or be a dicast, that you should not hold office or be a dicast, if you have a fancy -- is not this a way of life which for the moment is supremely delightful?

For the moment, yes.

And is not their humanity to the condemned in some cases quite charming? Have you not observed how, in a democracy, many persons, although they have been sentenced to death or exile, just stay where they are and walk about the world -- the gentleman parades like a hero, and nobody sees or cares?

Yes, he replied, many and many a one. See, too, I said, the forgiving spirit of democracy, and the "don't care" about trifles, and the disregard which she shows of all the fine principles which we solemnly laid down at the foundation of the city -- as when we said that, except in the case of some rarely gifted nature, there never will be a good man who has not from his childhood been used to play amid things of beauty and make of them a joy and a study -- how grandly does she trample all these fine notions of ours under her feet, never giving a thought to the pursuits which make a statesman, and promoting to honor anyone who professes to be the people's friend.

Yes, she is of a noble spirit.

These and other kindred characteristics are proper to democracy, which is a charming form of government, full of variety and disorder, and dispensing a sort of equality to equals and unequals alike.

We know her well.

Consider now, I said, what manner of man the individual is, or rather consider, as in the case of the State, how he comes into being.

Very good, he said.

Is not this the way -- he is the son of the miserly and oligarchical father who has trained him in his own habits?

Exactly.

And, like his father, he keeps under by force the pleasures which are of the spending and not of the getting sort, being those which are called unnecessary?

Obviously.

Would you like, for the sake of clearness, to distinguish which are the necessary and which are the unnecessary pleasures?

I should.

Are not necessary pleasures those of which we cannot get rid, and of which the satisfaction is a benefit to us? And they are rightly called so, because we are framed by nature to desire both what is beneficial and what is necessary, and cannot help it.

True.

We are not wrong therefore in calling them necessary?

We are not.

And the desires of which a man may get rid, if he takes pains from his youth upward -- of which the presence, moreover, does no good, and in some cases the reverse of good -- shall we not be right in saying that all these are unnecessary?

Yes, certainly.

Suppose we select an example of either kind, in order that we may have a general notion of them?

Very good.

Will not the desire of eating, that is, of simple food and condiments, in so far as they are required for health and strength, be of the necessary class?

That is what I should suppose.

The pleasure of eating is necessary in two ways; it does us good and it is essential to the continuance of life?

Yes.

But the condiments are only necessary in so far as they are good for health?

Certainly.

And the desire which goes beyond this, of more delicate food, or other luxuries, which might generally be got rid of, if controlled and trained in youth, and is hurtful to the body, and hurtful to the soul in the pursuit of wisdom and virtue, may be rightly called unnecessary?

Very true.

May we not say that these desires spend, and that the others make money because they conduce to production?

Certainly.

And of the pleasures of love, and all other pleasures, the same holds good?

True.

And the drone of whom we spoke was he who was surfeited in pleasures and desires of this sort, and was the slave of the unnecessary desires, whereas he who was subject to the necessary only was miserly and oligarchical?

Very true.

Again, let us see how the democratical man goes out of the oligarchical: the following, as I suspect, is commonly the process.

What is the process?

When a young man who has been brought up as we were just now describing, in a vulgar and miserly way, has tasted drones' honey and has come to associate with fierce and crafty natures who are able to provide for him all sorts of refinements and varieties of pleasure -- then, as you may imagine, the change will begin of the oligarchical principle within him into the democratical?

Inevitably.

And as in the city like was helping like, and the change was effected by an alliance from without assisting one division of the citizens, so too the young man is changed by a class of desires coming from without to assist the desires within him, that which is akin and alike again helping that which is akin and alike?

Certainly.

And if there be any ally which aids the oligarchical principle within him, whether the influence of a father or of kindred, advising or rebuking him, then there arise in his soul a faction and an opposite faction, and he goes to war with himself.

It must be so.

And there are times when the democratical principle gives way to the oligarchical, and some of his desires die, and others are banished; a spirit of reverence enters into the young man's soul, and order is restored.

Yes, he said, that sometimes happens.

And then, again, after the old desires have been driven out, fresh ones spring up, which are akin to them, and because he their father does not know how to educate them, wax fierce and numerous.

Yes, he said, that is apt to be the way.

They draw him to his old associates, and holding secret intercourse with them, breed and multiply in him.

Very true.

At length they seize upon the citadel of the young man's soul, which they perceive to be void of all accomplishments and fair pursuits and true words, which make their abode in the minds of men who are dear to the gods, and are their best guardians and sentinels.

None better.

False and boastful conceits and phrases mount upward and take their place.

They are certain to do so.

And so the young man returns into the country of the lotuseaters, and takes up his dwelling there, in the face of all men; and if any help be sent by his friends to the oligarchical part of him, the aforesaid vain conceits shut the gate of the King's fastness; and they will neither allow the embassy itself to enter, nor if private advisers offer the fatherly counsel of the aged will they listen to them or receive them. There is a battle and they gain the day, and then modesty, which they call silliness, is ignominiously thrust into exile by them, and temperance, which they nickname unmanliness, is trampled in the mire and cast forth; they persuade men that moderation and orderly expenditure are vulgarity and meanness, and so, by the help of a rabble of evil appetites, they drive them beyond the border.

Yes, with a will.

And when they have emptied and swept clean the soul of him who is now in their power and who is being initiated by them in great mysteries, the next thing is to bring back to their house insolence and anarchy and waste and impudence in bright array, having garlands on their heads, and a great company with them, hymning their praises and calling them by sweet names; insolence they term "breeding," and anarchy "liberty," and waste "magnificence," and impudence "courage." And so the young man passes out of his original nature, which was trained in the school of necessity, into the freedom and libertinism of useless and unnecessary pleasures.

Yes, he said, the change in him is visible enough.

After this he lives on, spending his money and labor and time on unnecessary pleasures quite as much as on necessary ones; but if he be fortunate, and is not too much disordered in his wits, when years have elapsed, and the heyday of passion is over -- supposing that he then readmits into the city some part of the exiled virtues, and does not wholly give himself up to their successors -- in that case

he balances his pleasures and lives in a sort of equilibrium, putting the government of himself into the hands of the one which comes first and wins the turn; and when he has had enough of that, then into the hands of another; he despises none of them, but encourages them all equally.

Very true, he said.

Neither does he receive or let pass into the fortress any true word of advice; if anyone says to him that some pleasures are the satisfactions of good and noble desires, and others of evil desires, and that he ought to use and honor some, and chastise and master the others -- whenever this is repeated to him he shakes his head and says that they are all alike, and that one is as good as another.

Yes, he said; that is the way with him.

Yes, I said, he lives from day to day indulging the appetite of the hour; and sometimes he is lapped in drink and strains of the flute; then he becomes a waterdrinker, and tries to get thin; then he takes a turn at gymnastics; sometimes idling and neglecting everything, then once more living the life of a philosopher; often he is busy with politics, and starts to his feet and says and does whatever comes into his head; and, if he is emulous of anyone who is a warrior, off he is in that direction, or of men of business, once more in that. His life has neither law nor order; and this distracted existence he terms joy and bliss and freedom; and so he goes on.

Yes, he replied, he is all liberty and equality.

Yes, I said; his life is motley and manifold and an epitome of the lives of many; he answers to the State which we described as fair and spangled. And many a man and many a woman will take him for their pattern, and many a constitution and many an example of manners are contained in him.

Just so.

Let him then be set over against democracy; he may truly be called the democratic man.

Let that be his place, he said.

Last of all comes the most beautiful of all, man and State alike, tyranny and the tyrant; these we have now to consider.

Quite true, he said.

Say then, my friend, in what manner does tyranny arise? -- that it has a democratic origin is evident.

Clearly.

And does not tyranny spring from democracy in the same manner as democracy from oligarchy -- I mean, after a sort?

How?

The good which oligarchy proposed to itself and the means by which it was maintained was excess of wealth -- am I not right?

Yes.

And the insatiable desire of wealth and the neglect of all other things for the sake of moneygetting were also the ruin of oligarchy?

True.

And democracy has her own good, of which the insatiable desire brings her to dissolution?

What good?

Freedom, I replied; which, as they tell you in a democracy, is the glory of the State -- and that therefore in a democracy alone will the freeman of nature deign to dwell.

Yes; the saying is in everybody's mouth.

I was going to observe, that the insatiable desire of this and the neglect of other things introduce the change in democracy, which occasions a demand for tyranny.

How so?

When a democracy which is thirsting for freedom has evil cupbearers presiding over the feast, and has drunk too deeply of the strong wine of freedom, then, unless her rulers are very amenable and give a plentiful draught, she calls them to account and punishes them, and says that they are cursed oligarchs.

Yes, he replied, a very common occurrence.

Yes, I said; and loyal citizens are insultingly termed by her "slaves" who hug their chains, and men of naught; she would have subjects who are like rulers, and rulers who are like subjects: these are men after her own heart, whom she praises and honors both in private and public. Now, in such a State, can liberty have any limit?

Certainly not.

By degrees the anarchy finds a way into private houses, and ends by getting among the animals and infecting them.

How do you mean?

I mean that the father grows accustomed to descend to the level of his sons and to fear them, and the son is on a level with his father, he having no respect or reverence for either of his parents; and this is his freedom; and the metic is equal with the citizen, and the citizen with the

metic, and the stranger is quite as good as either.

Yes, he said, that is the way.

And these are not the only evils, I said -- there are several lesser ones: In such a state of society the master fears and flatters his scholars, and the scholars despise their masters and tutors; young and old are all alike; and the young man is on a level with the old, and is ready to compete with him in word or deed; and old men condescend to the young and are full of pleasantry and gayety; they are loth to be thought morose and authoritative, and therefore they adopt the manners of the young.

Quite true, he said.

The last extreme of popular liberty is when the slave bought with money, whether male or female, is just as free as his or her purchaser; nor must I forget to tell of the liberty and equality of the two sexes in relation to each other.

Why not, as AEschylus says, utter the word which rises to our lips?

That is what I am doing, I replied; and I must add that no one who does not know would believe how much greater is the liberty which the animals who are under the dominion of man have in a democracy than in any other State: for, truly, the shedogs, as the proverb says, are as good as their shemistresses, and the horses and asses have a way of marching along with all the rights and dignities of freemen; and they will run at anybody who comes in their way if he does not leave the road clear for them: and all things are just ready to burst with liberty.

When I take a country walk, he said, I often experience what you describe. You and I have dreamed the same thing.

And above all, I said, and as the result of all, see how sensitive the citizens become; they chafe impatiently at the least touch of authority, and at length, as you know, they cease to care even for the laws, written or unwritten; they will have no one over them.

Yes, he said, I know it too well.

Such, my friend, I said, is the fair and glorious beginning out of which springs tyranny.

Glorious indeed, he said. But what is the next step?

The ruin of oligarchy is the ruin of democracy; the same disease magnified and intensified by liberty overmasters democracy -- the truth being that the excessive increase of anything often causes a reaction in the opposite direction; and this is the case not only in the seasons and in vegetable and animal life, but above all in forms of government.

True.

The excess of liberty, whether in States or individuals, seems only to pass into excess of slavery.

Yes, the natural order.

And so tyranny naturally arises out of democracy, and the most aggravated form of tyranny and slavery out of the most extreme form of liberty?

As we might expect.

That, however, was not, as I believe, your question -- you rather desired to know what is that disorder which is generated alike in oligarchy and democracy, and is the ruin of both?

Just so, he replied.

Well, I said, I meant to refer to the class of idle spendthrifts, of whom the more courageous are the leaders and the more timid the followers, the same whom we were comparing to drones, some stingless, and others having stings.

A very just comparison.

These two classes are the plagues of every city in which they are generated, being what phlegm and bile are to the body. And the good physician and lawgiver of the State ought, like the wise beemaster, to keep them at a distance and prevent, if possible, their ever coming in; and if they have anyhow found a way in, then he should have them and their cells cut out as speedily as possible.

Yes, by all means, he said.

Then, in order that we may see clearly what we are doing, let us imagine democracy to be divided, as indeed it is, into three classes; for in the first place freedom creates rather more drones in the democratic than there were in the oligarchical State.

That is true.

And in the democracy they are certainly more intensified.

How so?

Because in the oligarchical State they are disqualified and driven from office, and therefore they cannot train or gather strength; whereas in a democracy they are almost the entire ruling power, and while the keener sort speak and act, the rest keep buzzing about the bema and do not suffer a word to be said on the other side; hence in democracies almost everything is managed by the drones.

Very true, he said.

Then there is another class which is always being

severed from the mass.

What is that?

They are the orderly class, which in a nation of traders is sure to be the richest.

Naturally so.

They are the most squeezable persons and yield the largest amount of honey to the drones.

Why, he said, there is little to be squeezed out of people who have little.

And this is called the wealthy class, and the drones feed upon them.

That is pretty much the case, he said.

The people are a third class, consisting of those who work with their own hands; they are not politicians, and have not much to live upon. This, when assembled, is the largest and most powerful class in a democracy.

True, he said; but then the multitude is seldom willing to congregate unless they get a little honey.

And do they not share? I said. Do not their leaders deprive the rich of their estates and distribute them among the people; at the same time taking care to reserve the larger part for themselves?

Why, yes, he said, to that extent the people do share.

And the persons whose property is taken from them are compelled to defend themselves before the people as they best can?

What else can they do?

And then, although they may have no desire of change, the others charge them with plotting against the people and being friends of oligarchy? True.

And the end is that when they see the people, not of their own accord, but through ignorance, and because they are deceived by informers, seeking to do them wrong, then at last they are forced to become oligarchs in reality; they do not wish to be, but the sting of the drones torments them and breeds revolution in them.

That is exactly the truth.

Then come impeachments and judgments and trials of one another.

True.

The people have always some champion whom they set over them and nurse into greatness.

Yes, that is their way. This, and no other, is the root from which a tyrant springs; when he first appears above ground he is a protector.

Yes, that is quite clear. How, then, does a protector begin to change into a tyrant? Clearly when he does what the man is said to do in the tale of the Arcadian temple of Lycaean Zeus.

What tale?

The tale is that he who has tasted the entrails of a single human victim minced up with the entrails of other victims is destined to become a wolf. Did you never hear it?

Oh, yes.

And the protector of the people is like him; having a mob entirely at his disposal, he is not restrained from shedding the blood of kinsmen; by the favorite method of false accusation he brings them into court and murders them, making the life of man to disappear, and with unholy tongue and lips tasting the blood of his fellowcitizens; some he kills and others he banishes, at the same time hinting at the abolition of debts and partition of lands: and after this, what will be his destiny? Must he not either perish at the hands of his enemies, or from being a man become a wolf -- that is, a tyrant?

Inevitably.

This, I said, is he who begins to make a party against the rich?

The same.

After a while he is driven out, but comes back, in spite of his enemies, a tyrant full grown.

That is clear.

And if they are unable to expel him, or to get him condemned to death by a public accusation, they conspire to assassinate him.

Yes, he said, that is their usual way.

Then comes the famous request for a bodyguard, which is the device of all those who have got thus far in their tyrannical career -- "Let not the people's friend," as they say, "be lost to them."

Exactly.

The people readily assent; all their fears are for him -- they have none for themselves.

Very true.

And when a man who is wealthy and is also accused of

being an enemy of the people sees this, then, my friend, as the oracle said to Croesus,

"By pebbly Hermus's shore he flees and rests not, and is not ashamed to be a coward."

And quite right too, said he, for if he were, he would never be ashamed again.

But if he is caught he dies.

Of course.

And he, the protector of whom we spoke, is to be seen, not "larding the plain" with his bulk, but himself the overthrower of many, standing up in the chariot of State with the reins in his hand, no longer protector, but tyrant absolute.

No doubt, he said.

And now let us consider the happiness of the man, and also of the State in which a creature like him is generated.

Yes, he said, let us consider that.

At first, in the early days of his power, he is full of smiles, and he salutes everyone whom he meets; he to be called a tyrant, who is making promises in public and also in private! liberating debtors, and distributing land to the people and his followers, and wanting to be so kind and good to everyone!

Of course, he said.

But when he has disposed of foreign enemies by conquest or treaty, and there is nothing to fear from them, then he is always stirring up some war or other, in order that the people may require a leader.

To be sure.

Has he not also another object, which is that they may be impoverished by payment of taxes, and thus compelled to devote themselves to their daily wants and therefore less likely to conspire against him? Clearly.

And if any of them are suspected by him of having notions of freedom, and of resistance to his authority, he will have a good pretext for destroying them by placing them at the mercy of the enemy; and for all these reasons the tyrant must be always getting up a war.

He must.

Now he begins to grow unpopular.

A necessary result.

Then some of those who joined in setting him up, and who are in power, speak their minds to him and to one

another, and the more courageous of them cast in his teeth what is being done.

Yes, that may be expected.

And the tyrant, if he means to rule, must get rid of them; he cannot stop while he has a friend or an enemy who is good for anything.

He cannot.

And therefore he must look about him and see who is valiant, who is highminded, who is wise, who is wealthy; happy man, he is the enemy of them all, and must seek occasion against them whether he will or no, until he has made a purgation of the State.

Yes, he said, and a rare purgation.

Yes, I said, not the sort of purgation which the physicians make of the body; for they take away the worse and leave the better part, but he does the reverse.

If he is to rule, I suppose that he cannot help himself.

What a blessed alternative, I said: to be compelled to dwell only with the many bad, and to be by them hated, or not to live at all!

Yes, that is the alternative.

And the more detestable his actions are to the citizens the more satellites and the greater devotion in them will he require?

Certainly.

And who are the devoted band, and where will he procure them?

They will flock to him, he said, of their own accord, if he pays them.

By the dog! I said, here are more drones, of every sort and from every land.

Yes, he said, there are.

But will he not desire to get them on the spot?

How do you mean?

He will rob the citizens of their slaves; he will then set them free and enrol them in his bodyguard.

To be sure, he said; and he will be able to trust them best of all.

What a blessed creature, I said, must this tyrant be; he has put to death the others and has these for his trusted

friends.

Yes, he said; they are quite of his sort.

Yes, I said, and these are the new citizens whom he has called into existence, who admire him and are his companions, while the good hate and avoid him.

Of course.

Verily, then, tragedy is a wise thing and Euripides a great tragedian.

Why so?

Why, because he is the author of the pregnant saying,

"Tyrants are wise by living with the wise;"

and he clearly meant to say that they are the wise whom the tyrant makes his companions.

Yes, he said, and he also praises tyranny as godlike; and many other things of the same kind are said by him and by the other poets.

And therefore, I said, the tragic poets being wise men will forgive us and any others who live after our manner, if we do not receive them into our State, because they are the eulogists of tyranny.

Yes, he said, those who have the wit will doubtless forgive us.

But they will continue to go to other cities and attract mobs, and hire voices fair and loud and persuasive, and draw the cities over to tyrannies and democracies.

Very true.

Moreover, they are paid for this and receive honor -- the greatest honor, as might be expected, from tyrants, and the next greatest from democracies; but the higher they ascend our constitution hill, the more their reputation fails, and seems unable from shortness of breath to proceed farther.

True.

But we are wandering from the subject: Let us therefore return and inquire how the tyrant will maintain that fair, and numerous, and various, and everchanging army of his.

If, he said, there are sacred treasures in the city, he will confiscate and spend them; and in so far as the fortunes of attainted persons may suffice, he will be able to diminish the taxes which he would otherwise have to impose upon the people.

And when these fail?

Why, clearly, he said, then he and his boon companions, whether male or female, will be maintained out of his father's estate.

You mean to say that the people, from whom he has derived his being, will maintain him and his companions?

Yes, he said; they cannot help themselves.

But what if the people fly into a passion, and aver that a grownup son ought not to be supported by his father, but that the father should be supported by the son? The father did not bring him into being, or settle him in life, in order that when his son became a man he should himself be the servant of his own servants and should support him and his rabble of slaves and companions; but that his son should protect him, and that by his help he might be emancipated from the government of the rich and aristocratic, as they are termed. And so he bids him and his companions depart, just as any other father might drive out of the house a riotous son and his undesirable associates.

By heaven, he said, then the parent will discover what a monster he has been fostering in his bosom; and, when he wants to drive him out, he will find that he is weak and his son strong.

Why, you do not mean to say that the tyrant will use violence? What! beat his father if he opposes him?

Yes, he will, having first disarmed him.

Then he is a parricide, and a cruel guardian of an aged parent; and this is real tyranny, about which there can be no longer a mistake: as the saying is, the people who would escape the smoke which is the slavery of freemen, has fallen into the fire which is the tyranny of slaves. Thus liberty, getting out of all order and reason, passes into the harshest and bitterest form of slavery.

True, he said.

Very well; and may we not rightly say that we have sufficiently discussed the nature of tyranny, and the manner of the transition from democracy to tyranny?

Yes, quite enough, he said.

* * * *

Book IX: On Wrong Or Right Government, And The Pleasures Of Each

(Socrates, Adeimantus.)

LAST of all comes the tyrannical man; about whom we have once more to ask, how is he formed out of the democratical? and how does he live, in happiness or in misery?

Yes, he said, he is the only one remaining.

There is, however, I said, a previous question which remains unanswered.

What question?

I do not think that we have adequately determined the nature and number of the appetites, and until this is accomplished the inquiry will always be confused.

Well, he said, it is not too late to supply the omission.

Very true, I said; and observe the point which I want to understand: Certain of the unnecessary pleasures and appetites I conceive to be unlawful; everyone appears to have them, but in some persons they are controlled by the laws and by reason, and the better desires prevail over them -- either they are wholly banished or they become few and weak; while in the case of others they are stronger, and there are more of them.

Which appetites do you mean?

I mean those which are awake when the reasoning and human and ruling power is asleep; then the wild beast within us, gorged with meat or drink, starts up and, having shaken off sleep, goes forth to satisfy his desires; and there is no conceivable folly or crime -- not excepting incest or any other unnatural union, or parricide, or the eating of forbidden food -- which at such a time, when he has parted company with all shame and sense, a man may not be ready to commit.

Most true, he said.

But when a man's pulse is healthy and temperate, and when before going to sleep he has awakened his rational powers, and fed them on noble thoughts and inquiries, collecting himself in meditation; after having first indulged his appetites neither too much nor too little, but just enough to lay them to sleep, and prevent them and their enjoyments and pains from interfering with the higher principle -- which he leaves in the solitude of pure abstraction, free to contemplate and aspire to the knowledge of the unknown, whether in past, present, or future: when again he has allayed the passionate element, if he has a quarrel against anyone -- I say, when, after pacifying the two irrational principles, he rouses up the third, which is reason, before he takes his rest, then, as you know, he attains truth most nearly, and is least likely to be the sport of fantastic and lawless visions.

I quite agree.

In saying this I have been running into a digression; but the point which I desire to note is that in all of us, even in good men, there is a lawless wildbeast nature, which peers out in sleep. Pray, consider whether I am right, and you agree with me.

Yes, I agree.

And now remember the character which we attributed to the democratic man. He was supposed from his youth upward to have been trained under a miserly parent, who encouraged the saving appetites in him, but discountenanced the unnecessary, which aim only at amusement and ornament?

True.

And then he got into the company of a more refined, licentious sort of people, and taking to all their wanton ways rushed into the opposite extreme from an abhorrence of his father's meanness. At last, being a better man than his corruptors, he was drawn in both directions until he halted midway and led a life, not of vulgar and slavish passion, but of what he deemed moderate indulgence in various pleasures. After this manner the democrat was generated out of the oligarch?

Yes, he said; that was our view of him, and is so still.

And now, I said, years will have passed away, and you must conceive this man, such as he is, to have a son, who is brought up in his father's principles.

I can imagine him.

Then you must further imagine the same thing to happen to the son which has already happened to the father: he is drawn into a perfectly lawless life, which by his seducers is termed perfect liberty; and his father and friends take part with his moderate desires, and the opposite party assist the opposite ones. As soon as these dire magicians and tyrantmakers find that they are losing their hold on him, they contrive to implant in him a masterpassion, to be lord over his idle and spendthrift lusts -- a sort of monstrous winged drone -- that is the only image which will adequately describe him.

Yes, he said, that is the only adequate image of him.

And when his other lusts, amid clouds of incense and perfumes and garlands and wines, and all the pleasures of a dissolute life, now let loose, come buzzing around him, nourishing to the utmost the sting of desire which they implant in his dronelike nature, then at last this lord of the soul, having Madness for the captain of his guard, breaks out into a frenzy; and if he finds in himself any good opinions or appetites in process of formation, and there is in him any sense of shame remaining, to these better principles he puts an end, and casts them forth until he has purged away temperance and brought in madness to the full.

Yes, he said, that is the way in which the tyrannical man is generated.

And is not this the reason why, of old, love has been called a tyrant?

I should not wonder.

Further, I said, has not a drunken man also the spirit of a tyrant?

He has.

And you know that a man who is deranged, and not right in his mind, will fancy that he is able to rule, not only over men, but also over the gods?

That he will.

And the tyrannical man in the true sense of the word comes into being when, either under the influence of nature or habit, or both, he becomes drunken, lustful, passionate? O my friend, is not that so?

Assuredly.

Such is the man and such is his origin. And next, how does he live?

Suppose, as people facetiously say, you were to tell me.

I imagine, I said, at the next step in his progress, that there will be feasts and carousals and revellings and courtesans, and all that sort of thing; Love is the lord of the house within him, and orders all the concerns of his soul.

That is certain.

Yes; and every day and every night desires grow up many and formidable, and their demands are many.

They are indeed, he said.

His revenues, if he has any, are soon spent.

True.

Then come debt and the cutting down of his property.

Of course.

When he has nothing left, must not his desires, crowding in the nest like young ravens, be crying aloud for food; and he, goaded on by them, and especially by love himself, who is in a manner the captain of them, is in a frenzy, and would fain discover whom he can defraud or despoil of his property, in order that he may gratify them?

Yes, that is sure to be the case.

He must have money, no matter how, if he is to escape horrid pains and pangs.

He must.

And as in himself there was a succession of pleasures, and the new got the better of the old and took away their rights, so he being younger will claim to have more than his father and his mother, and if he has spent his own share of the property, he will take a slice of theirs.

No doubt he will.

And if his parents will not give way, then he will try first of all to cheat and deceive them.

Very true.

And if he fails, then he will use force and plunder them.

Yes, probably.

And if the old man and woman fight for their own, what then, my friend? Will the creature feel any compunction at tyrannizing over them?

Nay, he said, I should not feel at all comfortable about his parents.

But, O heavens! Adeimantus, on account of some newfangled love of a harlot, who is anything but a necessary connection, can you believe that he would strike the mother who is his ancient friend and necessary to his very existence, and would place her under the authority of the other, when she is brought under the same roof with her; or that, under like circumstances, he would do the same to his withered old father, first and most indispensable of friends, for the sake of some newly found blooming youth who is the reverse of indispensable?

Yes, indeed, he said; I believe that he would.

Truly, then, I said, a tyrannical son is a blessing to his father and mother.

He is indeed, he replied.

He first takes their property, and when that fails, and pleasures are beginning to swarm in the hive of his soul, then he breaks into a house, or steals the garments of some nightly wayfarer; next he proceeds to clear a temple. Meanwhile the old opinions which he had when a child, and which gave judgment about good and evil, are overthrown by those others which have just been emancipated, and are now the bodyguard of love and share his empire. These in his democratic days, when he was still subject to the laws and to his father, were only let loose in the dreams of sleep. But now that he is under the dominion of Love, he becomes always and in waking reality what he was then very rarely and in a dream only; he will commit the foulest murder, or eat forbidden food, or be guilty of any other horrid act. Love is his tyrant, and lives lordly in him and lawlessly, and being himself a king, leads him on, as a tyrant leads a State, to the performance of any reckless deed by which he

can maintain himself and the rabble of his associates, whether those whom evil communications have brought in from without, or those whom he himself has allowed to break loose within him by reason of a similar evil nature in himself. Have we not here a picture of his way of life?

Yes, indeed, he said.

And if there are only a few of them in the State, and the rest of the people are well disposed, they go away and become the bodyguard of mercenary soldiers of some other tyrant who may probably want them for a war; and if there is no war, they stay at home and do many little pieces of mischief in the city.

What sort of mischief?

For example, they are the thieves, burglars, cutpurses, footpads, robbers of temples, manstealers of the community; or if they are able to speak, they turn informers and bear false witness and take bribes.

A small catalogue of evils, even if the perpetrators of them are few in number.

Yes, I said; but small and great are comparative terms, and all these things, in the misery and evil which they inflict upon a State, do not come within a thousand miles of the tyrant; when this noxious class and their followers grow numerous and become conscious of their strength, assisted by the infatuation of the people, they choose from among themselves the one who has most of the tyrant in his own soul, and him they create their tyrant.

Yes, he said, and he will be the most fit to be a tyrant.

If the people yield, well and good; but if they resist him, as he began by beating his own father and mother, so now, if he has the power, he beats them, and will keep his dear old fatherland or motherland, as the Cretans say, in subjection to his young retainers whom he has introduced to be their rulers and masters. This is the end of his passions and desires.

Exactly.

When such men are only private individuals and before they get power, this is their character; they associate entirely with their own flatterers or ready tools; or if they want anything from anybody, they in their turn are equally ready to bow down before them: they profess every sort of affection for them; but when they have gained their point they know them no more.

Yes, truly.

They are always either the masters or servants and never the friends of anybody; the tyrant never tastes of true freedom or friendship.

Certainly not.

And may we not rightly call such men treacherous?

No question.

Also they are utterly unjust, if we were right in our notion of justice?

Yes, he said, and we were perfectly right.

Let us, then, sum up in a word, I said, the character of the worst man: he is the waking reality of what we dreamed.

Most true.

And this is he who being by nature most of a tyrant bears rule, and the longer he lives the more of a tyrant he becomes.

That is certain, said Glaucon, taking his turn to answer.

And will not he who has been shown to be the wickedest, be also the most miserable? and he who has tyrannized longest and most, most continually and truly miserable; although this may not be the opinion of men in general?

Yes, he said, inevitably.

And must not the tyrannical man be like the tyrannical State, and the democratical man like the democratical State; and the same of the others?

Certainly.

And as State is to State in virtue and happiness, so is man in relation to man?

To be sure.

Then comparing our original city, which was under a king, and the city which is under a tyrant, how do they stand as to virtue?

They are the opposite extremes, he said, for one is the very best and the other is the very worst.

There can be no mistake, I said, as to which is which, and therefore I will at once inquire whether you would arrive at a similar decision about their relative happiness and misery. And here we must not allow ourselves to be panicstricken at the apparition of the tyrant, who is only a unit and may perhaps have a few retainers about him; but let us go as we ought into every corner of the city and look all about, and then we will give our opinion.

A fair invitation, he replied; and I see, as everyone must, that a tyranny is the wretchedest form of government, and the rule of a king the happiest.

And in estimating the men, too, may I not fairly make a like request, that I should have a judge whose mind can enter into and see through human nature? he must not be like a child who looks at the outside and is dazzled at the pompous aspect which the tyrannical nature assumes to the beholder, but let him be one who has a clear insight. May I suppose that the judgment is given in the hearing of us all by one who is able to judge, and has dwelt in the same place with him, and been present at his daily life and known him in his family relations, where he may be seen stripped of his tragedy attire, and again in the hour of public danger -- he shall tell us about the happiness and misery of the tyrant when compared with other men?

That again, he said, is a very fair proposal.

Shall I assume that we ourselves are able and experienced judges and have before now met with such a person? We shall then have someone who will answer our inquiries.

By all means.

Let me ask you not to forget the parallel of the individual and the State; bearing this in mind, and glancing in turn from one to the other of them, will you tell me their respective conditions?

What do you mean? he asked.

Beginning with the State, I replied, would you say that a city which is governed by a tyrant is free or enslaved?

No city, he said, can be more completely enslaved.

And yet, as you see, there are freemen as well as masters in such a State?

Yes, he said, I see that there are -- a few; but the people, speaking generally, and the best of them are miserably degraded and enslaved.

Then if the man is like the State, I said, must not the same rule prevail? His soul is full of meanness and vulgarity -- the best elements in him are enslaved; and there is a small ruling part, which is also the worst and maddest.

Inevitably.

And would you say that the soul of such a one is the soul of a freeman or of a slave?

He has the soul of a slave, in my opinion.

And the State which is enslaved under a tyrant is utterly incapable of acting voluntarily?

Utterly incapable.

And also the soul which is under a tyrant (I am speaking of the soul taken as a whole) is least capable of doing what she desires; there is a gadfly which goads her, and she is full of trouble and remorse?

Certainly.

And is the city which is under a tyrant rich or poor?

Poor.

And the tyrannical soul must be always poor and insatiable?

True.

And must not such a State and such a man be always full of fear?

Yes, indeed.

Is there any State in which you will find more of lamentation and sorrow and groaning and pain?

Certainly not.

And is there any man in whom you will find more of this sort of misery than in the tyrannical man, who is in a fury of passions and desires?

Impossible.

Reflecting upon these and similar evils, you held the tyrannical State to be the most miserable of States?

And I was right, he said.

Certainly, I said. And when you see the same evils in the tyrannical man, what do you say of him?

I say that he is by far the most miserable of all men.

There, I said, I think that you are beginning to go wrong.

What do you mean?

I do not think that he has as yet reached the utmost extreme of misery.

Then who is more miserable?

One of whom I am about to speak.

Who is that?

He who is of a tyrannical nature, and instead of leading a private life has been cursed with the further misfortune of being a public tyrant.

From what has been said, I gather that you are right.

Yes, I replied, but in this high argument you should be a little more certain, and should not conjecture only; for of all questions, this respecting good and evil is the greatest.

Very true, he said.

Let me then offer you an illustration, which may, I think, throw a light upon this subject.

What is your illustration?

The case of rich individuals in cities who possess many slaves: from them you may form an idea of the tyrant's condition, for they both have slaves; the only difference is that he has more slaves.

Yes, that is the difference.

You know that they live securely and have nothing to apprehend from their servants?

What should they fear?

Nothing. But do you observe the reason of this?

Yes; the reason is, that the whole city is leagued together for the protection of each individual.

Very true, I said. But imagine one of these owners, the master say of some fifty slaves, together with his family and property and slaves, carried off by a god into the wilderness, where there are no freemen to help him -- will he not be in an agony of fear lest he and his wife and children should be put to death by his slaves?

Yes, he said, he will be in the utmost fear.

The time has arrived when he will be compelled to flatter divers of his slaves, and make many promises to them of freedom and other things, much against his will -- he will have to cajole his own servants.

Yes, he said, that will be the only way of saving himself.

And suppose the same god, who carried him away, to surround him with neighbors who will not suffer one man to be the master of another, and who, if they could catch the offender, would take his life?

His case will be still worse, if you suppose him to be everywhere surrounded and watched by enemies.

And is not this the sort of prison in which the tyrant will be bound -- he who being by nature such as we have described, is full of all sorts of fears and lusts? His soul is dainty and greedy, and yet alone, of all men in the city, he is never allowed to go on a journey, or to see the things which other freemen desire to see, but he lives in his hole

like a woman hidden in the house, and is jealous of any other citizen who goes into foreign parts and sees anything of interest.

Very true, he said.

And amid evils such as these will not he who is illgoverned in his own person -- the tyrannical man, I mean -- whom you just now decided to be the most miserable of all -- will not he be yet more miserable when, instead of leading a private life, he is constrained by fortune to be a public tyrant? He has to be master of others when he is not master of himself: he is like a diseased or paralytic man who is compelled to pass his life, not in retirement, but fighting and combating with other men.

Yes, he said, the similitude is most exact.

Is not his case utterly miserable? and does not the actual tyrant lead a worse life than he whose life you determined to be the worst?

Certainly.

He who is the real tyrant, whatever men may think, is the real slave, and is obliged to practise the greatest adulation and servility, and to be the flatterer of the vilest of mankind. He has desires which he is utterly unable to satisfy, and has more wants than anyone, and is truly poor, if you know how to inspect the whole soul of him: all his life long he is beset with fear and is full of convulsions and distractions, even as the State which he resembles: and surely the resemblance holds?

Very true, he said.

Moreover, as we were saying before, he grows worse from having power: he becomes and is of necessity more jealous, more faithless, more unjust, more friendless, more impious, than he was at first; he is the purveyor and cherisher of every sort of vice, and the consequence is that he is supremely miserable, and that he makes everybody else as miserable as himself.

No man of any sense will dispute your words. Come, then, I said, and as the general umpire in theatrical contests proclaims the result, do you also decide who in your opinion is first in the scale of happiness, and who second, and in what order the others follow: there are five of them in all -- they are the royal, timocratical, oligarchical, democratical, tyrannical.

The decision will be easily given, he replied; they shall be choruses coming on the stage, and I must judge them in the order in which they enter, by the criterion of virtue and vice, happiness and misery.

Need we hire a herald, or shall I announce that the son of Ariston (the best) has decided that the best and justest is also the happiest, and that this is he who is the most royal man and king over himself; and that the worst and most

unjust man is also the most miserable, and that this is he who being the greatest tyrant of himself is also the greatest tyrant of his State?

Make the proclamation yourself, he said.

And shall I add, "whether seen or unseen by gods and men"?

Let the words be added.

Then this, I said, will be our first proof; and there is another, which may also have some weight.

What is that?

The second proof is derived from the nature of the soul: seeing that the individual soul, like the State, has been divided by us into three principles, the division may, I think, furnish a new demonstration.

Of what nature?

It seems to me that to these three principles three pleasures correspond; also three desires and governing powers.

How do you mean? he said.

There is one principle with which, as we were saying, a man learns, another with which he is angry; the third, having many forms, has no special name, but is denoted by the general term appetitive, from the extraordinary strength and vehemence of the desires of eating and drinking and the other sensual appetites which are the main elements of it; also moneyloving, because such desires are generally satisfied by the help of money.

That is true, he said.

If we were to say that the loves and pleasures of this third part were concerned with gain, we should then be able to fall back on a single notion; and might truly and intelligibly describe this part of the soul as loving gain or money.

I agree with you.

Again, is not the passionate element wholly set on ruling and conquering and getting fame?

True.

Suppose we call it the contentious or ambitious -- would the term be suitable?

Extremely suitable.

On the other hand, everyone sees that the principle of knowledge is wholly directed to the truth, and cares less than either of the others for gain or fame.

Far less.

"Lover of wisdom," "lover of knowledge," are titles which we may fitly apply to that part of the soul?

Certainly.

One principle prevails in the souls of one class of men, another in others, as may happen?

Yes.

Then we may begin by assuming that there are three classes of men -- lovers of wisdom, lovers of honor, lovers of gain?

Exactly.

And there are three kinds of pleasure, which are their several objects?

Very true.

Now, if you examine the three classes of men, and ask of them in turn which of their lives is pleasantest, each will be found praising his own and depreciating that of others: the moneymaker will contrast the vanity of honor or of learning if they bring no money with the solid advantages of gold and silver?

True, he said.

And the lover of honor -- what will be his opinion? Will he not think that the pleasure of riches is vulgar, while the pleasure of learning, if it brings no distinction, is all smoke and nonsense to him?

Very true.

And are we to suppose, I said, that the philosopher sets any value on other pleasures in comparison with the pleasure of knowing the truth, and in that pursuit abiding, ever learning, not so far indeed from the heaven of pleasure? Does he not call the other pleasures necessary, under the idea that if there were no necessity for them, he would rather not have them?

There can be no doubt of that, he replied.

Since, then, the pleasures of each class and the life of each are in dispute, and the question is not which life is more or less honorable, or better or worse, but which is the more pleasant or painless -- how shall we know who speaks truly?

I cannot myself tell, he said.

Well, but what ought to be the criterion? Is any better than experience, and wisdom, and reason?

There cannot be a better, he said.

Then, I said, reflect. Of the three individuals, which has the greatest experience of all the pleasures which we enumerated? Has the lover of gain, in learning the nature of essential truth, greater experience of the pleasure of knowledge than the philosopher has of the pleasure of gain?

The philosopher, he replied, has greatly the advantage; for he has of necessity always known the taste of the other pleasures from his childhood upward: but the lover of gain in all his experience has not of necessity tasted -- or, I should rather say, even had he desired, could hardly have tasted -- the sweetness of learning and knowing truth.

Then the lover of wisdom has a great advantage over the lover of gain, for he has a double experience?

Yes, very great.

Again, has he greater experience of the pleasures of honor, or the lover of honor of the pleasures of wisdom?

Nay, he said, all three are honored in proportion as they attain their object; for the rich man and the brave man and the wise man alike have their crowd of admirers, and as they all receive honor they all have experience of the pleasures of honor; but the delight which is to be found in the knowledge of true being is known to the philosopher only.

His experience, then, will enable him to judge better than anyone?

Far better.

And he is the only one who has wisdom as well as experience?

Certainly.

Further, the very faculty which is the instrument of judgment is not possessed by the covetous or ambitious man, but only by the philosopher?

What faculty?

Reason, with whom, as we were saying, the decision ought to rest.

Yes.

And reasoning is peculiarly his instrument?

Certainly.

If wealth and gain were the criterion, then the praise or blame of the lover of gain would surely be the most trustworthy?

Assuredly.

Or if honor, or victory, or courage, in that case the judgment of the ambitious or pugnacious would be the truest?

Clearly.

But since experience and wisdom and reason are the judges --

The only inference possible, he replied, is that pleasures which are approved by the lover of wisdom and reason are the truest.

And so we arrive at the result, that the pleasure of the intelligent part of the soul is the pleasantest of the three, and that he of us in whom this is the ruling principle has the pleasantest life.

Unquestionably, he said, the wise man speaks with authority when he approves of his own life.

And what does the judge affirm to be the life which is next, and the pleasure which is next?

Clearly that of the soldier and lover of honor; who is nearer to himself than the moneymaker.

Last comes the lover of gain?

Very true, he said.

Twice in succession, then, has the just man overthrown the unjust in this conflict; and now comes the third trial, which is dedicated to Olympian Zeus the saviour: a sage whispers in my ear that no pleasure except that of the wise is quite true and pure -- all others are a shadow only; and surely this will prove the greatest and most decisive of falls?

Yes, the greatest; but will you explain yourself?

I will work out the subject and you shall answer my questions.

Proceed.

Say, then, is not pleasure opposed to pain?

True.

And there is a neutral state which is neither pleasure nor pain?

There is.

A state which is intermediate, and a sort of repose of the soul about either -- that is what you mean?

Yes.

You remember what people say when they are sick?

What do they say?

That after all nothing is pleasanter than health. But then they never knew this to be the greatest of pleasures until they were ill.

Yes, I know, he said.

And when persons are suffering from acute pain, you must have heard them say that there is nothing pleasanter than to get rid of their pain?

I have.

And there are many other cases of suffering in which the mere rest and cessation of pain, and not any positive enjoyment, are extolled by them as the greatest pleasure?

Yes, he said; at the time they are pleased and well content to be at rest.

Again, when pleasure ceases, that sort of rest or cessation will be painful?

Doubtless, he said.

Then the intermediate state of rest will be pleasure and will also be pain?

So it would seem.

But can that which is neither become both?

I should say not.

And both pleasure and pain are motions of the soul, are they not?

Yes.

But that which is neither was just now shown to be rest and not motion, and in a mean between them?

Yes.

How, then, can we be right in supposing that the absence of pain is pleasure, or that the absence of pleasure is pain?

Impossible. This, then, is an appearance only, and not a reality; that is to say, the rest is pleasure at the moment and in comparison of what is painful, and painful in comparison of what is pleasant; but all these representations, when tried by the test of true pleasure, are not real, but a sort of imposition?

That is the inference.

Look at the other class of pleasures which have no antecedent pains and you will no longer suppose, as you

perhaps may at present, that pleasure is only the cessation of pain, or pain of pleasure.

What are they, he said, and where shall I find them?

There are many of them: take as an example, the pleasures of smell, which are very great and have no antecedent pains; they come in a moment, and when they depart leave no pain behind them.

Most true, he said.

Let us not, then, be induced to believe that pure pleasure is the cessation of pain, or pain of pleasure.

No.

Still, the more numerous and violent pleasures which reach the soul through the body are generally of this sort -- they are reliefs of pain.

That is true.

And the anticipations of future pleasures and pains are of a like nature?

Yes.

Shall I give you an illustration of them?

Let me hear.

You would allow, I said, that there is in nature an upper and lower and middle region?

I should.

And if a person were to go from the lower to the middle region, would he not imagine that he is going up; and he who is standing in the middle and sees whence he has come, would imagine that he is already in the upper region, if he has never seen the true upper world?

To be sure, he said; how can he think otherwise?

But if he were taken back again he would imagine, and truly imagine, that he was descending?

No doubt.

All that would arise out of his ignorance of the true upper and middle and lower regions?

Yes.

Then can you wonder that persons who are inexperienced in the truth, as they have wrong ideas about many other things, should also have wrong ideas about pleasure and pain and the intermediate state; so that when they are only being drawn toward the painful they feel pain and think the pain which they experience to be real, and in like manner, when

drawn away from pain to the neutral or intermediate state, they firmly believe that they have reached the goal of satiety and pleasure; they, not knowing pleasure, err in contrasting pain with the absence of pain, which is like contrasting black with gray instead of white -- can you wonder, I say, at this?

No, indeed; I should be much more disposed to wonder at the opposite.

Look at the matter thus: Hunger, thirst, and the like, are inanitions of the bodily state?

Yes.

And ignorance and folly are inanitions of the soul?

True.

And food and wisdom are the corresponding satisfactions of either?

Certainly.

And is the satisfaction derived from that which has less or from that which has more existence the truer?

Clearly, from that which has more.

What classes of things have a greater share of pure existence, in your judgment -- those of which food and drink and condiments and all kinds of sustenance are examples, or the class which contains true opinion and knowledge and mind and all the different kinds of virtue? Put the question in this way: Which has a more pure being -- that which is concerned with the invariable, the immortal, and the true, and is of such a nature, and is found in such natures; or that which is concerned with and found in the variable and mortal, and is itself variable and mortal?

Far purer, he replied, is the being of that which is concerned with the invariable.

And does the essence of the invariable partake of knowledge in the same degree as of essence?

Yes, of knowledge in the same degree.

And of truth in the same degree?

Yes.

And, conversely, that which has less of truth will also have less of essence?

Necessarily.

Then, in general, those kinds of things which are in the service of the body have less of truth and essence than those which are in the service of the soul?

Far less.

And has not the body itself less of truth and essence than the soul?

Yes.

What is filled with more real existence, and actually has a more real existence, is more really filled than that which is filled with less real existence and is less real?

Of course.

And if there be a pleasure in being filled with that which is according to nature, that which is more really filled with more real being will more really and truly enjoy true pleasure; whereas that which participates in less real being will be less truly and surely satisfied, and will participate in an illusory and less real pleasure?

Unquestionably. Those, then, who know not wisdom and virtue, and are always busy with gluttony and sensuality, go down and up again as far as the mean; and in this region they move at random throughout life, but they never pass into the true upper world; thither they neither look, nor do they ever find their way, neither are they truly filled with true being, nor do they taste of pure and abiding pleasure. Like cattle, with their eyes always looking down and their heads stooping to the earth, that is, to the diningtable, they fatten and feed and breed, and, in their excessive love of these delights, they kick and butt at one another with horns and hoofs which are made of iron; and they kill one another by reason of their insatiable lust. For they fill themselves with that which is not substantial, and the part of themselves which they fill is also unsubstantial and incontinent.

Verily, Socrates, said Glaucon, you describe the life of the many like an oracle.

Their pleasures are mixed with pains -- how can they be otherwise? For they are mere shadows and pictures of the true, and are colored by contrast, which exaggerates both light and shade, and so they implant in the minds of fools insane desires of themselves; and they are fought about as Stesichorus says that the Greeks fought about the shadow of Helen at Troy, in ignorance of the truth.

Something of that sort must inevitably happen.

And must not the like happen with the spirited or passionate element of the soul? Will not the passionate man who carries his passion into action, be in the like case, whether he is envious and ambitious, or violent and contentious, or angry and discontented, if he be seeking to attain honor and victory and the satisfaction of his anger without reason or sense?

Yes, he said, the same will happen with the spirited element also.

Then may we not confidently assert that the lovers of money and honor, when they seek their pleasures under the guidance and in the company of reason and knowledge, and pursue after and win the pleasures which wisdom shows them, will also have the truest pleasures in the highest degree which is attainable to them, inasmuch as they follow truth; and they will have the pleasures which are natural to them, if that which is best for each one is also most natural to him?

Yes, certainly; the best is the most natural.

And when the whole soul follows the philosophical principle, and there is no division, the several parts are just, and do each of them their own business, and enjoy severally the best and truest pleasures of which they are capable?

Exactly.

But when either of the two other principles prevails, it fails in attaining its own pleasure, and compels the rest to pursue after a pleasure which is a shadow only and which is not their own?

True.

And the greater the interval which separates them from philosophy and reason, the more strange and illusive will be the pleasure?

Yes.

And is not that farthest from reason which is at the greatest distance from law and order?

Clearly.

And the lustful and tyrannical desires are, as we saw, at the greatest distance? Yes.

And the royal and orderly desires are nearest?

Yes.

Then the tyrant will live at the greatest distance from true or natural pleasure, and the king at the least?

Certainly.

But if so, the tyrant will live most unpleasantly, and the king most pleasantly?

Inevitably.

Would you know the measure of the interval which separates them?

Will you tell me?

There appear to be three pleasures, one genuine and two

spurious: now the transgression of the tyrant reaches a point beyond the spurious; he has run away from the region of law and reason, and taken up his abode with certain slave pleasures which are his satellites, and the measure of his inferiority can only be expressed in a figure.

How do you mean?

I assume, I said, that the tyrant is in the third place from the oligarch; the democrat was in the middle?

Yes.

And if there is truth in what has preceded, he will be wedded to an image of pleasure which is thrice removed as to truth from the pleasure of the oligarch?

He will.

And the oligarch is third from the royal; since we count as one royal and aristocratical?

Yes, he is third.

Then the tyrant is removed from true pleasure by the space of a number which is three times three?

Manifestly.

The shadow, then, of tyrannical pleasure determined by the number of length will be a plane figure.

Certainly.

And if you raise the power and make the plane a solid, there is no difficulty in seeing how vast is the interval by which the tyrant is parted from the king.

Yes; the arithmetician will easily do the sum.

Or if some person begins at the other end and measures the interval by which the king is parted from the tyrant in truth of pleasure, he will find him, when the multiplication is completed, living 729 times more pleasantly, and the tyrant more painfully by this same interval.

What a wonderful calculation! And how enormous is the distance which separates the just from the unjust in regard to pleasure and pain!

Yet a true calculation, I said, and a number which nearly concerns human life, if human beings are concerned with days and nights and months and years.

Yes, he said, human life is certainly concerned with them.

Then if the good and just man be thus superior in pleasure to the evil and unjust, his superiority will be infinitely greater in propriety of life and in beauty and virtue?

Immeasurably greater.

Well, I said, and now having arrived at this stage of the argument, we may revert to the words which brought us hither: Was not someone saying that injustice was a gain to the perfectly unjust who was reputed to be just?

Yes, that was said. Now, then, having determined the power and quality of justice and injustice, let us have a little conversation with him.

What shall we say to him?

Let us make an image of the soul, that he may have his own words presented before his eyes.

Of what sort?

An ideal image of the soul, like the composite creations of ancient mythology, such as the Chimera, or Scylla, or Cerberus, and there are many others in which two or more different natures are said to grow into one.

There are said to have been such unions.

Then do you now model the form of a multitudinous, manyheaded monster, having a ring of heads of all manner of beasts, tame and wild, which he is able to generate and metamorphose at will.

You suppose marvellous powers in the artist; but, as language is more pliable than wax or any similar substance, let there be such a model as you propose.

Suppose now that you make a second form as of a lion, and a third of a man, the second smaller than the first, and the third smaller than the second.

That, he said, is an easier task; and I have made them as you say.

And now join them, and let the three grow into one.

That has been accomplished.

Next fashion the outside of them into a single image, as of a man, so that he who is not able to look within, and sees only the outer hull, may believe the beast to be a single human creature. I have done so, he said.

And now, to him who maintains that it is profitable for the human creature to be unjust, and unprofitable to be just, let us reply that, if he be right, it is profitable for this creature to feast the multitudinous monster and strengthen the lion and the lionlike qualities, but to starve and weaken the man, who is consequently liable to be dragged about at the mercy of either of the other two; and he is not to attempt to familiarize or harmonize them with one another -- he ought rather to suffer them to fight, and bite and devour one another.

Certainly, he said; that is what the approver of injustice says.

To him the supporter of justice makes answer that he should ever so speak and act as to give the man within him in some way or other the most complete mastery over the entire human creature.

He should watch over the manyheaded monster like a good husbandman, fostering and cultivating the gentle qualities, and preventing the wild ones from growing; he should be making the lionheart his ally, and in common care of them all should be uniting the several parts with one another and with himself.

Yes, he said, that is quite what the maintainer of justice will say.

And so from every point of view, whether of pleasure, honor, or advantage, the approver of justice is right and speaks the truth, and the disapprover is wrong and false and ignorant?

Yes, from every point of view.

Come, now, and let us gently reason with the unjust, who is not intentionally in error. "Sweet sir," we will say to him, "what think you of things esteemed noble and ignoble? Is not the noble that which subjects the beast to the man, or rather to the god in man? and the ignoble that which subjects the man to the beast?" He can hardly avoid saying, Yes -- can he, now? Not if he has any regard for my opinion. But, if he agree so far, we may ask him to answer another question: "Then how would a man profit if he received gold and silver on the condition that he was to enslave the noblest part of him to the worst? Who can imagine that a man who sold his son or daughter into slavery for money, especially if he sold them into the hands of fierce and evil men, would be the gainer, however large might be the sum which he received? And will anyone say that he is not a miserable caitiff who remorselessly sells his own divine being to that which is most godless and detestable? Eriphyle took the necklace as the price of her husband's life, but he is taking a bribe in order to compass a worse ruin."

Yes, said Glaucon, far worse -- I will answer for him.

Has not the intemperate been censured of old, because in him the huge multiform monster is allowed to be too much at large?

Clearly.

And men are blamed for pride and bad temper when the lion and serpent element in them disproportionately grows and gains strength?

Yes.

And luxury and softness are blamed, because they relax and weaken this same creature, and make a coward of him?

Very true.

And is not a man reproached for flattery and meanness who subordinates the spirited animal to the unruly monster, and, for the sake of money, of which he can never have enough, habituates him in the days of his youth to be trampled in the mire, and from being a lion to become a monkey?

True, he said.

And why are mean employments and manual arts a reproach? Only because they imply a natural weakness of the higher principle; the individual is unable to control the creatures within him, but has to court them, and his great study is how to flatter them.

Such appears to be the reason.

And therefore, being desirous of placing him under a rule like that of the best, we say that he ought to be the servant of the best, in whom the Divine rules; not, as Thrasymachus supposed, to the injury of the servant, but because everyone had better be ruled by divine wisdom dwelling within him; or, if this be impossible, then by an external authority, in order that we may be all, as far as possible, under the same government, friends and equals.

True, he said.

And this is clearly seen to be the intention of the law, which is the ally of the whole city; and is seen also in the authority which we exercise over children, and the refusal to let them be free until we have established in them a principle analogous to the constitution of a State, and by cultivation of this higher element have set up in their hearts a guardian and ruler like our own, and when this is done they may go their ways.

Yes, he said, the purpose of the law is manifest.

From what point of view, then, and on what ground can we say that a man is profited by injustice or intemperance or other baseness, which will make him a worse man, even though he acquire money or power by his wickedness?

From no point of view at all.

What shall he profit, if his injustice be undetected and unpunished? He who is undetected only gets worse, whereas he who is detected and punished has the brutal part of his nature silenced and humanized; the gentler element in him is liberated, and his whole soul is perfected and ennobled by the acquirement of justice and temperance and wisdom, more than the body ever is by receiving gifts of beauty, strength, and health, in proportion as the soul is more honorable than the body.

Certainly, he said.

To this nobler purpose the man of understanding will devote the energies of his life. And in the first place, he will honor studies which impress these qualities on his soul, and will disregard others?

Clearly, he said.

In the next place, he will regulate his bodily habit and training, and so far will he be from yielding to brutal and irrational pleasures, that he will regard even health as quite a secondary matter; his first object will be not that he may be fair or strong or well, unless he is likely thereby to gain temperance, but he will always desire so to attemper the body as to preserve the harmony of the soul?

Certainly he will, if he has true music in him.

And in the acquisition of wealth there is a principle of order and harmony which he will also observe; he will not allow himself to be dazzled by the foolish applause of the world, and heap up riches to his own infinite harm?

Certainly not, he said.

He will look at the city which is within him, and take heed that no disorder occur in it, such as might arise either from superfluity or from want; and upon this principle he will regulate his property and gain or spend according to his means.

Very true.

And, for the same reason, he will gladly accept and enjoy such honors as he deems likely to make him a better man; but those, whether private or public, which are likely to disorder his life, he will avoid?

Then, if that is his motive, he will not be a statesman.

By the dog of Egypt, he will! in the city which is his own he certainly will, though in the land of his birth perhaps not, unless he have a divine call.

I understand; you mean that he will be a ruler in the city of which we are the founders, and which exists in idea only; for I do not believe that there is such a one anywhere on earth?

In heaven, I replied, there is laid up a pattern of it, methinks, which he who desires may behold, and beholding, may set his own house in order. But whether such a one exists, or ever will exist in fact, is no matter; for he will live after the manner of that city, having nothing to do with any other.

I think so, he said.

* * * *

Book X: The Recompense Of Life

(Socrates, Glaucon.)

OF the many excellences which I perceive in the order of our State, there is none which upon reflection pleases me better than the rule about poetry.

To what do you refer?

To the rejection of imitative poetry, which certainly ought not to be received; as I see far more clearly now that the parts of the soul have been distinguished.

What do you mean?

Speaking in confidence, for I should not like to have my words repeated to the tragedians and the rest of the imitative tribe -- but I do not mind saying to you, that all poetical imitations are ruinous to the understanding of the hearers, and that the knowledge of their true nature is the only antidote to them.

Explain the purport of your remark.

Well, I will tell you, although I have always from my earliest youth had an awe and love of Homer, which even now makes the words falter on my lips, for he is the great captain and teacher of the whole of that charming tragic company; but a man is not to be reverenced more than the truth, and therefore I will speak out.

Very good, he said.

Listen to me, then, or, rather, answer me.

Put your question.

Can you tell me what imitation is? for I really do not know.

A likely thing, then, that I should know.

Why not? for the duller eye may often see a thing sooner than the keener.

Very true, he said; but in your presence, even if I had any faint notion, I could not muster courage to utter it. Will you inquire yourself? Well, then, shall we begin the inquiry in our usual manner: Whenever a number of individuals have a common name, we assume them to have also a corresponding idea or form; do you understand me?

I do.

Let us take any common instance; there are beds and tables in the world -- plenty of them, are there not?

Yes.

But there are only two ideas or forms of them -- one

the idea of a bed, the other of a table.

True.

And the maker of either of them makes a bed or he makes a table for our use, in accordance with the idea -- that is our way of speaking in this and similar instances -- but no artificer makes the ideas themselves: how could he?

Impossible.

And there is another artist -- I should like to know what you would say of him.

Who is he?

One who is the maker of all the works of all other workmen.

What an extraordinary man!

Wait a little, and there will be more reason for your saying so. For this is he who is able to make not only vessels of every kind, but plants and animals, himself and all other things -- the earth and heaven, and the things which are in heaven or under the earth; he makes the gods also.

He must be a wizard and no mistake.

Oh! you are incredulous, are you? Do you mean that there is no such maker or creator, or that in one sense there might be a maker of all these things, but in another not? Do you see that there is a way in which you could make them all yourself?

What way?

An easy way enough; or rather, there are many ways in which the feat might be quickly and easily accomplished, none quicker than that of turning a mirror round and round -- you would soon enough make the sun and the heavens, and the earth and yourself, and other animals and plants, and all the other things of which we were just now speaking, in the mirror.

Yes, he said; but they would be appearances only.

Very good, I said, you are coming to the point now. And the painter, too, is, as I conceive, just such another -- a creator of appearances, is he not?

Of course.

But then I suppose you will say that what he creates is untrue. And yet there is a sense in which the painter also creates a bed?

Yes, he said, but not a real bed.

And what of the maker of the bed? were you not saying

that he too makes, not the idea which, according to our view, is the essence of the bed, but only a particular bed?

Yes, I did.

Then if he does not make that which exists he cannot make true existence, but only some semblance of existence; and if anyone were to say that the work of the maker of the bed, or of any other workman, has real existence, he could hardly be supposed to be speaking the truth.

At any rate, he replied, philosophers would say that he was not speaking the truth.

No wonder, then, that his work, too, is an indistinct expression of truth.

No wonder.

Suppose now that by the light of the examples just offered we inquire who this imitator is?

If you please. Well, then, here are three beds: one existing in nature, which is made by God, as I think that we may say -- for no one else can be the maker?

No.

There is another which is the work of the carpenter?

Yes.

And the work of the painter is a third?

Yes.

Beds, then, are of three kinds, and there are three artists who superintend them: God, the maker of the bed, and the painter?

Yes, there are three of them.

God, whether from choice or from necessity, made one bed in nature and one only; two or more such ideal beds neither ever have been nor ever will be made by God.

Why is that?

Because even if He had made but two, a third would still appear behind them which both of them would have for their idea, and that would be the ideal bed and not the two others.

Very true, he said.

God knew this, and he desired to be the real maker of a real bed, not a particular maker of a particular bed, and therefore he created a bed which is essentially and by nature one only.

So we believe.

Shall we, then, speak of him as the natural author or maker of the bed?

Yes, he replied; inasmuch as by the natural process of creation he is the author of this and of all other things.

And what shall we say of the carpenter -- is not he also the maker of the bed?

Yes.

But would you call the painter a creator and maker?

Certainly not.

Yet if he is not the maker, what is he in relation to the bed?

I think, he said, that we may fairly designate him as the imitator of that which the others make.

Good, I said; then you call him who is third in the descent from nature an imitator?

Certainly, he said.

And the tragic poet is an imitator, and, therefore, like all other imitators, he is thrice removed from the king and from the truth?

That appears to be so.

Then about the imitator we are agreed. And what about the painter? I would like to know whether he may be thought to imitate that which originally exists in nature, or only the creations of artists?

The latter.

As they are or as they appear? you have still to determine this.

What do you mean?

I mean, that you may look at a bed from different points of view, obliquely or directly or from any other point of view, and the bed will appear different, but there is no difference in reality. And the same of all things.

Yes, he said, the difference is only apparent.

Now let me ask you another question: Which is the art of painting designed to be -- an imitation of things as they are, or as they appear -- of appearance or of reality?

Of appearance.

Then the imitator, I said, is a long way off the truth, and can do all things because he lightly touches on a small part of them, and that part an image. For example: A painter

will paint a cobbler, carpenter, or any other artist, though he knows nothing of their arts; and, if he is a good artist, he may deceive children or simple persons, when he shows them his picture of a carpenter from a distance, and they will fancy that they are looking at a real carpenter.

Certainly.

And whenever anyone informs us that he has found a man who knows all the arts, and all things else that anybody knows, and every single thing with a higher degree of accuracy than any other man -- whoever tells us this, I think that we can only imagine him to be a simple creature who is likely to have been deceived by some wizard or actor whom he met, and whom he thought allknowing, because he himself was unable to analyze the nature of knowledge and ignorance and imitation.

Most true.

And so, when we hear persons saying that the tragedians, and Homer, who is at their head, know all the arts and all things human, virtue as well as vice, and divine things too, for that the good poet cannot compose well unless he knows his subject, and that he who has not this knowledge can never be a poet, we ought to consider whether here also there may not be a similar illusion. Perhaps they may have come across imitators and been deceived by them; they may not have remembered when they saw their works that these were but imitations thrice removed from the truth, and could easily be made without any knowledge of the truth, because they are appearances only and not realities? Or, after all, they may be in the right, and poets do really know the things about which they seem to the many to speak so well?

The question, he said, should by all means be considered.

Now do you suppose that if a person were able to make the original as well as the image, he would seriously devote himself to the imagemaking branch? Would he allow imitation to be the ruling principle of his life, as if he had nothing higher in him?

I should say not.

The real artist, who knew what he was imitating, would be interested in realities and not in imitations; and would desire to leave as memorials of himself works many and fair; and, instead of being the author of encomiums, he would prefer to be the theme of them.

Yes, he said, that would be to him a source of much greater honor and profit.

Then, I said, we must put a question to Homer; not about medicine, or any of the arts to which his poems only incidentally refer: we are not going to ask him, or any other poet, whether he has cured patients like Asclepius, or left behind him a school of medicine such as the Asclepiads

were, or whether he only talks about medicine and other arts at secondhand; but we have a right to know respecting military tactics, politics, education, which are the chiefest and noblest subjects of his poems, and we may fairly ask him about them. "Friend Homer," then we say to him, "if you are only in the second remove from truth in what you say of virtue, and not in the third -- not an image maker or imitator -- and if you are able to discern what pursuits make men better or worse in private or public life, tell us what State was ever better governed by your help? The good order of Lacedaemon is due to Lycurgus, and many other cities, great and small, have been similarly benefited by others; but who says that you have been a good legislator to them and have done them any good? Italy and Sicily boast of Charondas, and there is Solon who is renowned among us; but what city has anything to say about you?" Is there any city which he might name?

I think not, said Glaucon; not even the Homerids themselves pretend that he was a legislator.

Well, but is there any war on record which was carried on successfully by him, or aided by his counsels, when he was alive?

There is not.

Or is there any invention of his, applicable to the arts or to human life, such as Thales the Milesian or Anacharsis the Scythian, and other ingenious men have conceived, which is attributed to him?

There is absolutely nothing of the kind.

But, if Homer never did any public service, was he privately a guide or teacher of any? Had he in his lifetime friends who loved to associate with him, and who handed down to posterity a Homeric way of life, such as was established by Pythagoras, who was so greatly beloved for his wisdom, and whose followers are to this day quite celebrated for the order which was named after him?

Nothing of the kind is recorded of him. For, surely, Socrates, Creophylus, the companion of Homer, that child of flesh, whose name always makes us laugh, might be more justly ridiculed for his stupidity, if, as is said, Homer was greatly neglected by him and others in his own day when he was alive?

Yes, I replied, that is the tradition. But can you imagine, Glaucon, that if Homer had really been able to educate and improve mankind -- if he had possessed knowledge, and not been a mere imitator -- can you imagine, I say, that he would not have had many followers, and been honored and loved by them? Protagoras of Abdera and Prodicus of Ceos and a host of others have only to whisper to their contemporaries: "You will never be able to manage either your own house or your own State until you appoint us to be your ministers of education" -- and this ingenious device of theirs has such an effect in making men love them that their companions all but carry them about on their shoulders. And

is it conceivable that the contemporaries of Homer, or again of Hesiod, would have allowed either of them to go about as rhapsodists, if they had really been able to make mankind virtuous? Would they not have been as unwilling to part with them as with gold, and have compelled them to stay at home with them? Or, if the master would not stay, then the disciples would have followed him about everywhere, until they had got education enough?

Yes, Socrates, that, I think, is quite true.

Then must we not infer that all these poetical individuals, beginning with Homer, are only imitators; they copy images of virtue and the like, but the truth they never reach? The poet is like a painter who, as we have already observed, will make a likeness of a cobbler though he understands nothing of cobbling; and his picture is good enough for those who know no more than he does, and judge only by colors and figures.

Quite so.

In like manner the poet with his words and phrases may be said to lay on the colors of the several arts, himself understanding their nature only enough to imitate them; and other people, who are as ignorant as he is, and judge only from his words, imagine that if he speaks of cobbling, or of military tactics, or of anything else, in metre and harmony and rhythm, he speaks very well -- such is the sweet influence which melody and rhythm by nature have. And I think that you must have observed again and again what a poor appearance the tales of poets make when stripped of the colors which music puts upon them, and recited in simple prose.

Yes, he said.

They are like faces which were never really beautiful, but only blooming; and now the bloom of youth has passed away from them?

Exactly.

Here is another point: The imitator or maker of the image knows nothing of true existence; he knows appearances only. Am I not right?

Yes.

Then let us have a clear understanding, and not be satisfied with half an explanation.

Proceed.

Of the painter we say that he will paint reins, and he will paint a bit?

Yes.

And the worker in leather and brass will make them?

Certainly.

But does the painter know the right form of the bit and reins? Nay, hardly even the workers in brass and leather who make them; only the horseman who knows how to use them -- he knows their right form.

Most true.

And may we not say the same of all things?

What?

That there are three arts which are concerned with all things: one which uses, another which makes, a third which imitates them?

Yes.

And the excellence or beauty or truth of every structure, animate or inanimate, and of every action of man, is relative to the use for which nature or the artist has intended them.

True.

Then the user of them must have the greatest experience of them, and he must indicate to the maker the good or bad qualities which develop themselves in use; for example, the fluteplayer will tell the flutemaker which of his flutes is satisfactory to the performer; he will tell him how he ought to make them, and the other will attend to his instructions?

Of course.

The one knows and therefore speaks with authority about the goodness and badness of flutes, while the other, confiding in him, will do what he is told by him?

True.

The instrument is the same, but about the excellence or badness of it the maker will only attain to a correct belief; and this he will gain from him who knows, by talking to him and being compelled to hear what he has to say, whereas the user will have knowledge?

True.

But will the imitator have either? Will he know from use whether or no his drawing is correct or beautiful? or will he have right opinion from being compelled to associate with another who knows and gives him instructions about what he should draw?

Neither.

Then he will no more have true opinion than he will have knowledge about the goodness or badness of his imitations?

I suppose not.

The imitative artist will be in a brilliant state of intelligence about his own creations?

Nay, very much the reverse.

And still he will go on imitating without knowing what makes a thing good or bad, and may be expected therefore to imitate only that which appears to be good to the ignorant multitude?

Just so.

Thus far, then, we are pretty well agreed that the imitator has no knowledge worth mentioning of what he imitates. Imitation is only a kind of play or sport, and the tragic poets, whether they write in iambic or in heroic verse, are imitators in the highest degree?

Very true.

And now tell me, I conjure you, has not imitation been shown by us to be concerned with that which is thrice removed from the truth?

Certainly.

And what is the faculty in man to which imitation is addressed?

What do you mean?

I will explain: The body which is large when seen near, appears small when seen at a distance?

True.

And the same objects appear straight when looked at out of the water, and crooked when in the water; and the concave becomes convex, owing to the illusion about colors to which the sight is liable. Thus every sort of confusion is revealed within us; and this is that weakness of the human mind on which the art of conjuring and of deceiving by light and shadow and other ingenious devices imposes, having an effect upon us like magic.

True.

And the arts of measuring and numbering and weighing come to the rescue of the human understanding -- there is the beauty of them -- and the apparent greater or less, or more or heavier, no longer have the mastery over us, but give way before calculation and measure and weight?

Most true.

And this, surely, must be the work of the calculating and rational principle in the soul?

To be sure.

And when this principle measures and certifies that some things are equal, or that some are greater or less than others, there occurs an apparent contradiction?

True.

But were we not saying that such a contradiction is impossible -- the same faculty cannot have contrary opinions at the same time about the same thing?

Very true.

Then that part of the soul which has an opinion contrary to measure is not the same with that which has an opinion in accordance with measure?

True.

And the better part of the soul is likely to be that which trusts to measure and calculation?

Certainly.

And that which is opposed to them is one of the inferior principles of the soul?

No doubt.

This was the conclusion at which I was seeking to arrive when I said that painting or drawing, and imitation in general, when doing their own proper work, are far removed from truth, and the companions and friends and associates of a principle within us which is equally removed from reason, and that they have no true or healthy aim.

Exactly.

The imitative art is an inferior who marries an inferior, and has inferior offspring.

Very true.

And is this confined to the sight only, or does it extend to the hearing also, relating in fact to what we term poetry?

Probably the same would be true of poetry.

Do not rely, I said, on a probability derived from the analogy of painting; but let us examine further and see whether the faculty with which poetical imitation is concerned is good or bad.

By all means.

We may state the question thus: Imitation imitates the actions of men, whether voluntary or involuntary, on which, as they imagine, a good or bad result has ensued, and they rejoice or sorrow accordingly. Is there anything more?

No, there is nothing else.

But in all this variety of circumstances is the man at unity with himself -- or, rather, as in the instance of sight there were confusion and opposition in his opinions about the same things, so here also are there not strife and inconsistency in his life? though I need hardly raise the question again, for I remember that all this has been already admitted; and the soul has been acknowledged by us to be full of these and ten thousand similar oppositions occurring at the same moment?

And we were right, he said.

Yes, I said, thus far we were right; but there was an omission which must now be supplied.

What was the omission?

Were we not saying that a good man, who has the misfortune to lose his son or anything else which is most dear to him, will bear the loss with more equanimity than another?

Yes.

But will he have no sorrow, or shall we say that although he cannot help sorrowing, he will moderate his sorrow?

The latter, he said, is the truer statement.

Tell me: will he be more likely to struggle and hold out against his sorrow when he is seen by his equals, or when he is alone?

It will make a great difference whether he is seen or not.

When he is by himself he will not mind saying or doing many things which he would be ashamed of anyone hearing or seeing him do?

True.

There is a principle of law and reason in him which bids him resist, as well as a feeling of his misfortune which is forcing him to indulge his sorrow?

True.

But when a man is drawn in two opposite directions, to and from the same object, this, as we affirm, necessarily implies two distinct principles in him?

Certainly.

One of them is ready to follow the guidance of the law?

How do you mean?

The law would say that to be patient under suffering is best, and that we should not give way to impatience, as there is no knowing whether such things are good or evil; and nothing is gained by impatience; also, because no human thing is of serious importance, and grief stands in the way of that which at the moment is most required.

What is most required? he asked.

That we should take counsel about what has happened, and when the dice have been thrown order our affairs in the way which reason deems best; not, like children who have had a fall, keeping hold of the part struck and wasting time in setting up a howl, but always accustoming the soul forthwith to apply a remedy, raising up that which is sickly and fallen, banishing the cry of sorrow by the healing art.

Yes, he said, that is the true way of meeting the attacks of fortune.

Yes, I said; and the higher principle is ready to follow this suggestion of reason?

Clearly.

And the other principle, which inclines us to recollection of our troubles and to lamentation, and can never have enough of them, we may call irrational, useless, and cowardly?

Indeed, we may.

And does not the latter -- I mean the rebellious principle -- furnish a great variety of materials for imitation? Whereas the wise and calm temperament, being always nearly equable, is not easy to imitate or to appreciate when imitated, especially at a public festival when a promiscuous crowd is assembled in a theatre. For the feeling represented is one to which they are strangers.

Certainly.

Then the imitative poet who aims at being popular is not by nature made, nor is his art intended, to please or to affect the rational principle in the soul; but he will prefer the passionate and fitful temper, which is easily imitated?

Clearly.

And now we may fairly take him and place him by the side of the painter, for he is like him in two ways: first, inasmuch as his creations have an inferior degree of truth -- in this, I say, he is like him; and he is also like him in being concerned with an inferior part of the soul; and therefore we shall be right in refusing to admit him into a wellordered State, because he awakens and nourishes and strengthens the feelings and impairs the reason. As in a city when the evil are permitted to have authority and the good are put out of the way, so in the soul of man, as we maintain, the imitative poet implants an evil constitution,

for he indulges the irrational nature which has no discernment of greater and less, but thinks the same thing at one time great and at another small -- he is a manufacturer of images and is very far removed from the truth.

Exactly.

But we have not yet brought forward the heaviest count in our accusation: the power which poetry has of harming even the good (and there are very few who are not harmed), is surely an awful thing?

Yes, certainly, if the effect is what you say.

Hear and judge: The best of us, as I conceive, when we listen to a passage of Homer or one of the tragedians, in which he represents some pitiful hero who is drawling out his sorrows in a long oration, or weeping, and smiting his breast -- the best of us, you know, delight in giving way to sympathy, and are in raptures at the excellence of the poet who stirs our feelings most.

Yes, of course, I know.

But when any sorrow of our own happens to us, then you may observe that we pride ourselves on the opposite quality -- we would fain be quiet and patient; this is the manly part, and the other which delighted us in the recitation is now deemed to be the part of a woman.

Very true, he said.

Now can we be right in praising and admiring another who is doing that which any one of us would abominate and be ashamed of in his own person?

No, he said, that is certainly not reasonable.

Nay, I said, quite reasonable from one point of view.

What point of view?

If you consider, I said, that when in misfortune we feel a natural hunger and desire to relieve our sorrow by weeping and lamentation, and that this feeling which is kept under control in our own calamities is satisfied and delighted by the poets; the better nature in each of us, not having been sufficiently trained by reason or habit, allows the sympathetic element to break loose because the sorrow is another's; and the spectator fancies that there can be no disgrace to himself in praising and pitying anyone who comes telling him what a good man he is, and making a fuss about his troubles; he thinks that the pleasure is a gain, and why should he be supercilious and lose this and the poem too? Few persons ever reflect, as I should imagine, that from the evil of other men something of evil is communicated to themselves. And so the feeling of sorrow which has gathered strength at the sight of the misfortunes of others is with difficulty repressed in our own.

How very true!

And does not the same hold also of the ridiculous? There are jests which you would be ashamed to make yourself, and yet on the comic stage, or indeed in private, when you hear them, you are greatly amused by them, and are not at all disgusted at their unseemliness; the case of pity is repeated; there is a principle in human nature which is disposed to raise a laugh, and this which you once restrained by reason, because you were afraid of being thought a buffoon, is now let out again; and having stimulated the risible faculty at the theatre, you are betrayed unconsciously to yourself into playing the comic poet at home.

Quite true, he said.

And the same may be said of lust and anger and all the other affections, of desire, and pain, and pleasure, which are held to be inseparable from every action -- in all of them poetry feeds and waters the passions instead of drying them up; she lets them rule, although they ought to be controlled, if mankind are ever to increase in happiness and virtue.

I cannot deny it.

Therefore, Glaucon, I said, whenever you meet with any of the eulogists of Homer declaring that he has been the educator of Hellas, and that he is profitable for education and for the ordering of human things, and that you should take him up again and again and get to know him and regulate your whole life according to him, we may love and honor those who say these things -- they are excellent people, as far as their lights extend; and we are ready to acknowledge that Homer is the greatest of poets and first of tragedy writers; but we must remain firm in our conviction that hymns to the gods and praises of famous men are the only poetry which ought to be admitted into our State. For if you go beyond this and allow the honeyed muse to enter, either in epic or lyric verse, not law and the reason of mankind, which by common consent have ever been deemed best, but pleasure and pain will be the rulers in our State.

That is most true, he said.

And now since we have reverted to the subject of poetry, let this our defence serve to show the reasonableness of our former judgment in sending away out of our State an art having the tendencies which we have described; for reason constrained us. But that she may not impute to us any harshness or want of politeness, let us tell her that there is an ancient quarrel between philosophy and poetry; of which there are many proofs, such as the saying of "the yelping hound howling at her lord," or of one "mighty in the vain talk of fools," and "the mob of sages circumventing Zeus," and the "subtle thinkers who are beggars after all"; and there are innumerable other signs of ancient enmity between them. Notwithstanding this, let us assure our sweet friend and the sister art of imitation, that if she will only prove her title to exist in a

wellordered State we shall be delighted to receive her -- we are very conscious of her charms; but we may not on that account betray the truth. I dare say, Glaucon, that you are as much charmed by her as I am, especially when she appears in Homer?

Yes, indeed, I am greatly charmed.

Shall I propose, then, that she be allowed to return from exile, but upon this condition only -- that she make a defence of herself in lyrical or some other metre?

Certainly.

And we may further grant to those of her defenders who are lovers of poetry and yet not poets the permission to speak in prose on her behalf: let them show not only that she is pleasant, but also useful to States and to human life, and we will listen in a kindly spirit; for if this can be proved we shall surely be the gainers -- I mean, if there is a use in poetry as well as a delight?

Certainly, he said, we shall be the gainers.

If her defence fails, then, my dear friend, like other persons who are enamoured of something, but put a restraint upon themselves when they think their desires are opposed to their interests, so, too, must we after the manner of lovers give her up, though not without a struggle. We, too, are inspired by that love of poetry which the education of noble States has implanted in us, and therefore we would have her appear at her best and truest; but so long as she is unable to make good her defence, this argument of ours shall be a charm to us, which we will repeat to ourselves while we listen to her strains; that we may not fall away into the childish love of her which captivates the many. At all events we are well aware that poetry being such as we have described is not to be regarded seriously as attaining to the truth; and he who listens to her, fearing for the safety of the city which is within him, should be on his guard against her seductions and make our words his law.

Yes, he said, I quite agree with you.

Yes, I said, my dear Glaucon, for great is the issue at stake, greater than appears, whether a man is to be good or bad. And what will anyone be profited if under the influence of honor or money or power, aye, or under the excitement of poetry, he neglect justice and virtue?

Yes, he said; I have been convinced by the argument, as I believe that anyone else would have been.

And yet no mention has been made of the greatest prizes and rewards which await virtue.

What, are there any greater still? If there are, they must be of an inconceivable greatness.

Why, I said, what was ever great in a short time? The whole period of threescore years and ten is surely but a

little thing in comparison with eternity?

Say rather 'nothing' he replied.

And should an immortal being seriously think of this little space rather than of the whole?

Of the whole, certainly. But why do you ask?

Are you not aware, I said, that the soul of man is immortal and imperishable?

He looked at me in astonishment, and said: No, by heaven: And are you really prepared to maintain this?

Yes, I said, I ought to be, and you too -- there is no difficulty in proving it.

I see a great difficulty; but I should like to hear you state this argument of which you make so light. Listen, then.

I am attending.

There is a thing which you call good and another which you call evil?

Yes, he replied.

Would you agree with me in thinking that the corrupting and destroying element is the evil, and the saving and improving element the good?

Yes.

And you admit that everything has a good and also an evil; as ophthalmia is the evil of the eyes and disease of the whole body; as mildew is of corn, and rot of timber, or rust of copper and iron: in everything, or in almost everything, there is an inherent evil and disease?

Yes, he said.

And anything which is infected by any of these evils is made evil, and at last wholly dissolves and dies?

True.

The vice and evil which are inherent in each are the destruction of each; and if these do not destroy them there is nothing else that will; for good certainly will not destroy them, nor, again, that which is neither good nor evil.

Certainly not.

If, then, we find any nature which having this inherent corruption cannot be dissolved or destroyed, we may be certain that of such a nature there is no destruction?

That may be assumed.

Well, I said, and is there no evil which corrupts the soul?

Yes, he said, there are all the evils which we were just now passing in review: unrighteousness, intemperance, cowardice, ignorance.

But does any of these dissolve or destroy her? -- and here do not let us fall into the error of supposing that the unjust and foolish man, when he is detected, perishes through his own injustice, which is an evil of the soul. Take the analogy of the body: The evil of the body is a disease which wastes and reduces and annihilates the body; and all the things of which we were just now speaking come to annihilation through their own corruption attaching to them and inhering in them and so destroying them. Is not this true?

Yes.

Consider the soul in like manner. Does the injustice or other evil which exists in the soul waste and consume her? Do they by attaching to the soul and inhering in her at last bring her to death, and so separate her from the body?

Certainly not.

And yet, I said, it is unreasonable to suppose that anything can perish from without through affection of external evil which could not be destroyed from within by a corruption of its own?

It is, he replied.

Consider, I said, Glaucon, that even the badness of food, whether staleness, decomposition, or any other bad quality, when confined to the actual food, is not supposed to destroy the body; although, if the badness of food communicates corruption to the body, then we should say that the body has been destroyed by a corruption of itself, which is disease, brought on by this; but that the body, being one thing, can be destroyed by the badness of the food, which is another, and which does not engender any natural infection -- this we shall absolutely deny?

Very true.

And, on the same principle, unless some bodily evil can produce an evil of the soul, we must not suppose that the soul, which is one thing, can be dissolved by any merely external evil which belongs to another?

Yes, he said, there is reason in that. Either, then, let us refute this conclusion, or, while it remains unrefuted, let us never say that fever, or any other disease, or the knife put to the throat, or even the cutting up of the whole body into the minutest pieces, can destroy the soul, until she herself is proved to become more unholy or unrighteous in consequence of these things being done to the body; but that the soul, or anything else if not

destroyed by an internal evil, can be destroyed by an external one, is not to be affirmed by any man.

And surely, he replied, no one will ever prove that the souls of men become more unjust in consequence of death.

But if someone who would rather not admit the immortality of the soul boldly denies this, and says that the dying do really become more evil and unrighteous, then, if the speaker is right, I suppose that injustice, like disease, must be assumed to be fatal to the unjust, and that those who take this disorder die by the natural inherent power of destruction which evil has, and which kills them sooner or later, but in quite another way from that in which, at present, the wicked receive death at the hands of others as the penalty of their deeds?

Nay, he said, in that case injustice, if fatal to the unjust, will not be so very terrible to him, for he will be delivered from evil. But I rather suspect the opposite to be the truth, and that injustice which, if it have the power, will murder others, keeps the murderer alive -- aye, and well awake, too; so far removed is her dwellingplace from being a house of death.

True, I said; if the inherent natural vice or evil of the soul is unable to kill or destroy her, hardly will that which is appointed to be the destruction of some other body, destroy a soul or anything else except that of which it was appointed to be the destruction.

Yes, that can hardly be.

But the soul which cannot be destroyed by an evil, whether inherent or external, must exist forever, and, if existing forever, must be immortal?

Certainly.

That is the conclusion, I said; and, if a true conclusion, then the souls must always be the same, for if none be destroyed they will not diminish in number. Neither will they increase, for the increase of the immortal natures must come from something mortal, and all things would thus end in immortality.

Very true.

But this we cannot believe -- reason will not allow us -- any more than we can believe the soul, in her truest nature, to be full of variety and difference and dissimilarity.

What do you mean? he said.

The soul, I said, being, as is now proven, immortal, must be the fairest of compositions and cannot be compounded of many elements?

Certainly not.

Her immortality is demonstrated by the previous argument, and there are many other proofs; but to see her as she really is, not as we now behold her, marred by communion with the body and other miseries, you must contemplate her with the eye of reason, in her original purity; and then her beauty will be revealed, and justice and injustice and all the things which we have described will be manifested more clearly. Thus far, we have spoken the truth concerning her as she appears at present, but we must remember also that we have seen her only in a condition which may be compared to that of the seagod Glaucus, whose original image can hardly be discerned because his natural members are broken off and crushed and damaged by the waves in all sorts of ways, and incrustations have grown over them of seaweed and shells and stones, so that he is more like some monster than he is to his own natural form. And the soul which we behold is in a similar condition, disfigured by ten thousand ills. But not there, Glaucon, not there must we look. Where, then?

At her love of wisdom. Let us see whom she affects, and what society and converse she seeks in virtue of her near kindred with the immortal and eternal and divine; also how different she would become if, wholly following this superior principle, and borne by a divine impulse out of the ocean in which she now is, and disengaged from the stones and shells and things of earth and rock which in wild variety spring up around her because she feeds upon earth, and is overgrown by the good things in this life as they are termed: then you would see her as she is, and know whether she have one shape only or many, or what her nature is. Of her affections and of the forms which she takes in this present life I think that we have now said enough.

True, he replied.

And thus, I said, we have fulfilled the conditions of the argument; we have not introduced the rewards and glories of justice, which, as you were saying, are to be found in Homer and Hesiod; but justice in her own nature has been shown to be the best for the soul in her own nature. Let a man do what is just, whether he have the ring of Gyges or not, and even if in addition to the ring of Gyges he put on the helmet of Hades.

Very true.

And now, Glaucon, there will be no harm in further enumerating how many and how great are the rewards which justice and the other virtues procure to the soul from gods and men, both in life and after death.

Certainly not, he said.

Will you repay me, then, what you borrowed in the argument?

What did I borrow?

The assumption that the just man should appear unjust and the unjust just: for you were of opinion that even if the true state of the case could not possibly escape the

eyes of gods and men, still this admission ought to be made for the sake of the argument, in order that pure justice might be weighed against pure injustice. Do you remember?

I should be much to blame if I had forgotten.

Then, as the cause is decided, I demand on behalf of justice that the estimation in which she is held by gods and men and which we acknowledge to be her due should now be restored to her by us; since she has been shown to confer reality, and not to deceive those who truly possess her, let what has been taken from her be given back, that so she may win that palm of appearance which is hers also, and which she gives to her own.

The demand, he said, is just.

In the first place, I said -- and this is the first thing which you will have to give back -- the nature both of the just and unjust is truly known to the gods.

Granted.

And if they are both known to them, one must be the friend and the other the enemy of the gods, as we admitted from the beginning?

True.

And the friend of the gods may be supposed to receive from them all things at their best, excepting only such evil as is the necessary consequence of former sins?

Certainly.

Then this must be our notion of the just man, that even when he is in poverty or sickness, or any other seeming misfortune, all things will in the end work together for good to him in life and death; for the gods have a care of anyone whose desire is to become just and to be like God, as far as man can attain the divine likeness, by the pursuit of virtue?

Yes, he said; if he is like God he will surely not be neglected by him.

And of the unjust may not the opposite be supposed?

Certainly.

Such, then, are the palms of victory which the gods give the just?

That is my conviction.

And what do they receive of men? Look at things as they really are, and you will see that the clever unjust are in the case of runners, who run well from the startingplace to the goal, but not back again from the goal: they go off at a great pace, but in the end only look foolish, slinking away with their ears draggling on their shoulders, and without a

crown; but the true runner comes to the finish and receives the prize and is crowned. And this is the way with the just; he who endures to the end of every action and occasion of his entire life has a good report and carries off the prize which men have to bestow.

True.

And now you must allow me to repeat of the just the blessings which you were attributing to the fortunate unjust. I shall say of them, what you were saying of the others, that as they grow older, they become rulers in their own city if they care to be; they marry whom they like and give in marriage to whom they will; all that you said of the others I now say of these. And, on the other hand, of the unjust I say that the greater number, even though they escape in their youth, are found out at last and look foolish at the end of their course, and when they come to be old and miserable are flouted alike by stranger and citizen; they are beaten, and then come those things unfit for ears polite, as you truly term them; they will be racked and have their eyes burned out, as you were saying. And you may suppose that I have repeated the remainder of your tale of horrors. But will you let me assume, without reciting them, that these things are true?

Certainly, he said, what you say is true.

These, then, are the prizes and rewards and gifts which are bestowed upon the just by gods and men in this present life, in addition to the other good things which justice of herself provides.

Yes, he said; and they are fair and lasting.

And yet, I said, all these are as nothing either in number or greatness in comparison with those other recompenses which await both just and unjust after death. And you ought to hear them, and then both just and unjust will have received from us a full payment of the debt which the argument owes to them.

Speak, he said; there are few things which I would more gladly hear.

Well, I said, I will tell you a tale; not one of the tales which Odysseus tells to the hero Alcinous, yet this, too, is a tale of a hero, Er the son of Armenius, a Pamphylian by birth. He was slain in battle, and ten days afterward, when the bodies of the dead were taken up already in a state of corruption, his body was found unaffected by decay, and carried away home to be buried. And on the twelfth day, as he was lying on the funeral pyre, he returned to life and told them what he had seen in the other world. He said that when his soul left the body he went on a journey with a great company, and that they came to a mysterious place at which there were two openings in the earth; they were near together, and over against them were two other openings in the heaven above. In the intermediate space there were judges seated, who commanded the just, after they had given judgment on them and had bound their

sentences in front of them, to ascend by the heavenly way on the right hand; and in like manner the unjust were bidden by them to descend by the lower way on the left hand; these also bore the symbols of their deeds, but fastened on their backs. He drew near, and they told him that he was to be the messenger who would carry the report of the other world to them, and they bade him hear and see all that was to be heard and seen in that place. Then he beheld and saw on one side the souls departing at either opening of heaven and earth when sentence had been given on them; and at the two other openings other souls, some ascending out of the earth dusty and worn with travel, some descending out of heaven clean and bright. And arriving ever and anon they seemed to have come from a long journey, and they went forth with gladness into the meadow, where they encamped as at a festival; and those who knew one another embraced and conversed, the souls which came from earth curiously inquiring about the things above, and the souls which came from heaven about the things beneath. And they told one another of what had happened by the way, those from below weeping and sorrowing at the remembrance of the things which they had endured and seen in their journey beneath the earth (now the journey lasted a thousand years), while those from above were describing heavenly delights and visions of inconceivable beauty. The story, Glaucon, would take too long to tell; but the sum was this: He said that for every wrong which they had done to anyone they suffered tenfold; or once in a hundred years -- such being reckoned to be the length of man's life, and the penalty being thus paid ten times in a thousand years. If, for example, there were any who had been the cause of many deaths, or had betrayed or enslaved cities or armies, or been guilty of any other evil behavior, for each and all of their offences they received punishment ten times over, and the rewards of beneficence and justice and holiness were in the same proportion. I need hardly repeat what he said concerning young children dying almost as soon as they were born. Of piety and impiety to gods and parents, and of murderers, there were retributions other and greater far which he described. He mentioned that he was present when one of the spirits asked another, "Where is Ardiaeus the Great?" (Now this Ardiaeus lived a thousand years before the time of Er: he had been the tyrant of some city of Pamphylia, and had murdered his aged father and his elder brother, and was said to have committed many other abominable crimes.) The answer of the other spirit was: "He comes not hither, and will never come." And this, said he, was one of the dreadful sights which we ourselves witnessed. We were at the mouth of the cavern, and, having completed all our experiences, were about to reascend, when of a sudden Ardiaeus appeared and several others, most of whom were tyrants; and there were also, besides the tyrants, private individuals who had been great criminals: they were just, as they fancied, about to return into the upper world, but the mouth, instead of admitting them, gave a roar, whenever any of these incurable sinners or someone who had not been sufficiently punished tried to ascend; and then wild men of fiery aspect, who were standing by and heard the sound, seized and carried them off; and Ardiaeus and others they bound head and foot and hand, and threw them down and flayed them with scourges, and dragged them along the road at the side, carding them on thorns like wool, and declaring

to the passersby what were their crimes, and that they were being taken away to be cast into hell. And of all the many terrors which they had endured, he said that there was none like the terror which each of them felt at that moment, lest they should hear the voice; and when there was silence, one by one they ascended with exceeding joy. These, said Er, were the penalties and retributions, and there were blessings as great.

Now when the spirits which were in the meadow had tarried seven days, on the eighth they were obliged to proceed on their journey, and, on the fourth day after, he said that they came to a place where they could see from above a line of light, straight as a column, extending right through the whole heaven and through the earth, in color resembling the rainbow, only brighter and purer; another day's journey brought them to the place, and there, in the midst of the light, they saw the ends of the chains of heaven let down from above: for this light is the belt of heaven, and holds together the circle of the universe, like the undergirders of a trireme. From these ends is extended the spindle of Necessity, on which all the revolutions turn. The shaft and hook of this spindle are made of steel, and the whorl is made partly of steel and also partly of other materials. Now the whorl is in form like the whorl used on earth; and the description of it implied that there is one large hollow whorl which is quite scooped out, and into this is fitted another lesser one, and another, and another, and four others, making eight in all, like vessels which fit into one another; the whorls show their edges on the upper side, and on their lower side all together form one continuous whorl. This is pierced by the spindle, which is driven home through the centre of the eighth. The first and outermost whorl has the rim broadest, and the seven inner whorls are narrower, in the following proportions -- the sixth is next to the first in size, the fourth next to the sixth; then comes the eighth; the seventh is fifth, the fifth is sixth, the third is seventh, last and eighth comes the second. The largest (or fixed stars) is spangled, and the seventh (or sun) is brightest; the eighth (or moon) colored by the reflected light of the seventh; the second and fifth (Saturn and Mercury) are in color like one another, and yellower than the preceding; the third (Venus) has the whitest light; the fourth (Mars) is reddish; the sixth (Jupiter) is in whiteness second. Now the whole spindle has the same motion; but, as the whole revolves in one direction, the seven inner circles move slowly in the other, and of these the swiftest is the eighth; next in swiftness are the seventh, sixth, and fifth, which move together; third in swiftness appeared to move according to the law of this reversed motion, the fourth; the third appeared fourth, and the second fifth. The spindle turns on the knees of Necessity; and on the upper surface of each circle is a siren, who goes round with them, hymning a single tone or note. The eight together form one harmony; and round about, at equal intervals, there is another band, three in number, each sitting upon her throne: these are the Fates, daughters of Necessity, who are clothed in white robes and have chaplets upon their heads, Lachesis and Clotho and Atropos, who accompany with their voices the harmony of the sirens -- Lachesis singing of the past,

Clotho of the present, Atropos of the future; Clotho from time to time assisting with a touch of her right hand the revolution of the outer circle of the whorl or spindle, and Atropos with her left hand touching and guiding the inner ones, and Lachesis laying hold of either in turn, first with one hand and then with the other.
